To
William L. Bull,
WHOSE LOYAL FRIENDSHIP AND DEEP SYMPATHY
IN THE AIMS OF THIS WORK
HAS LARGELY MADE IT POSSIBLE.

P R E F A C E .

THE two main requisites of an encyclopedia are reliability and serviceableness in information. The first of these requisites has been sought in this encyclopedia by having every article either written or revised by some specialist on each particular subject. In the case of all proposed reforms the statement of the reform has been written, or at least revised, by a believer in the reform ; but, together with this, or by reference to a corresponding article on the opposing side, a statement of the opposing view will be found. Individualists and socialists, gold monometal- lists, bimetallists, and believers in free silver, protectionists and free traders, prohibitionists and high-license advocates, believers and disbelievers in woman suffrage, appear in this ency- clopedia side by side. Historical, bibliographical, biographical, and statistical articles have been prepared and carefully revised by adequate authorities, mainly university professors and specialists.

Serviceableness has been sought by making the work, while, as shown above, accurate and scholarly, yet popular and not technical. The encyclopedia is for general workers and students in social reform. It has been prepared by specialists for those who are not specialists. Its references to books are therefore in the main only to books available to English readers. Articles have been arranged as to length and quality with this idea of serviceableness in view. No articles, for example, will be found upon Presidents Washington and Lincoln. This is not because they did not contribute to social reform, and to a much larger degree than many who are considered in this encyclopedia, but because the general reader in reform does not need the story of Washington's or Lincoln's life. The space allotted to articles, therefore, has considered the needs of the reader more than the absolute importance of the subject.

This work is a pioneer, the first of its kind. Its aim has been to give on all the broad range of social reform the experience of the past, the facts of the present, the proposals for the future.

The subject is so vast, and may be made so inclusive, that almost any subject might have been included here ; but this encyclopedia aims to distinguish sharply between subjects that belong mainly to the individual and those that belong mainly to society. A few subjects, such as religion, science, etc., that concern both the individual and society, are treated only in their social aspects. The biographical portions will be found to be especially full. Of living persons the encyclopedia treats only those having national recognition, and has thus been compelled to pass by many earnest and often more useful and successful workers in local fields.

To the important articles are appended brief bibliographies of the best available books upon the subject. There has been no attempt to make these exhaustive, but they will serve to guide the student in his search for more complete information. A general bibliography of social and economic bibliographies will be found in the appendix.

The editor desires to express his indebtedness to a large number of writers who have most

materially aided him by contributing or revising articles and by reading proof. The names of those who have contributed or revised signed articles will be found below. But there are many others whose names do not appear who have aided equally with these. A list of the firms who have granted courteous permission to quote from their publications is also appended. The editor desires to express his especial indebtedness to Mr. Louis E. Van Norman, A.M., for valued help in seeing the work through the press.

If this work shall aid at all those who desire the truth in finding and in acting upon it, its aim will have been realized.

BOSTON, 1897.

THE ENCYCLOPEDIA OF SOCIAL REFORM.

ABANDONED FARMS.—The growth of modern commercial centers, the development of factory towns, the increasing part played in economic life by the railroad, the general drift of population from the country to the cities (see **CITIES**) have led, in certain sections of the country, to the abandoning of farms. The extent to which this has taken place has been by some exaggerated, and the prominence given to the subject a few years ago led to investigations which have shown the exaggeration; nevertheless, the number of abandoned farms is not small, and the fact has a significance of the most serious character. As we shall see in this article, the evil is not confined to New England, altho most attention has been called to the fact in that section of the country.

Maine, New Hampshire, Vermont, and Massachusetts have made careful statistical investigations into the subject, with the result (1) of finding that the extent to which farms in New England have been abandoned has been somewhat exaggerated; and (2) of inducing the State to take steps to aid the sale and development of such farms, steps which have culminated in practical results. These States print lists of such farms for sale at favorable terms and send them free to any person who applies to the proper authorities of the respective States. Many farms have been thus sold and land developed and homes maintained.

Altho, perhaps, New Hampshire and Vermont have been most active in thus selling farms, Massachusetts has most carefully investigated and reported upon the subject. The twenty-first annual report (1890) of the Massachusetts Bureau of Statistics of Labor gives 78 pages to the subject, from which we quote the prominent points.

"Many farms in the commonwealth have been abandoned by their owners, but not abandoned as to cultivation. Such farms have been leased to their present occupants, who derive a

Definition of Abandoned Farms. living from them, or have been sold to other farmers and incorporated with other farms. The result of the transfers last indicated is to reduce the number of farms in the State, but not the number of acres of cultivated land.

Many farms formerly cultivated for various crops are now mainly devoted to the production of hay or dairy

products; and, in some cases, land formerly cultivated is now to be classed as woodland. Such changes are merely changes in the form of crop, and if made by the farmer for the reason that, all things considered, it is found more profitable at present to raise hay, dairy products, or wood than vegetables or grain, do not involve an abandonment of the farm, altho possibly the abandonment of the mode of cultivation formerly employed. In order to secure uniformity and the greatest possible accuracy in the returns, and to eliminate as far as possible the effect of differences of judgment, in replying to our inquiries as to what should be considered an abandoned farm, the following definition was placed upon the blanks sent out to the assessors:

"By 'Abandoned Farms' in this inquiry are meant those formerly cultivated, but now deserted, upon which cultivation is now abandoned, and the buildings, if any, unoccupied and permitted to fall into decay. In some cases the grass is still cut on these farms, but nothing is done in the way of enrichment of the soil, and the land is practically unproductive and left to run wild."

Abandoned farm land in Massachusetts is principally confined to the western counties. Such land aggregates 3.45 per cent. of the total farm acreage of the State, outside the limits of cities, and about 0.87 per cent. of the value of such farm land. In Nantucket and Suffolk counties no abandoned farm land is returned. The percentage of acreage of abandoned farm land of total farm acreage, for the counties returning abandoned farm land, is highest in Hampshire County, reaching therein 6.85 per cent. It is lowest in Essex County, being therein only 0.06 per cent.

The average size of abandoned farms with buildings is 86 acres, and for those without buildings 87 acres. The average value of abandoned farms with buildings is \$894, and for those without buildings \$561. The average value of buildings on abandoned farms is \$337 per farm, ranging much less than the average value of buildings upon farms under cultivation. Much of the abandoned land may be bought for less than \$10 per acre.

While some of the towns containing abandoned farms show a recent decline in the value of agricultural products and property, this is not universally true, and the decline in certain localities is overbalanced by increase in others in the same county; so that, notwithstanding the existence of abandoned farms, each county, except Nantucket, shows an increase since 1875 in the value of agricultural products, and every county shows an increase in the value of agricultural property. In some counties, also, an increase in the acreage of land under cultivation appears.

Except in Barnstable and Dukes counties, the towns reporting abandoned farms show an aggregate increase in population since 1865; and, except in Barnstable, Dukes, and Franklin counties, an increase since 1855. The increase is not usually so great, however, as appears in the other towns in the counties respectively. In the towns containing abandoned farms, and having no important manufacturing industries, a decline in population generally appears.

Summary of Results.

The abandonment of farming land is not entirely of recent date, altho it is still going on. Replies respecting this phase of the subject, made to the

Causes for Abandonment of Farms.

Secretary of the Board of Agriculture from 77 different localities, indicate that in 43 of these the number of abandoned farms is no greater than existed 10 years ago; in 25 the number was considered greater, in five it was believed to be less, while in four instances the replies indicated conditions similar to those prevailing at the earlier date.

The following language may be thought appropriate to the present day:

"Where is that long line of noble farmers that were so industrious and prosperous, extending from North River over Christian Hill to the Green Mountains, and those cattle drovers and merchants that did more business than all the stores in a half dozen Western towns to-day? All are gone. . . . Look over this town, and see the once expensive private dwellings going to ruin in strange hands. They show that far back a high order of architecture existed here, and that a wealthy and prosperous set of farmers and mechanics occupied them. They are now in decay. The same thing may be seen, in a greater or less degree, in most of the rural districts of New England."

However appropriate this may now appear, it was written 23 years ago, and formed part of an address delivered to his neighbors by a citizen of western Massachusetts.

If the evil is not recent, neither is it local. It is not confined to Massachusetts, to New England, to the West, wherein, it is said, more farms have been deserted by their owners than in the East, nor to the United States. It is one of the features of modern civilization. While it is possible to accept that civilization is, upon the whole, good, no one, unless ultra-conservative, can accept it as a finality, or refuse to recognize the evils peculiar to it.

It is not necessary to enlarge upon the causes which have led to the abandonment of farming land. No single cause can be given. If it were otherwise a remedy might be easily suggested. There are many factors which have contributed to the result, either directly or indirectly. Among others, which admit of no dispute, are the inadaptability of some of the land to the use of machinery and modern modes of cultivation, the poorer quality of the soil in one locality as compared with that in another, or its remoteness from markets or from the railway which communicates with markets; and beyond these, everything which has aided the growths of cities has at the same time tended to reduce the population of the remote towns.

It must be remembered that the abandonment of farming land does not always imply either the abandonment or the decline of agriculture. On the contrary, notwithstanding this decline in some sections, an increase in other sections appears. A careful study of the tables relative to agricultural products and property will show that the increase is generally greatest in the vicinity of the large towns. These towns afford a ready market for perishable products, and this fact has led to a gradual change in the agriculture of the State, which, developing along the lines of easiest resistance, has found its greatest profits in the products of the market garden and the dairy. Of this sort of agriculture there is considerable within the territorial limits of the cities themselves. The farmer near the large towns has frequently an advantage over those in the remote places, in his ability to sell his crops directly without the intervention of the middleman. There are economic reasons, therefore, growing out of the changed conditions of modern life, which have operated to draw some who have not yet abandoned agriculture into the proximity of cities.

Every new census discloses a larger proportion of our population within city limits, and nothing provokes more criticism than the failure of a city or large town to maintain in the census returns its expected percentage of growth. This growth is considered an evidence of progress, but it should be remembered that rapid growth in cities cannot be secured without retarding the growth in the country districts. In Massachusetts the immigrant seeks the city and factory town. Often he comes from an agricultural life, and desires a change. A movement from the city toward the country would perhaps correct the evil of abandoned farms, but it would also check the growth of the city. In the present state of public opinion, which is largely controlled by the cities, and will be so controlled to a still greater extent in the future, any such movement, if extensive enough to be effective,

would at once be regarded as evidence of decadence in the cities affected by it.

The larger towns and cities are constantly engaged in organized efforts to attract population by the introduction of new industries, by improving their systems of water supply and drainage, by increasing the efficiency of their public schools, by the establishment of public libraries and parks—that is, by making it possible to improve one's pecuniary position by residence within them, through the opportunity afforded for regular and remunerative employment, not, like agriculture, subject to the contingencies of the seasons, and by enlarging the social advantages which are to-day deemed essential. Such efforts are considered commendable. It ought to be recognized, however, that their success involves a drain upon less favored municipalities.

The concentration of population and wealth in cities and large towns, while it has its dangers, unquestionably opens enlarged social opportunities to all classes, even the poorest. There is, too, a strange fascination in city life which has always existed, and which leads many who are under its spell to poverty and privation in the city to independence and comfort in the country. This fascination is intensified by the undoubted benefits which the modern city offers to those within or near it.

The delights of a country life and the independence of the farmer are prolific themes of poets everywhere. Unfortunately, the masses of the people have usually, for various reasons, declined to take the same view. No doubt the poets are right, but men have to be raised above the ordinary level to enable them to accept such a conclusion. It is probably the existence of conditions more or less artificial that makes a city life seem preferable to so many, but these conditions have prevailed so long, and tend in so many ways to perpetuate themselves, that they cannot at once be changed.

And yet it must be admitted that the promise which leads to the abandonment of country life is frequently unfulfilled. The movement from the country toward the city may affect, indeed, has affected, the labor market in two ways: it may lead to a dearth of agricultural labor in the depleted districts, thus adding to the burdens, which in too many cases the farmer already bears, and it may intensify the competition to which the city laborer is subjected, both as to employment and as to wages. This competition reacts upon those who come to the city for the purpose of improving their fortunes only to find the opportunities open to them constantly growing less. On the other hand, the life of the farmer, notwithstanding its burdens, was never so easy in many respects as at present. . . . It could be easily shown that the hardships and poverty among farmers in the early part of the century were much greater than they are to-day. The improvements due to modern invention have lightened farm labor, while the railroad, the telegraph, and the press have brought the most retired farms into communication with the activities of the age. The farmer may not be able to amass wealth, nor can the majority of those in cities hope to do so. He is generally sure of a comfortable living as the reward of his toil, and the contingencies that affect his employment are usually no greater than those affecting employment in cities. If opportunities for large profits are not open to him, he is relieved from the risk incidental to such opportunities. That some of the burdens under which he suffers might be and ought to be removed is undeniable, but there are those in the city, working for low wages, liable to periodical unemployment, to whom life upon the abandoned farms would offer an agreeable change; only they must first be convinced that such a change is desirable.

It is sometimes assumed that there are many in our cities who would gladly go back to the land, if land were obtainable. This report shows that such land exists. Much of it is in towns which for natural beauty of scenery and healthfulness of situation are unsurpassed in Massachusetts. These towns have an honorable past and still possess possibilities of growth. In many of them, as we have shown, agriculture still flourishes, and, presumably, many of the abandoned farms could be brought back to fertility, and become once more the sites of prosperous and happy homes. If this could be accomplished it would be a public benefit. Can legislation afford any aid?

Many of the towns containing abandoned farms have small opportunity, compared with that possessed by the larger places, to make their advantages known.

Can the Abandoned Farms be Reclaimed?

These advantages are by no means inconsiderable. Some of the abandoned land is no doubt rocky and poor, but it is not all of this class. In some cases, where its reclamation for agricultural purposes is impracticable, it could be developed for summer residence by those who would be glad to avail themselves of it, if its exact condition were known. Occupancy of this sort would be of benefit to the town inviting it. For most of the land the price is low, and probably much of it could be bought for occupation at a small outlay in cash.

The States of New Hampshire and Vermont have undertaken to colonize their abandoned land, which is more extensive than exists in Massachusetts, and have invited immigration especially to that end.

So far the Massachusetts Bureau. The Maine Labor Bureau for 1890 (p. 96) reports in that State 3318 abandoned farms and an average acreage of 767. The Legislature of Vermont in 1892 ordered a complete report as to its 376 farms said to be unoccupied, but found only 200 to be really so. New Hampshire in 1892 published a list of 322 farms for sale with vacant buildings, the list being entitled "Secure a Home in New Hampshire."

In certain localities the abandonment of farms is still more marked.

In 1889 the Commissioner of Agriculture and Manufacturing Interests in Vermont issued a circular, stating that in the town of Reading there were 4000 acres of land offered for sale at \$1 or \$2 per acre. One half of these, he says, "are lands which formerly comprised good farms, but with buildings now gone, and fast growing up to timber; and some of this land is used for pasturage, and on other portions the fences are not kept up, leaving old cellar-holes and miles of stone walls to testify to former civilization." In the town of Vershire "there are from 35 to 40 farms, contiguous or nearly so, abandoned and unoccupied." In the town of Wilmington there were 5000 acres in the same condition (*The Nation*, No. 1266).

Statistics. But the condition is by no means peculiar to New England. A correspondent of the *New York Nation*, under date of November 23, 1889, wrote: "In the rural districts in Wayne County (New York) there are no less than 400 empty houses. The town of Sodus alone has over 50 deserted houses, and Huron has 30 or more."

In Michigan there were 7419 fewer farmers in 1890 than in 1880, tho the population had meanwhile increased 457,000 (Ninth Annual Report of Bureau of Labor Statistics for Michigan, 1892).

Concerning the general depletion of agricultural sections, Dr. Josiah Strong gives the following statements and tables taken from census reports. (*The New Era*, pp. 167 and 164).

Of the 1502 townships in New England, 932, or 62 per cent., were more or less depleted. In New York 69.5 per cent. lost population; in Ohio, 58 per cent.; in Indiana, 49 per cent.; in Illinois, 54 per cent. The accompanying table shows that the movement was common to the South and West as well as to the Middle and Eastern States, tho the rural districts in the region of large cities naturally felt their attraction most.

	Number of Townships.	Number of Townships which lost Population, 1880-90.
Nebraska.....	526	58

ABBOTT, Rev. LYMAN, D.D., born December 18, 1835, at Roxbury, Mass., was the third son of Rev. Jacob Abbott. He graduated at New York University in 1853, and studied and practised law with his elder brothers Benjamin Vaughan and Austin. He wrote various law articles, and together the brothers published law books, and under the *nom de plume* of "Benauly" they wrote the novel *Concutt Corners*, advocating the prohibitory temperance laws. Lyman Abbott later withdrew from the firm, and after studying theology with his uncle, the Rev. John S. C. Abbott, accepted a ministerial charge over the Congregational Church of Terre Haute, Ind., in 1860. In 1865 he became associated with the American Freedmen's Union Commission as its general secretary. In 1866 he received and accepted a call to the New England Congregational Church in New York City, resigning in 1869. In 1871 he became editor of the *Illustrated Christian Weekly*, resigning it in the autumn of 1876 to assume, with

Henry Ward Beecher, the joint-editorship of the *Christian Union* of New York City. The paper was published under the double management until the autumn of 1881, when Mr. Beecher withdrew and Mr. Abbott became editor-in-chief.

It is here that Dr. Abbott has done his main work for social reform, his paper being the *first general religious journal* in the United States, if not in the world, to take up in any decisive way the labor question. Early articles in the *Christian Union* by Drs. Washington Gladden, P. S. Moxom, J. H. Rylance, Professors R. T. Ely, W. S. Clarke, E. J. James, and others, with constant editorials and leaders by Dr. Abbott, have formed almost an epoch in the development of Christian social thought in this country. Of this journal, the name of which has lately been changed to *The Outlook*, Dr. Abbott still remains editor-in-chief; and, in harmony with its rechristening, it is now giving greater attention than ever to social Christianity and the signs of the times. After Mr. Beecher's death (1887), Dr. Abbott was in due time chosen his successor in the pastorate of Plymouth Church, a position he still holds—a leader in progressive Christian thought. His recent lectures on *Evolution and Christianity* have elicited special interest.

ABOLITION MOVEMENT. Abolitionist is a term used in the United States specifically for those who favored and sought to effect the abolition of slavery. We here consider the subject simply in its relation to the United States. (For a general sketch of the history of the abolition of slavery through the world, see SLAVERY.) It should not be forgotten, however, that the abolition movement in the United States was but a part of this more general movement.

Christianity, as expressed by its followers, while not until modern times doing away with slavery, has always tended more or less, and at times very directly and effectively, to ameliorate the condition of the slave. The position of St. Paul in regard to Onesimus is well known. It seems probable that, outside of Palestine at least, Christianity was largely propagated among the slaves and despised classes that so abounded through the Roman Empire. When Christianity became dominant, while it still did not abolish, it did limit and check and endeavor to control. Council after council legislated on the subject. Very many Christians voluntarily freed their slaves. Church moneys and benefactions were used for the purchase of the freedom of slaves, notably by Gregory the Great. In England herself, slavery had disappeared by the fifteenth century. England's greatest sin in this respect seems to have been in the trading and carrying of slaves for others rather than in importing or capturing them for herself. The philosophy, too, of natural rights, and the social compact theory, which, beginning in England, found their most logical and their most fearful expression in France, asserted the inherent right of each individual to his own person, and the natural wrong, therefore, of slavery in any form.

It was these two tendencies, the one from

Christianity, the other from French, so called, naturalism and revolutionism, that contributed mainly to the abolitionist movement in America. Its first open expression, however, was among the Society of Friends or Quakers. As early as 1671 George Fox, in England, had spoken **Early Abolitionists.** against slavery, and in 1696 the Pennsylvania Quakers advised their members against the slave trade. In 1774 all persons engaged in the traffic, and in 1776 all who would not emancipate their slaves, were excluded from membership among the Friends. John Woolman (1720-73) and Anthony Benezet (1713-84) were prominent in this stage of the movement. In 1774 a Pennsylvania Society for the Abolition of Slavery was formed by James Pemberton and Dr. Benjamin Rush, and in 1787 was reconstructed under the presidency of Franklin.

The arguments of these earliest anti-slavery writers and workers were drawn mainly from general philosophic, humanitarian, and Christian principles. With Washington, Jefferson, Madison, Patrick Henry, and other Southerners, all of whom deplored and often spoke against, altho most of them practising slavery, other reasons entered in. While not insensible to the humanitarian arguments, they based their position largely on the above-mentioned French political principles then spreading through this country, and thus regarded slavery as a giant evil, inconsistent alike with the principles of the Declaration of Independence and the spirit of Christianity. Other abolition societies were organized in New York (1785), Rhode Island (1786), Maryland (1789), Connecticut (1790), Virginia (1791), New Jersey (1792). The abolition of the slave trade by Great Britain in 1807, and by the United States in 1808, was a great advance. In 1777 Vermont formed a constitution abolishing slavery, and was soon followed by Massachusetts and other States, while many others gradually abolished it.

In 1819-20 the opponents of slavery made a stern resistance to the admission of Missouri as a slave State, but were defeated. The struggle, however, resulted in the so-called Missouri Compromise (1820), whereby slavery was legalized to the south of 36° 30' N. Lat., and prohibited in all States that might be formed north of it (Mason's and Dixon's line). California, however, tho lying partly south of this line, was admitted as a free State (1850), the Southern party obtaining in compensation the amendment of the Fugitive Slave Law, making it penal to harbor runaway slaves or to aid in their escape. But this is to anticipate. From 1801-47 there were various efforts participated in by Jefferson, Henry Clay, James Madison, in the South, and Bishop Hopkins, Rufus King, President Harrison, and Dr. Channing in the North, to colonize the blacks in Africa. Liberia was declared independent in 1847. In 1831-32 the insurrection of Nat Turner in Virginia excited a strong desire for gradual abolition.

The first leader in *immediate* abolition was William Lloyd Garrison (see GARRISON), a Massachusetts printer, who (1829-30) worked with Lundy, in his *The Genius of Universal Emancipation*, published at Baltimore. In 1831 he be-

gan publishing *The Liberator* in Boston, and by 1832 the New England Anti-Slavery Society was formed. In 1833 Garrison visited England and secured from Wilber-

Immediate force, Zachary Macaulay, Henry Abolition. Brougham, and others, a condemnation of the colonization societies.

Garrison's principles were, in his own words—and they soon became the principles of all abolitionists, however they differed in method—that “the right to enjoy liberty is inalienable;” that “to invade it is to usurp the prerogative of Jehovah;” that “every man has a right to his own body, to the products of his labor, to the protection of law, and to the common advantages of society.” He said: “We plant ourselves upon the Declaration of our Independence and the truths of Divine revelation as upon the everlasting rock. We shall send forth agents to lift up everywhere the voice of remonstrance, of warning, of entreaty, and of rebuke. We shall circulate unsparingly and extensively anti-slavery tracts and periodicals. We shall enlist the pulpit and the press in the cause of the suffering and the dumb. We shall aim at a purification of the churches from all participation in the guilt of slavery. We shall spare no exertions nor means to bring the whole nation to speedy repentance.” Such were the principles, and such, at least in the earlier stages, were the methods of the abolitionists. Garrison was a firm believer in Christ. He proclaimed himself a follower of the Prince of Peace. Human life he came to regard as sacred above all things. Capital punishment and war, as well as slavery, were to him and to most abolitionists an abhorrence. Viewing the subject thus from the standpoint of morals rather than of any political expediency, slavery was to him a sin not to be gradually abolished, but to be left. In the *Liberator* (vol. i., No. 1, Saturday, January 1, 1831), he wrote: “I will be as harsh as truth and as uncompromising as justice. On this subject I do not wish to think or speak or write with moderation. No, no! Tell a man whose house is on fire to give a moderate alarm; tell him to moderately rescue his wife from the hands of the ravisher; tell the mother to gradually extricate her babe from the fire into which it has fallen, but urge me not to use moderation in a case like the present! I am in earnest; I will not equivocate; I will not excuse; I will not retreat a single inch; and I will be heard.”

From the beginning, Garrison had declared for no union with slaveholders, and proclaimed the Constitution “a covenant with death and an agreement with hell.” In December, 1833, the American Anti-Slavery Society was formed, with Beriah Green as president and Lewis Tappan and John G. Whittier, secretaries. Theodore D. Weld, Samuel J. May, and Wendell Phillips began lecturing. In 1833 Miss

Prudence Crandall, in Connecticut, opened her school to negro girls. She was ostracized, the Legislature forbade such schools, and she was imprisoned. Riots against abolitionists became frequent. Prices were reported to be set by the South on the heads of several of the leading abolitionists, ranging from \$3000 to \$20,000 each. The

latter sum was offered by six Mississippians for Garrison's head, and the same amount, made up publicly in New Orleans, was offered for the person of Arthur Tappan. In 1837 a slave was burnt to death over a slow fire in St. Louis; and for his words in denouncing this, Rev. Elijah P. Lovejoy, a Presbyterian minister who had established an abolitionist newspaper in Alton, Ill., was mobbed and killed. Garrison, in Boston, was seized by a mob, dragged by a rope half naked through the streets, and was only rescued by a *posse comitatus* and conveyed to the mayor's office. Abolitionist lecturers and sympathizers were denounced from the pulpit and subjected to every indignity. Judge Birney declared that “the American churches were the bulwarks of American slavery.” Such were some of the obstacles that abolitionist “apostles” had to contend with. Yet while the majority of pulpits either denounced the Garrisonian agitation or else were silent on the subject of slavery, there were ministers in all denominations who were outspoken in their denunciation of this great wrong, and valiantly espoused the cause of the slave. In the Unitarian denomination alone 170 ministers signed a protest against slavery, many of them preaching fearlessly against it, and willingly sacrificing favor and popularity in the cause of freedom.

As a not unnatural result of the popular prejudice and indifference, the Garrisonian wing now became very radical. They were accused of advocating every kind of innovation, from woman's rights to free love, and were freely denounced as “come-outers” and “infidels.” Birney, the Tappans, Gerrit Smith, Whittier, John Jay, Edward Beecher, Thomas Morris, and others left the original organization of the Garrisonians, and in 1840 organized the American and Foreign Anti-Slavery Society. They felt that the time was come for the organization of a new political party, while the Garrisonians continued to radically urge their doctrines through all parties. As a result, in 1840 the Liberty Party (*q.v.*) was organized, and in 1840 J. G. Birney was nominated for President, and F. J. Lemoyne, of Pennsylvania, Vice-President, polling 7059 votes. In 1844 Birney and Morris polled 62,300 votes. These were drawn mainly from voters for Clay. As a result, Polk was elected, Texas annexed, and a vast amount of slave soil added to the United States. The policy then began to prevail in the North of advocating limiting of the slave area, and this led to the formation of the Free-Soil Party. (See FREE-SOILERS.) In this the Liberty Party was mainly merged, though a few continued to vote a Liberty Party ticket to a much later date. In 1848 ex-President Van Buren was nominated as President by the Free-Soilers, and polled 291,363 votes.

Meanwhile, the agitation over the Fugitive Slave Law was coming to a head. The Constitution having recognized slavery by Art. 4, Sec. 2 of that document, it was declared that persons held to service or labor in one State under the laws thereof, and escaping to another, should be delivered up on claim of the party to whom such service or labor might be due. To this was added the amendment referred to above on

the admission of California as a free State. The demand was made by the Free-Soil Party that this be repealed; yet in 1852 they polled a diminished vote. The same year Harriet Beecher Stowe published her *Uncle Tom's Cabin*, which at once produced a remarkable effect in enlightening the people in general, and arousing in them a sense of the injustice and evil of slavery. In 1855 Captain John Brown went to Kansas to vote, and to fight as well, against the efforts of Missouri border ruffianism and squatter sovereignty to establish slavery in Kansas. The leading abolitionists were eagerly engaged in helping slaves to escape to Canada by means of the "underground railroad," or a series of houses whose inmates were willing to shelter and aid slaves in their secret flight to the North. In 1856 the Free-Soil Party was largely merged in the newly formed Republican Party, with General John C. Fremont as standard-bearer. (See REPUBLICAN PARTY.) He polled, however, only 114 electoral votes to 174 by James Buchanan, the Democratic candidate.

In 1856, May 19 and 20, Charles Sumner delivered his speech in the United States Senate on *The Crime against Kansas*. The speech was an exposure of the cruel injustice of the Government of the United States toward the free citizens of Kansas, and was strong and fearless both in its argument and its invective. Whitier said that "it was the severe and awful truth which the sharp agony of the national crisis demanded." It caused intense excitement among the pro-slavery members of the Senate. After the adjournment of the Senate, as Sumner sat writing at his desk, he was assaulted by Preston S. Brooks, of South Carolina. He was so severely injured that it was four years before he could again take his place in the Senate, which Massachusetts had left unfilled during his absence; and he suffered from the effects of the murderous assault as long as he lived.

In 1857 the validity of the Missouri Compromise was rejected by the Supreme Court in the Dred Scott decision. (See DRED SCOTT.) In 1859 John Brown made his effort to rouse the slaves at Harper's Ferry, was captured, and on December 2, hung.

In 1860 the success of the Republican Party led to the firing upon Fort Sumter (April 12, 13, 1861) and the opening of the war. The war at

first was not fought to abolish slavery, but simply to put down the rebellion. But the anti-slavery feeling grew. The fugitive slave laws were abolished in 1864. January 1, 1863, Lincoln issued, as a war measure, his emancipatory proclamation; and finally, in 1865, Congress passed the amendment to the Constitution abolishing slavery in the United States. On April 9, 1870, the American Anti-Slavery Society disbanded, believing its work fully done. (See NEGRO; SLAVERY; PHILLIPS; GARRISON, ETC.)

ABSENTEEISM, the practice of absenting one's self from one's country, station, estate, etc. In sociology it is used mainly of landlords absenting themselves from their lands and letting them out to tenants, the landlords giving no time nor care to their possessions except to receive the rents, which they spend in other places and communities. It has been an especial evil in Russia, France, and Ireland; but it is becoming common in the United States, where, through mortgage investments and foreclosures, many Western farms have fallen into the hands of companies or wealthy investors who have never seen the farms, but live on their rents, perhaps themselves residing in London or in Paris.

The evils of absenteeism are not hard to discover. There is, first, the loss of interest which a resident is apt to take in the things and persons about him. Thus he may be prompted to invest capital in local improvements, or to act as an employer of workmen. "It is not the simple amount of the rental being remitted to another country," says Arthur Young, "but the damp on all sorts of improvements."

The good feeling which is apt to grow up between a resident landlord and his tenantry has, again, material as well as moral results, which are generally beneficial. The absentee is less likely to take account of circumstances (*e.g.*, tenant's improvements), which render rack-renting unjust. He is less likely to make allowance for calamities which render punctual payment difficult. "Miseries of which he can see nothing, and probably hear as little of, can make no impression" (A. Young). He is glad to get rid of responsibility by dealing with a "middleman" or intermediate tenant. Without the softening influence of personal communication between the owner and the cultivator of the soil, the "cash nexus" is liable to be strained beyond the limit of patience. There can be little doubt but that absenteeism has been one potent cause of the misery and disturbances in Ireland. The same cause has produced like effects in cases widely different in other respects. The cruellest oppressors of the French peasantry before the Revolution were the *fermiers*, who purchased for an annual sum the right to collect the dues of absentee seigneurs; and this evil it is not hard to trace in American life. The proverbial hardness and harshness of the agent who collects rents for absent owners is not invariable, but is frequent. There is, too, the not-to-be-forgotten effect upon the absentee himself of collecting rents from strangers to whom he pays no duties. Sometimes it may be indeed for the good of a community that a rich and luxurious, and perhaps immoral, landlord be absent from it, but this brings us to another subject. (See LUXURY.)

Perhaps the safest generalization is that made by Senior, that "in general the presence of men of large fortune is morally detrimental, and that of men of moderate fortune morally beneficial, to their immediate neighborhood;" but at least where holdings are at all equally distributed, it is generally best both for the occupier and the owner that the latter should be not far away. It must be remembered, too, that to those who hold that land should be held only by those who

use it, or that all land should be taxed to its full rental value, absenteeism is an evil incident to the present system that is to be overcome only by the overthrow of the present system. To others it is an **Industrial Absenteeism**, evil to be overcome by the greater insistence upon the *duties* as well as the *rights* of wealth. A strong statement of a different but very real form of absenteeism we quote from the report of the Church League of Lowell, Mass., made October 9, 1893:

"It is largely true that the labor of Lowell earns the dividends, but they are mostly spent elsewhere, because the stock of the mill corporations is owned elsewhere. Thus we are confronted by the worst kind of absenteeism. The profits earned here go from here, while the mass of poverty, want, and vice that accumulates in every large manufacturing center is dumped on the charity of our churches and the hospitality of our poorhouse. We see the dreary dwellings of the earners of scanty wages; we see the premature age and disability of those broken down by the rapidly increasing speeding of machinery; we confront the intemperance and vice that follow from the hard conditions and hopeless despair of their bettering. The note-books of our ministers are filled with sad, sad cases of destitution, sickness, and death, made peculiarly sad by the life history of the mill operative."

Professor Hadley, in his *Railroad Transportation* (1886), p. 133, has some pertinent remarks on absentee shareholders.

ABSTINENCE, REWARD OF, an expression in political economy, first used by Senior (*q.v.*) to denote the profits which he considered to be the "natural" reward of the capitalist for the use of capital which he had abstained from using in immediate consumption. The phrase is called "well chosen" by Mill, and has been widely adopted, and undoubtedly contains some element of truth; but it is, nevertheless, considered to be inapt by most economists to-day, since it is at least in great danger of misleading. Thus, when Jevons says, in his *Political Economy Primer*, that "Capital is the result of saving or abstinence," he either expresses a mere truism, or states what is very frequently not the fact. If he means that capital is wealth that has not been consumed in other ways, he says what goes without saying; but if he means that capital is the result of saving and abstinence, so that the capitalist deserves to be rewarded because of his self-sacrifice, he implies what is very often *not* the case. All capital is by no means the result of careful saving and economy. It is notoriously very often the result of shrewd and fortunate investment by those who have lived at the same time in the utmost luxury and self-indulgence. It is made frequently by speculation and financiering in the "bulling" and "bearing" of stocks, in the engineering of some corner or combination in the market, in land speculation, and in a hundred other similar ways. Many fortunes have been begun as the result, perhaps, of saving and abstinence and economy at the very start, but after this, have been made by the bold, shrewd, and fortunate investment of the little sum. If the reliance had been *simply* on abstinence and economy, there would have been no fortune. G. Bernard Shaw, in the Fabian Essays, calls "reward of abstinence" that "gleam of humor which still enlivens treatises on capital."

ADAMS, FRANCIS, born in Malta, 1862; educated for the civil service. He became, however, a teacher and writer, issuing a volume of verse in 1884. He went the same year to Australia for his health, and threw himself into the labor movement, issuing his *Songs of the Army of the Night* in 1887. He returned to England in 1890 broken in health, yet continued to write for the cause of labor to the last in the *Fortnightly Review*, and issued *The New Egypt* just before a final hemorrhage. On September 4, 1893, he calmly and deliberately shot himself in the presence of his wife, and was buried "with clenched hands" in Margate Cemetery.

ADAMS, HENRY C., was born in 1852, in Davenport, Ia., and received his education at Iowa College, from which institution he graduated with the degree of A.B. in 1874. After teaching for awhile he studied at Johns Hopkins University, Baltimore, taking the degree of Ph.D. in 1878; he then went to Europe, where he stayed nearly two years. Returning to this country, he lectured on political economy and finance in Cornell University, Johns Hopkins University, and the University of Michigan, until finally, in 1887, he settled permanently at the University of Michigan. In that year he was elected statistician of the Interstate Commerce Commission, and from that time, in addition to the university work, has had charge of the railway statistics of the United States.

He would not be considered a member either of the historical or the *a priori* school of political economy, to the exclusion of the other. While denying that there is such a thing as a historical school which is to endure, or that it is logical to recognize the existence of an *a priori* school, he believes most thoroughly in a study of industrial history to prepare one for the consideration of economic doctrines. On the question of the tariff, Mr. Adams believes in free trade. He does not believe in the nationalization of natural monopolies, but in the control of them through commissions. He has always been an advocate of bimetallism, and may be considered to believe in this now (1895) from a theoretical point of view. As to what may be found in the present existing state of affairs in the United States he is not so clear.

Mr. Adams is the author of *Outlines of Lectures on Political Economy*; *Public Debts: An Essay on the Science of Finance*; and *The State in Relation to Industrial Action*, besides pamphlets and magazine articles.

ADDAMS, JANE. Daughter of the Hon. John H. Addams, State Senator of Northern

Illinois. Miss Addams graduated at Rockford Female Seminary in 1881. In 1889, with Miss Ellen G. Shaw, she founded Hull House, in Chicago, and has continued at its head to the present, developing it into its phenomenal and unequalled usefulness and success. (See HULL HOUSE.) Miss Addams is author of numerous magazine articles, among which are *The Subjective Necessity for Social Settlements* and *The Objective Value of a Social Settlement*. She has also contributed to the volume, *Hull House Maps and Papers*.

ADDERLEY, The Hon. and Rev. JAMES.

Born July 1, 1861, and educated at Oxford, he left popularity there to become the first head of Oxford House, in East London. During the great dock strike he aided the dockers, raising £800 for them. He wrote *Stephen Remarx* (1893), a Christian socialist novel, which has passed through many editions, and which outlines a church brotherhood of sacrifice and social effort, somewhat similar to one that "Father Adderley" has now formed in Plaistow (a working class suburb of London). Fr. Adderley is a leader in the London Christian Social Union, and editor of *Goodwill*, a Christian social monthly, adapted to parish use, with a present circulation of 24,000. He has also written *The New Floreat* and *Christ and Social Reform*, a tract for workmen. Address (1895), 128 Edgeware Road, London, W.

ADLER, FELIX, born August 13, 1851, in Germany, emigrated to the United States in 1857, and since that time has been a resident of New York. For a short time he attended the public schools, and was prepared for college in the Columbia Grammar School, whence he entered Columbia College in 1866, and was graduated in 1870. Afterward he spent three years at the University of Berlin, where he took the degree of Ph.D. in 1873. Returning to America in the fall of that year, Dr. Adler was appointed lecturer or non-resident professor at Cornell University in the spring of 1874. He founded the Society for Ethical Culture in New York on May 15, 1876, and has ever since been the leader and lecturer of that society. More or less similar societies have been founded in Chicago, Philadelphia, and St. Louis, in London, England, and Berlin, Frankfurt, Strassburg, and elsewhere in Germany. Dr. Adler is also the head of the Department of Ethics in the Plymouth School of Applied Ethics.

He has written a collection of lectures, published under the title of *Creed and Deed*, in 1877, by G. P. Putnam's Sons, and the *Moral Instruction of Children*, published in their International Educational Series by the Appletons; he has contributed to the *North American Review*, *Forum*, *Popular Science Monthly*, etc.

On the labor question he is of the opinion that the science of ethics, as such, has a distinct and important contribution to make toward the solution of this question, and agrees with Keynes, that a distinction is to be drawn between the ideal of economics, the science of economics, and the art of economics. He holds that it is the business of ethical science to supply the economic ideal, and disagrees with those who

expect to draw the economic ideal from the study of social science. It is the function of sociology to formulate the laws which have governed the development of society, but it cannot be expected to point out the direction which the development of society ought to take. Social science can tell us what has been and is; ethical science alone can tell us what ought to be.

Dr. Adler favors a low tariff, but is not a free-trader; he is in favor of more and more socializing, but not of nationalizing, the use of natural monopolies, and is opposed to all schemes looking toward an irredeemable currency.

ADLER, VIKTOR, a leading Austrian socialist, born in Prague, June 24, 1852. Educated a physician, he has given up his profession for socialist propaganda. In 1866 he started the *Gleichheit*, and succeeded in uniting the divided Austrian Socialist Party. He is now editor of the *Arbeiter Zeitung*, the organ of the Austrian Social Democratic Party; he is author of many socialist tracts and short books on labor chambers, universal suffrage, etc.

ADMINISTRATIVE NIHILISM, a phrase first used by Professor T. H. Huxley in an address before the members of the Midland Institute, 1871, to describe the doctrine (which he opposed) of those who believe that the State should be limited in its functions to the protection of its subjects from aggression. The address has since been published under this name of *Administrative Nihilism*. Professor Huxley quotes approvingly Locke's maxim, that "the end of government is the good of mankind," and defines the good of mankind as "the attainment by every man of all the happiness which he can enjoy without diminishing the happiness of his fellow-men." The question, then, of what the State should and should not do, he regards as to be decided, not *a priori*, but simply on the ground of whether it can be done better by the State or by private initiative—a conclusion to which to-day almost all sociologists adhere.

ADULTERATION OF FOOD, in political economy, means "the act of debasing a pure or genuine article for pecuniary profit by adding to it an inferior or spurious article, or taking one of its constituents away." In England, as early as the thirteenth century, the legislature attempted, though with but partial success, to strike a blow against it, showing that it existed even then; but it is modern invention and still more modern commercialism that has mainly produced it. Between 1851 and 1854 in England a sanitary commission, instituted in connection with *The Lancet* newspaper, and most ably conducted by Dr. Arthur Hill Hassall, made revelations of so startling a character that parliamentary action took place; and this, tho at first ineffective, has been improved, till it is now somewhat effective, and has been followed by legislation in other countries.

The most notable kinds of adulteration at present are the following: (1) The addition of a substance of inferior value, for the sake of adding to the bulk and weight of one more precious; as the mixing of water with milk, fat with butter, or chicory with coffee. (2) The addition of a substance with the view of heightening the color and improving the appearance of an

article, as well as to conceal other forms of adulteration; example, the coloring of pickles or preserves with salts of copper. (3) The addition of a substance designed to aid or increase the flavor or pungency of another; example, the addition to vinegar of sulphuric acid. (4) The addition of a substance designed to insure that a larger quantity of another one shall be consumed; example, beer, one of the chief adulterants of which at present is salt, put into the liquor to insure that when one employs it to slake his thirst, the more he drinks the more thirsty will he become. Some of the substances used for adulterating articles of food—the salts of copper and sulphuric acid, for instance—are poisonous; but Mr. Harkness, F.C.S., of the Laboratory, Somerset House, who has had much experience in analyzing specimens sent thither on appeal, considers that at present adulteration does not prevail as extensively as the public believe, and that, as a rule, the purchaser of a debased article is more likely to suffer in purse than in health.

AGAPE, a love feast, or feast of brotherhood and social communion, in the early Christian Church. The name comes from the Greek word *ἀγάπη*, signifying love. At these feasts the rich Christians presented their poorer brethren with gifts, and all sat around the tables and ate together as a token of their equality before God. The utmost harmony and fellowship prevailed. Prayer opened and closed the meeting, and a bishop or presbyter presided. A portion of Scripture was read, expounded, and discussed; and during the feast spiritual songs were sung. If any communication had been received from another church, or from an absent member or bishop, it was publicly read. Money was collected for widows, orphans, prisoners, the poor, and those who had suffered shipwreck. At the close the members embraced, and a "philanthropic prayer" was pronounced. A spirit of practical sympathy and benevolence prevailed. The participants did not seek for private spiritualities nor for personal enjoyment, but acted as "members one of another." In the second century persecutions checked the agape, and in the third and fourth centuries they degenerated into a kind of banquet, where the deaths of relatives and martyrs were commemorated, and where the clergy and the poor were guests. The increase of wealth at last rendered their original purpose abortive, and transformed them into positive evils, and too often scenes of iniquity. Councils denounced them for their riotousness and debauchery, and finally banished them altogether.

The agape have been revived by the Moravians, who hold solemn feasts where wheat bread and tea are set before the participants, and where prayer and praise are offered up.

See GUILDS. SEC. I., ANCIENT LABOR GUILDS.

AGE OF CONSENT. Age of consent laws, in their usual acceptation, refer to the crime of rape, and designate the age at which a young girl may legally consent to carnal relations with the other sex. Statutes pertaining to rape provide, in varying phrase, for the punishment of "whoever ravishes and carnally knows a female by force and against her will," at any age; and also penalties for whoever unlawfully and carnally knows a female child, with or without consent, under a given age. That age varies in different States in the United States and in different countries. Under the old English common law, the age was 10, sometimes 12 years. Until within the last decade the old Common

Law period of 10, sometimes 12 years was the basis of the age of consent legislation of most of the States, and also of the law of Congress pertaining to rape in the District of Columbia and other territory under the immediate jurisdiction of the National Government. It still continues the basis of the age of consent laws of North Carolina, South Carolina, Georgia, and Alabama, wherein the age remains at 10 years, and in Texas, Kentucky, Wisconsin, and Louisiana, wherein the age is 12 years.

It was not until after the astounding revelations made by Mr. Stead, in 1885, of the crimes against young girls in London that the age of consent laws in the United States began to attract attention, except in courts of law, on this side of the Atlantic. Even then the age of consent in England was 13 years. One outcome of Mr. Stead's shocking exposures was the speedy raising of the age by the British Parliament from 13 to 16 years, Mr. Gladstone and others advocating 18. The New York Committee for the Prevention of State Regulation of Vice has been at work for 10 years to thwart the periodical efforts made to introduce in New York and other American cities the odious old world system of licensed and State-regulated vice; but its members were quite unaware, until Mr. Stead's startling London revelations suggested the inquiry here, that, by the age of consent laws of New York and of most of the States, young girls of 10 years were made legally capable of consenting to their own ruin, and that at that time in one State (Delaware) the age was at the shockingly low period of 7 years! Bad as English law had been shown to be in its inadequate protection of girlhood, our own legal position in relation to exposed young girls was found to be still worse. The New York Committee, as soon as the facts were known, inaugurated a campaign of petitions to sundry State legislatures and to the Congress of the United States, asking that the age be raised to at least 18 years, and the work was also entered into earnestly and effectively by the Woman's Christian Temperance Unions and the White Cross societies. Changes in the age of consent laws soon followed in many States.

In New Hampshire and Utah the age is now (June, 1895) 13 years, the same as in England before Mr. Stead's investigation. In 19 States the age is now 14 years—viz., Maine, Vermont, Connecticut, Michigan, Indiana, Missouri, Idaho, New Mexico, Arizona, North Dakota, Maryland, West Virginia, Ohio, Illinois, Iowa, Minnesota, Nevada, California, and Oregon. In Montana the age is 15 years. In 6 States the age is 16 years—viz., Massachusetts, Rhode Island, New Jersey, Pennsylvania, Washington, South Dakota, Arkansas; and also in the District of Columbia. In Tennessee the age is 16 years and one day, the one day having been added as a facetious amendment while the matter was under consideration in the Tennessee Legislature. In Florida the age is 17 years. In four States—Wyoming, New York, Colorado and Kansas—the age is 18 years. In Delaware "an act for the better protection of female children," passed March 29, 1889, fixed the age at 15 years, now raised to 18 years. In Texas, in 1890, the age was reported by the Secretary of State as

12 years ; in Louisiana, 12 years ; and in Mississippi, 16 years. Official answers to our last inquiries from these four States have not yet come to hand.

Several attempts have been made in different States to lower the age of consent again after it had been raised. Thus far, fortunately, they have not been successful. In the New York Senate, in 1890, a bill was introduced to lower the age of consent from 16 to 14 years. It was reported favorably by the Senate judiciary committee, but vigorous protests against the proposed retrograde legislation were promptly sent to Albany by the friends of purity, and the disreputable scheme was defeated. It was understood to have originated with Rochester attorneys, who sought thus to provide a way of escape for a client, a well-to-do debauchee guilty of despoiling a young girl under the legally protected age of 16. Another attempt was made in the New York Legislature, in 1892, this time in the Assembly, to lower the age of consent from 16 to 14 years. A motion made to amend thus the penal code was adopted by a *vive voce* vote, and was about to be declared carried, when the chairman of the judiciary committee, realizing its serious import, called for the yeas and nays, declaring that on such a measure the constituents of every member should know how his vote was cast, and that all should therefore go on record. This effectually killed the unworthy amendment, proposed, it was understood, in the interest of the brothel-keepers of New York. In the Kansas Senate, in 1889, a bill was introduced and passed to lower the age of consent in that State from 18 to 12 years. The house was flooded with earnest protests, and its judiciary committee reported adversely the disgraceful Senate bill.

According to the New York law, unless it can be shown in court that the girl resists to the uttermost limit of exhaustion the man who assaults her, the man can successfully plead her "consent."

In noting the changes of the last decade in the age of consent laws of this country, it is a suggestive fact that the two States in which the age of legal protection for girlhood was first raised to 18 years are States in which women vote—in Wyoming, upon equal terms with men, and in Kansas, in municipal elections, while they have been followed by Colorado, another State that has enfranchised women.

Under French and other continental common law the minor under the age of 21 cannot legally consent to her own corruption, and the adult who debauches her cannot plead "consent" in defence, and is subject to punishment.

AARON M. POWELL.

Says Emily Blackwell, M.D., in the *Arena*, January, 1893 ;

"By fixing the age of legal majority the State declares that under this age young people have not the experience nor the maturity of judgment which would qualify them for independent action in matters of importance affecting their own interests. They are in consequence made incapable of such action. Their consent cannot relieve a guardian from responsibility in the management of their property. Except in a few exceptional cases they cannot make a contract which

will be binding when they come of age. A minor cannot legally marry without the consent of the guardian. Surreptitious marriage with a minor is an offence punishable by law, and such a marriage can be annulled upon the application of the guardian. Thus their power of action is, in their own interest, so limited that their consent is not sufficient to make valid even perfectly legitimate transactions, nor does it avail to protect adults who assume it as sufficient authority.

"Even in crime youth is allowed as an extenuating circumstance, from the general feeling that the young are less able to resist external influences, and are less responsible for their actions than the adult. The establishment of reformatories for juvenile offenders testifies to the belief that their characters are still unformed for good or for evil.

"In the case of girls, the State has not only extended exceptional protection to them as minors in reference to their legitimate social relations, it has also established a sort of legal majority in reference to those that are illegitimate. It has fixed an age below which girls are held to be incompetent of assent to such illegitimate relations. 'Consent,' as it is termed, varied in all the different States, until recently, from the age of 7 to 12 years, and in many of them it is still only 10 or 12. This arrangement amounted virtually to the protection of children only of the years during which the physical abuse of children is so brutal an offence as to excite indignation even among the majority of persons of vicious life. The protection accorded in other respects to minors was distinctly and emphatically withdrawn from girls during the first few years of early womanhood, when it is most needed.

"Such legislation is directly in the interest of vice. The line is drawn just where those who are interested in vice would have it. It is certainly as illogical as cruel that at an age when a girl's consent is not held sufficient for legal marriage, it should be held sufficient to justify her destruction. A man may not legally marry the minor daughter of another without his consent, but he is legally free to seduce her if he can. . . .

"Wherever the age of protection has been raised the result has been for good only. It acts as a deterrent upon those who would mislead youth. It strengthens the hands of the individuals and societies who work for the protection and help of friendless youth. It would seem sufficient to state the case fairly to accomplish the end, but the great, long-continued effort that has been needed to partially accomplish this end testifies to the contrary."

The following is the present age of consent in the different States :

State	for males, 18 years ;	for females, 14 years.
Arizona,	17	16
Arkansas,	17	14
California,	15	14
Colorado,	14	18
Connecticut,	14	14
Delaware,	15	18
Dist. Columbia,	14	16
Florida,	14	17
Georgia,	17	10

them to refer not to private, but only to public lands. They referred to the lands acquired by military conquest.

"It was the practice at Rome," says Dr. Arnold, "and doubtless in other States of Italy, to allow individuals to occupy such lands, and to enjoy all the benefits of them, on condition of paying to the State the tithe of the produce, as an acknowledgment that the State was the proprietor of the land, and the individual merely the occupier. Now, although the land was undoubtedly the property of the State, and although the occupiers of it were in relation to the State mere tenants-at-will, yet it is in human nature that a long undisturbed possession should give a feeling of ownership; the more so as, while the State's claim lay dormant, the possessor was, in fact, proprietor, and the land would thus be repeatedly passing by regular sale from one occupier to another."

The very idea of a citizen in ancient times conveyed the idea of a land-owner, and as new citizens were admitted to all Roman privileges, they received an allotment of land from the public domains. This necessitated an interference by the State with those who temporarily occupied the land; and as these occupiers were generally Roman aristocrats, the interference was resisted. It was to the interest of the aristocrats to keep the lands public property, and therefore they opposed all agrarian legislation. Their opposition to this distribution of land, together with economic tendencies that favored the wealthy, resulted in producing a large proportion of landless citizens; and the endeavor by some of the noblest Roman statesmen to provide these dispossessed citizens with the land that rightfully belonged to them, occasioned some of the most notable struggles in Roman history. One of the first consuls to propose an agrarian law was Spurius Cassius, who, at a time of great poverty among the Roman workingmen, desired to have the public lands divided among them. The aristocracy defeated him, and finally secured his death for daring to propose an infringement upon their privileges.

The first important agrarian legislation of a permanent nature actually passed was that proposed by the tribune Licinius Stolo, and carried, after a struggle of five years, in the year of Rome 383. The provisions of Licinius's bill, or *rogation*, were as follows: "Every Roman citizen shall be entitled to occupy any portion of the unallotted state land not exceeding 500 jugera, and to feed on the public pasture-land any number of cattle not exceeding 100 head of large, or 500 head of small, paying in both cases the usual rates to the public treasury. Whatever portions of the public land beyond 500 jugera are at present occupied by individuals shall be taken from them, and distributed among the poorer citizens as absolute property, at the rate of 7 jugera apiece. Occupiers of public land shall also be bound to employ a certain number of freemen as laborers."

For a time this law was enforced with very good effect. Poverty and inequality decreased. But by the year 621 the law was neglected; and although large tracts of land had been acquired, there were large numbers of landless citizens in Rome. Wealthy capitalists secured the public lands and had them tilled by hired labor for profit. For 100 years there was no distribution of land. The pauper population of the city increased at one end, and the wealth and pride and luxury of the aristocracy increased at the other. A few

It should be remembered, however, that these ages are continually being changed by legislation.

Reference: For the latest information, see *The Philanthropist*, published monthly for the promotion of social purity, the better protection of the young, the repression of vice, and the prevention of its regulation by the State. Editors, Aaron M. Powell and Mrs. Anna Rice Powell, United Charities Building, New York.

AGIO (It. *agio*, exchange). A commercial term, used principally in Europe, to denote (1) the rate of exchange between the currencies of two countries. (2) The percentage of difference in the value of (a) two metallic currencies, or (b) a metallic and a paper currency of the same denomination and in the same country, hence premium on the appreciated currency. (3) An allowance made in some places for the wear and tear of coin. Adam Smith uses the word sometimes in the first and sometimes in the second sense, saying, for example, that the *agio* of the Bank of Amsterdam over the currency of Amsterdam was generally about 5 per cent.

AGRARIAN LEGISLATION. All laws or measures tending toward the abolition or limitation of private property in land are often termed agrarian legislation, in reference to the famous agrarian laws of Rome, which were till recently supposed to have operated strongly in this direction, and to some extent probably did so. This conception of agrarian legislation was common even among scholars as late as the beginning of this century. In 1793 the French convention introduced legislation to punish with death any one who should propose an agrarian law, by which they meant equal division of the soil among the citizens. The German scholars Heyne, Niebuhr, and Savigny first declared the true purpose of these Roman laws, discovering

nobles began to practically own the greater part of the land, while most of the citizens were in want. Long occupation of public lands had confused public with private property, and given the capitalists and nobles a kind of proprietary claim to the land they occupied; so that, while there was no doubt as to the wisdom and justice of a division of public land, there were many obstacles in the way. It was Tiberius Gracchus who at last had the boldness to propose an agrarian law. He proposed that every father of a family might occupy 500 jugera of the State land for himself, and 250 jugera additional for each of his sons; but that, in every case where this amount was exceeded, the State should resume the surplus, paying the tenant a price for the buildings, etc., which he had been at the expense of erecting on the lands thus lost to him. The recovered lands were then to be distributed among the poor citizens, a clause being inserted in the bill to prevent these citizens from selling the lands thus allotted to them, as many of them would have been apt to do.

His proposition was strictly in accord with the laws and spirit of the Roman constitution; but it was nevertheless furiously opposed by the wealthy classes, who went as far in their lawless opposition as to assassinate Gracchus and his brother in cold blood. His measure was, however, carried into effect; but its enforcement was so greatly hindered and evaded as to render it of little value to the suffering people. The aristocrats passed other laws directly opposite to that of Gracchus, and securing them in their usurpations. C.

AGRICULTURAL COLLEGES AND EXPERIMENT STATIONS.

The first agricultural school was founded by Fellenberg at Hofwyl, Switzerland, in 1806, and endured 30 years, educating 3000 pupils. The Albert Institution, a great agricultural college, was founded at Glasnevin, near Dublin, Ireland, in 1838. A private experimental station was started at Rotham, England, in 1843. The Royal College of Agriculture at Cirencester, England, was commenced in 1845, and a college of agriculture at Downton in 1880. The English government gives small grants to chairs of agriculture at South Kensington, the University of Edinburgh, and a few other less important institutions. In Prussia almost every province has its State-supported school of agriculture. In France the Government gives large grants for agricultural education. The school at Gregnon occupies an old palace and possesses 1185 acres.

In the United States, the first agricultural college was established at Cleveland, O., in 1855.

Under the provisions of the acts of Congress of July 2, 1862, and August 30, 1890, colleges having courses in agriculture are in operation in all the States and Territories. In 14 States separate institutions are maintained for white and colored students. The total number of institutions having courses in agriculture in the United States is 65. The organization of these institutions is so varied that an exact classification of them is impracticable. In a general way, however, they may be classified as follows: (1) Universities having colleges or departments of agriculture; (2) colleges of agriculture and me-

chanic arts; (3) colleges of agriculture; (4) secondary schools of agriculture. In these institutions the college course in agriculture leading to a degree covers four or, in some cases, three years. Shorter courses of one or two years, or of a few months, are also provided in many institutions. Special courses in dairying and in other agricultural industries have been recently established at a few of the colleges.

The total number of officers in the faculties in 1893 was 1282. The total number of students was 17,623, of whom 3160 were in the courses in agriculture. The graduates from the courses in agriculture in 1893 numbered 265, and the total number of graduates in those courses since the establishment of the colleges is 3016.

The total revenue in 1893 was \$4,024,132, from the following sources: United States (including income of land grant of 1862 and appropriation under act of Congress of 1890), \$1,463,215; State, \$1,093,870; local communities, \$10,003; individuals, \$60,906; fees, \$301,141; farm produce, \$116,625; miscellaneous, \$953,372. The value of additions to equipment in 1893 is estimated as follows: Farm implements, \$26,559; buildings, \$1,035,589; library, \$84,638; apparatus, \$151,900; live stock, \$16,276; miscellaneous, \$66,675; total, \$1,451,637.

The Wisconsin dairy school, the first of its kind in America, grew out of the belief that it might be of direct and great help to dairy interests. A study of the dairy instruction imparted in Denmark showed that the system there adopted was not suitable for Wisconsin. These students are given the theory of dairying at the school and the practice by placing them one or two in a factory, where they serve an apprenticeship. While many of the factories in Wisconsin were excellently managed, it was felt that the student should have actual practice while studying in the manufacture of butter and cheese under skilled instructors. The result was the Hiram Smith Hall, named in honor of Regent Hiram Smith, of the State University, who had worked faithfully in the upbuilding of Wisconsin's dairy interests, and especially for this school.

Agricultural experiment stations are now in operation under the act of Congress of March 2, 1887, in all the States and Territories. Alaska is the only section of the United States which has no **Agricultural Stations**. In each of the States of Alabama, Connecticut, Massachusetts, New Jersey, and New York a separate station is maintained wholly or in part by State funds, and in Louisiana a station for sugar experiments is maintained mainly by funds contributed by sugar planters. In several States sub-stations have been established. Excluding the branch stations, the total number of stations in the United States is 55. Of these 49 receive the appropriation provided for in the act of Congress above mentioned. The total income of the stations during 1893 was \$950,073, of which \$705,000 was received from the National Government, the remainder coming from State governments, private individuals, fees for analyses of fertilizers, sales of farm products, and other sources. In addition to this the Office of Experiment Sta-

tions has an appropriation of \$25,000 for the current fiscal year. The value of additions to equipment in 1893 is estimated as follows: Farm implements, \$8330; buildings, \$59,578; libraries, \$11,216; apparatus, \$17,672; live stock, \$7085; miscellaneous, \$29,927; total, \$133,858.

The stations employ 532 persons in the work of administration and inquiry. The number of officers engaged in the different lines of work is as follows: Directors, 70; chemists, 119; agriculturists, 54; horticulturists, 62; farm foremen, 25; dairymen, 7; botanists, 37; entomologists, 42; veterinarians, 26; meteorologists, 13; biologists, 11; physicists, 4; geologists, 4; mycologists and bacteriologists, 5; irrigation engineers, 4; in charge of sub-stations, 33; secretaries and treasurers, 25; librarians, 8, and clerks, 27.

For further details see report of the Secretary of Agriculture for 1893, from which the above has been in the main abridged.

AGRICULTURALISTS. See **PHYSICRATS.**

AGRICULTURE. (See also **LAND**; **FARMERS' MOVEMENT**; **COOPERATION**; **ABANDONED FARMS**; **GRANGE**, ETC.) We here consider:

1. The history of agriculture.
2. The statistics of agriculture.
3. The economics of agriculture.

I. History.

(a) IN ANCIENT TIMES.

The history of agriculture reaches back to the earliest times. On Egyptian hieroglyphs, Assyrian rolls, in Bible records, we have glimpses of its earliest history. It was agriculture that first produced civilization, since it first gave to man an abiding home. (See **LAND**.) Asia was probably its birthplace.

To-day in Central Asia the tribes of pastoral nomads are made up of groups, each under the authority of the head of a family, and nothing is the subject of separate ownership except clothes and weapons (Le Play, *Ouvriers Européens*). When a group becomes too large a division is made by the head in a manner suggestive of the division made between Abraham and Lot.

It was probably thus that land was first held, tilled by little groups of men, gathered for defence around or enslaved by some strong head of the family or group. We are probably, however, not to think of these as little communistic groups, as suggested by De Laveleye (*Primitive Property*). It is more probable, as suggested by later writers (see **LAND**) that while the land was in one sense held in common, it was rather held by one strong man in despotism over the rest, whom he made to toil for him under conditions little removed from the lowest slavery. The implements of agriculture were of the rudest description—such as those used in Turkey even to-day—a crooked stick or curved beam serving for a plough, and other implements of proportional simplicity. Nevertheless, in Egypt, for example, considerable progress was made. Diodorus Siculus bears explicit testimony to the skill of the farmers of ancient Egypt. He informs us that they were acquainted with the benefits of a rotation

Egypt.

of crops, and were skillful in adapting these to the soil and to the seasons. The ordinary annual supply of corn furnished to Rome has been estimated at 20,000,000 bushels. From the same author we also learn that they fed their cattle with hay during the annual inundation, and at other times tethered them in the meadows to feed on clover. Their flocks were shorn twice annually (a practice common in several Asiatic countries), and their ewes yeaned twice a year. For religious as well as economical reasons, they were great

rearers of poultry, and practised artificial hatching, as at the present day. Wilkinson's *Egypt*, giving many of the pictures and inscriptions from the tombs, etc., discloses a state of advancement which we little realize: "An Egyptian villa comprised all the conveniences of a European one of the present day. Besides a mansion with numerous apartments, there were gardens, orchards, fish-ponds, and preserves for game. Attached to it was a farmyard, with sheds for cattle and stables for carriage horses. A steward directed the tillage operations, superintended the labourers, and kept account of the produce and expenditure. The grain was stored in vaulted chambers, furnished with an opening at the top, reached by steps, into which it was emptied from sacks, and with an aperture below for removing it when required. Hand-querns, similar to our own, were used for grinding corn; but they had also a larger kind worked by oxen. In one painting, in which the sowing of the grain is represented, a plough drawn by a pair of oxen goes first; next comes the sower scattering the seed from a basket; he is followed by another plough; while a roller, drawn by two horses yoked abreast, completes the operation. The steward stands by superintending the whole."

The prominence given to agriculture among the Jews is well proven. Says Schaff's *Bible Dictionary*: "Agriculture was recognized and regulated by the Mosaic law as the chief national occupation. Inalienable ownership—under God—of the soil was a fundamental provision, and renting the ground till the year of jubilee was alone possible. 'The land shall not be sold for ever: for the land is mine; for ye are strangers and sojourners with me' (Lev. 25:8-16, 23-35). The encouragement such a provision gave to agricultural improvements cannot be exaggerated.

Palestine.

"That the land must rest one year in seven was another remarkable and most beneficent requirement (Lev. 25:1-7). The Jews were forbidden to sow a field with divers seeds (Deut. 22:9). For example, wheat and lentils must not be mixed, nor areas of them meet. The rabbis describe with minuteness how to vary the position of crops, yet avoid actual contact between them, and prescribe at least three furrows' margin between such divers kinds. The yoking together of an ox and ass was prohibited, but is common enough among the present inhabitants. Horses were never used for farm-work.

"Vineyards are enclosed in walls, and gardens are usually protected in the same way, or by banks of mud taken from ditches. Otherwise, in agricultural districts the absence of all fences or enclosures is and always was in striking contrast to our own practice. A brook or cliff may serve as a boundary, but ordinarily large stones almost covered by the soil are the landmarks (Deut. 19:14). Exceedingly beautiful to the eye are the vast fertile areas of Palestine, checked only by cultivation. As cattle find pasture through most of the year, there are no proper barns to be seen. Grass is cut in watered places with a sickle for 'soiling,' and stock is fed with this or with grain when the fields are dried up. More commonly, during periods of scarcity, the flocks and herds are driven to other feeding-grounds. Booths are sometimes provided for inclement weather, and at night cattle are driven into caves or folds.

"The permission to pluck and eat a neighbor's grapes or grain, but not to put the former in a vessel nor use a sickle on the latter, is not to be forgotten (Deut. 23:24, 25). There was also merciful provision that the poor might glean in the vineyard and harvest-field, and that something should be left for them (Lev. 19:9, 10; Deut. 24:19).

"... Oriental ploughing does not turn a sod, but merely scratches the earth to the depth of 3 or 4 inches at most, which is all the primitive and light plough and the small cattle of the East can do. Often—always in the case of new ground—a second ploughing crosswise was practised; and this is referred to by the word 'break' in Isa. 28:24. Steep hill-sides were prepared for planting with the mattock or hoe, an iron-pointed instrument of wood resembling in shape the modern 'pick' (Isa. 7:25). Good farmers ploughed before the rains, that the moisture might be more abundantly absorbed. The seed, being scattered broadcast upon the soil, was ordinarily ploughed in, as is still the custom. Light harrowing, often with thorn bushes, completed the process. In wet ground the seed was trampled in by cattle (Isa. 32:20). After its planting there was commonly little further labor bestowed upon the crop till it was ready for the harvest. Weeds were removed by hand when it was safe to do so (Matt. 13:28, 29). Irrigation was sometimes necessary,

As the ingathering drew near, the fields must be protected by the watchman in his lodge from the wild boar and other beasts, and from human marauders. The newly scattered seed and the ripening crop also required to be defended against great flocks of birds (Matt. 13: 4).

"Grain when ripe was in more ancient times plucked up by the roots. Later, it was reaped by a sickle resembling our own, either the ears alone being cut off or the whole stalk. Laborers, animals, or carts bore the harvest to the threshing floor, where the grain was separated from the ears and winnowed."

Of Grecian agriculture little is known. The Greece that we know is the Greece of conquerors, who lived on the labors of slaves in mines, in fields, and in industries. The cultivation of the soil was despised, and has made little impress upon Greek literature. With the Romans it was different. Says Schlegel (*Philosophy of History*, p. 253): "It was in land and in the produce of the soil that their principal and almost only wealth consisted. They were a thoroughly agricultural people, and it was only at a later period that commerce, trades, and arts were introduced among them, and even then was separated by a subordinate place."

The Roman Empire.

They occupied but a subordinate place." Their passion for agriculture survived very long; and when at length their boundless conquests introduced an unheard-of luxury and corruption of morals, the noblest minds amongst them were strongly attracted towards the ancient virtue of the purer and simpler agricultural times. Cicero puts into the mouth of Cato a fine picture of the ancient Roman enthusiasm in agriculture: "I come now to the pleasures of husbandry, in which I vastly delight. They are not interrupted by old age, and they seem to me to be pursuits in which a wise man's life should be spent. The earth does not rebel against authority; it never gives back but with usury what it receives. The gains of husbandry are not what exclusively commend it. I am charmed with the nature and productive virtues of the soil. Can those old men be called unhappy who delight in the cultivation of the soil? In my opinion there can be no happier life, not only because the tillage of the earth is salutary to all, but from the pleasure it yields. The whole establishment of a good and assiduous husbandman is stored with wealth; it abounds in pigs, in kids, in lambs, in poultry, in milk, in cheese, in honey. Nothing can be more profitable, nothing more beautiful than a well-cultivated farm."

Mr. Hoskyn, in his *History of Agriculture*, quotes the following interesting passage from Pliny, commenting on Virgil: "Cato would have this point especially to be considered, that the soil of a farm be good and fertile also, that near it there be plenty of labourers, and that it be not far from a large town; moreover, that it have sufficient means for transporting its produce, either by water or land. Also, that *the house be well built*, and the land about it as well managed. But I observe a great error and self-deception which many men commit, who hold opinion that the negligence and ill-husbandry of the former owner is good for his successor or after purchaser. Now, I say, there is nothing more dangerous and disadvantageous to the buyer than land so left waste and out of heart; and therefore Cato counsels well to purchase land of one who has managed it well, and not rashly and hand-over-head to despise and make light of the skill and knowledge of another. He says, too, that as well land as men, which are of great charge and expense, how gainful soever they may seem to be, yield little profit in the end, when all reckonings are made. The same Cato being asked what was the most assured profit rising out of land, made this answer: 'To feed stock well.' Being asked again what was the next, he answered: 'To feed *with moderation*.' By which answer he would seem to conclude that the most certain and sure revenue was a *low cost of production*. To the same point is to be referred another speech of his, 'that a good husbandman ought to be a seller rather than a buyer'; also, 'that a man should stock his ground early and well, but take long time and leisure before he be a builder'; for it is the best thing in the world, according to the proverb, 'to make use and derive profit from other men's follies.' Still when there is a good and convenient house on the farm, the master will be the closer occupier, and take the more pleasure in it; and truly it is a good saying that 'the master's eye is better than his heel.'"

In the later days of the empire the land was tilled only by slave labour, under landlords of gigantic wealth, who cared nothing for agriculture. Corruption set in, leading to the famous dictum of Pliny that it was the *latifundia* which overthrew Rome. The evil was fur-

ther aggravated by the policy that the Romans pursued towards the inhabitants of the conquered provinces; there none of the land was held as freehold, but it was solely vested in the Roman people, being all let out for the benefit of the State. On the conquest of Sicily the wealthy Romans flocked over and farmed the rents, as well as cultivated the lands by means of slave-labour. Indeed, the chief supplies of grain sent to Rome from Sicily, Sardinia, and Carthage were raised by means of slaves.

(b) THE MIDDLE AGES.

Agriculture in the middle ages was largely modified by the system of feudalism (*q.v.*). (See also MIDDLE AGES.) Under the incursions of the Goths, Vandals, and other tribes, it sank into the lowest condition. The rural condition of Europe in the tenth century was pitiable in the extreme. Universal rapine and violence made it unsafe to till open land, and unprofitable to undertake improvements. The impression that the year 1000 would see the end of the world, which was widespread, caused the fields to be still more deserted, industry still more abandoned. After the year 1000 there was some revival of industry. The monasteries (see MONASTICISM), cultivating little tracts of ground, worked by the monks with their own hands, did much to spread the knowledge and practice of agriculture.

In Spain the Saracens did more. By them and their successors, the Moors, agriculture was carried in Spain to a height which perhaps has not yet been surpassed in Europe. It is said that so early as the tenth century the revenue of Saracenic Spain alone amounted to £6,000,000 sterling—probably as much as that of all the rest of Europe at that time. The ruins of their noble works for the irrigation of the soil still attest their skill and industry, and put to shame the ignorance and indolence of their successors.

In England agriculture seems to have been a little more prosperous than on the continent. Says Palgrave's *Dictionary of Political Economy*: "Among the early Saxons the soil had been tilled by village communities. The land held by the association was divided into two main divisions: (1) round the homesteads lay permanent inclosures held as private property (cp. Tacitus, *suum quisque domum spatium circumdat*); (2) beyond the village lay the common lands of the association. This latter portion consisted of (a) arable fields, sometimes two generally three, and in later times four, in number; (b) meadowland for hay; (c) rough wild pasture for live stock. Of the three arable fields, one was cultivated each year for wheat or rye, another for oats, barley, peas, and beans, and the third lay fallow. Thus each field every third year was fallow. Both the meadow and arable lands were cut into strips and annually allotted to the use of individuals from putting up for hay or from seed-time. Each partner held scattered intermixed parcels in each of the arable fields, so as to equalize the quality of the land, and to give each a share in the different crops cultivated. The farming was regulated by a system of 'field-constraint,' or later by the reeve of the manorial lord. After the crops were cleared, separate use terminated and common rights recommenced, the cattle and sheep of the community wandering over the fields before the common herdsman or shepherd (for a detailed account of the system, see Seebohm's *The English Village Community*). Co-tillage remained a feature of English farming after the Norman Conquest. Up to the close of the eighteenth century half the soil of England was thus cultivated, and in 1879, 600 acres at Stogoursey, near Bridgewater, were farmed on this system. By the close of the eleventh century the immediate lordship of the soil was vested in lords of manors, subject to regulated rights of user enjoyed by the co-operative farmers. The manorial estate was divided into three parts—the demesne, the tenemental land of the associated farmers, and the lord's wastes, over which the live stock of the tenants grazed. The soil was tilled by serfs, by freemen, and by semi-serville tenants, who paid for their land by military or agricultural services. Out of these grades in the rural population sprang the freeholder, the copyholder, and the

England.

free wage-earning labourer. The most striking features in mediæval farming were the violent alternations from perpetual cropping to barrenness, from indolence to intense labour, from famine to feasting. Scarcely anything was grown for markets; nearly all the produce was consumed at home by the producers. Arable land exceeded grassland. No manure was employed; horses were scarcely ever used; oxen were more economical; their food, harness, and shoes were cheaper; when dead they were meat for man. The crops were wheat, oats, barley, rye, beans, peas, flax, and hemp."

Thorold Rogers (*q.v.*) gives in his *Work and Wages* a picture of rural mediæval England. We give it here in abridged form. He says:

"The first information which we get as to the occupations of the people in rural districts discloses to us the fact that almost every one not only possessed land, but that he cultivated it. The king was not only the largest landowner in the realm, but the most extensive agriculturist, the wealthiest owner of live and dead stock" (p. 47).

"In the thirteenth century there was no rent paid, in the ordinary economical sense of the word. There was no competition for holdings in that state of society in which the great landowner cultivated his property with his own capital, and the smaller tenants had a genuine fixity of tenure under traditional, customary, and certain payments. There were occasions, it is true, in which from an early period lands were let to farm. But these tenancies, to which allusion has been made above, were land and stock leases, on really beneficial terms to the tenant; for the estimated value of the stock, or its compensation, in case the tenant failed to restore it at the termination of his lease, was from 30 to 40 per cent. below the market value, unless, as is highly improbable, the stock on such land was far inferior in quality to that for which market prices are recorded" (pp. 56, 57).

"In point of fact, the rent of the tenant in the time immediately before me may have been, and probably was, in its origin, as the Dialogue on the Exchequer (l. 10) states, a license to live on and cultivate the soil, always, indeed, less than a competitive rent, and perhaps, in its beginning, a precarious tenure. But in course of time the tenancy became permanent, the rent remained fixed. It was as full, indeed, as could be obtained, for I find that when land is let on lease for short periods, or for life, the rent is no higher than that paid by freeholders and copyholders, but it is not as much as could be paid, seeing that the tenants were constantly able to add to their tenancies, and were frequently called upon for extraordinary payments, which could not have been yielded from a genuine rack rent. And it is a proof of Adam Smith's sagacity, that without the materials before him from which the facts could be demonstrated, he saw that rent was originally a tax, and that a long interval must have occurred before farmers' rents became real and oppressive" (pp. 57, 58).

"There is a general impression that the Englishman in the days of the Plantagenets lived on the coarser and inferior kinds of grain. That most of the best wheat went to market, supplied the towns, and was even exported to foreign countries, is probable, or even certain, especially during the fifteenth century. But over the greater part of England, over all, indeed, which has come under my inquiry, even as far north as the county of Durham, the staple produce of agriculture, and by implication the staple food of the people, was wheat, though oats are also consumed as the food of man in those northern regions. From the earliest times wheat has been the principal grain on which the English have lived" (p. 59).

"I have dwelt in detail on these facts, and have given this evidence of the condition of the English peasantry, in order that I may, if possible, once for all show how untenable is the opinion which doubts that, as far as the mere means of life were concerned, the Englishman of the middle ages lived in ordinary times in coarse plenty" (p. 63).

"The houses of these villagers were mean and dirty. Brick-making was a lost art, stone was found only in a few places, and, though cheap enough, was certainly not generally employed, even where it was plentiful and within reach. The better class of yeomen had timber houses—housebote was a customary right of the tenants—built on a frame, the spaces being either lathed and plastered within and without, or filled with clay kneaded up with chopped straw. The floor was the bare earth, though it was sometimes pitched with split flints. The sleeping apartments under the thatched roof were reached by a ladder or rude staircase. A few

chests were ranged round the walls, the bacon-rack was fastened to the timbers overhead, and the walls of the homestead were garnished with agricultural implements. The wood fire was on a hob of clay. Chimneys were unknown, except in castles and manor houses, and the smoke escaped through the door or whatever other aperture it could reach. Artificial light was too costly for common use, for the hard fats were four times as dear as the meat of animals, and a pound of candles could only have been procured at nearly the price of a day's work.

"The floor of the homestead was filthy enough, but the surroundings were filthier still. Close by the door stood the mixen, a collection of every abomination—streams from which, in rainy weather, fertilized the lower meadows, generally the lord's several pasture, and polluted the stream. Two centuries and a half after the time of which I am writing the earliest English writer on husbandry comments on the waste, the unwholesomeness, and the agricultural value of these dunghills.

"The house of the peasant cottager was ruder still. Most of them were probably built of posts wattled and plastered with clay or mud, with an upper story of poles, reached by a ladder. In the taxing rolls of Edward I., preserved numerously in the Record Office, the household furniture of such cottages is inventoried, and valued at a very few shillings. It consists of a few articles of furniture, generally of home manufacture, some coarse bed-Rude Houses. ding, and a few domestic implements, mostly earthenware. The most valuable articles in use were copper or brass pots and a few common iron utensils, all metals being exceedingly dear; and iron, relatively speaking, being the dearest of all.

"Rude, however, and coarse as village life was, it must not be imagined that it was without its hopes and aspirations. The serf could arrange with his lord to remove to a neighboring town, and there prosecute his fortunes, perhaps emancipate himself" (pp. 67, 68).

"The tenants of the manor had a right generally to the use of wood from the lord's timber for the repair or enlargement of their homesteads, for their agricultural implements, and, to a limited extent, for their fires. On the other hand, they are prohibited from cutting oak or ash, even on their own holdings, without the lord's consent.

"Generally the use of the common pasture was without stint—*i.e.*, any tenant could put as many beasts as he liked on it" (p. 74).

"The arable land of the manor was generally communal—*i.e.*, each of the tenants possessed a certain number of furrows in a common field, the several divisions being separated by balks of unploughed ground, on which the grass was suffered to grow. The system, which was all but universal in the thirteenth century, has survived in certain districts up to living memory, though generally it gave way to inclosures, effected at a more or less remote period. The system has been traced back to remote antiquity. The ownership of these several strips was limited to certain months of the year, generally from Lady Day to Michaelmas, and for the remaining six months the land was common pasture. The communal cultivation had its advantages for the poorer tenants, since the area of their pasture was increased" (p. 88).

"The rarity of payment by the laborer is indirect evidence that the great majority of the laborers were occupied on their own holdings during a considerable part of the year. Omitting exceptional rates paid for piecework, the wages of an agricultural laborer would be at a rate of £2 11s. 8d. a year, or taking, besides Sundays, 20 days for church holidays, £2 10s. In harvest and hay-making time, which may have well lasted 5 weeks, his wages would be doubled, and this would raise them to £2 15s. His wife was paid for harvest piecework as well as he was, and could earn another 5s., raising his amount to £3. If he had 2 children fit for employment, at their rates they might raise the total earnings of the family to £3 15s., or £4.

"When the hinds were hired by the year, they received a quarter of corn, at say, 4s. every 8 weeks, and 6s. money wages—*i.e.*, about the value of 32s. a year. They were always, however, boarded in harvest-time and at periods of exceptional employment. This board, as I find from other sources, was reputed to cost from 1½d. to 1¼d. a day, and if we take 6 weeks as the time thus employed, the real wages which they received would be in the aggregate about 35s. 8d. a year. Such hinds were undoubtedly single men. Occasionally the laborer serves more masters than one, and his allowances and money are therefore reduced. Thus the swineherd is the servant of the whole village; the deye,

or dairy servant, of more than one or two; the shepherd frequently of two persons. During the harvest quarter the money wages are always three times the amount of what is paid in the other quarters. This rule is of course adopted in order to prevent the hind from deserting his employment during the most profitable time of the laborer's year, and is indirect evidence of the voluntariness of the engagement. Had the labor of the resident serf been entirely at his lord's discretion, such a distribution of money wages would have been a superfluous precaution" (pp. 170, 171).

"But though a few persons became opulent in the middle ages—exceedingly opulent by way of contrast with their countrymen—the mass of men in the rural districts were removed equally from excessive poverty and from the prospect of much wealth. They could and did make their savings add strip to strip, accumulate the wages of the harvest, and—there being little to tempt them to expenditure—constantly invest their earnings in plots of land.

"I am far from forgetting that in many material points the man in our day, who lives by manual labor, is better off than his ancestor of the thirteenth century, just as he is better off than his ancestor of the eighteenth. . . . I am aware also that all classes, though at a period long after that of which I am now speaking, shared the benefits of those great improvements in agriculture, under which fresh food is supplied all the year round; and that many forms of inveterate disease, which once afflicted humanity, have been banished, and life has been rendered easier and longer. The means of life were as plentiful, considering the population, in the thirteenth century as they were in the eighteenth, the continuity of labor was secured, and the prospects of those who lived by manual toil as good. The age had its drawbacks, as every age has, but it had its advantages; and I hope to be able to show that the peasant of the thirteenth century, though he did not possess, and therefore did not desire, much that his descendant had in the eighteenth, had some solid elements of present advantage and not a few hopes of future advancement" (pp. 68, 69).

One should not, however, be misled by Professor Rogers's somewhat highly colored view into forgetfulness of the fact that the English medieval agricultural laborer was, like his brother on the continent, a little better than the slave of the *manor*, even tho he was to an extent a well-kept slave. The manorial system furnished the framework of English medieval agricultural society, as is brought out in Professor Bohm's *The English Village Community* and Professor W. J. Ashley's *Economic History*, vol. 1., pp. 7-9. (For the details of this system, see MANORS.) It was only after the Black Death and the rising of the peasants that, altho the leaders of the revolt were defeated and the Statute of Laborers tried to tie the laborer to the soil, the serfs, nevertheless, became really free, and for a little while enjoyed what some have called the Golden Age of Merry England. Soon, however, the exhaustion of the nobles in the Wars of the Roses led them to claim as private property the lands which they had held before only as feudal rulers; they commenced to turn their lands into sheep-walks and dispossess their former feudal dependents. The confiscation of the monasteries and the turning out of the monks swelled the number of the landless class. Currency clipping and other circumstances increased the hard times, and the Golden Age soon became a leaden one.

(c) MODERN ENGLAND.

In tracing the development of agriculture from medieval to present times, there are in England two main epochs to be noted—the Tudor period and the latter part of the eighteenth century. (For full notice of the former see LAND; on the latter see POOR LAWS.)

With the close of the Wars of the Roses and the commencement of the fifteenth century begins the era of farming for profit, which characterizes the Tudor period. Feudalism was extinct; commerce progressed; the wool trade flourished; landlords required money, not retainers. Two great changes were introduced: (1) individual for common occupation; (2) the conversion of arable land into pasture.

The nobility, exhausted by the French wars

and the Wars of the Roses, began to raise wool for the Flemish wool market. They began to turn out their peasantry and to fence in the common. The landless man, the tramp, was produced. In the seventeenth and the early part of the eighteenth centuries there was some improvement, but the English Poor Law (*q. v.*) was working its dire result. Says Rogers (*Work and Wages*, p. 424):

"The legislature strove to tie the peasant to the soil, not, indeed, as a mere serf, for the act of 1589 prescribed that every laborer's cottage [to be erected] in future should have 4 acres of land attached to it—a law which roused the wrath of Arthur Young in 1770, and was no doubt habitually broken. But it also gave him, as a compensation for the policy which permitted entails and the accumulation of land in few hands, the right to be a pensioner on the soil, from all real and permanent share in which he was practically excluded. He had been robbed by the landowner, and he was to be hereafter quartered on the occupier. He had been impoverished by misgovernment, and was to be degraded by a charity which was to compensate him for the losses which he had sustained and for the hard measure which was being dealt out to him, but which would ultimately degrade him and make him helpless and hopeless. I can conceive nothing more cruel, I had almost said more insolent, than to condemn a laborer to the lowest possible wages on which life may be sustained, by an act of Parliament, interpreted and enforced by an ubiquitous body of magistrates, whose interest it was to screw the pittance down to the lowest conceivable margin, and to inform the stunted recipient that when he had starved on that during the days of his strength, others must work to maintain him in sickness or old age. Now this was what the Statute of Apprenticeship, supplemented by the Poor Law, did in the days of Elizabeth."

It should be noted, however, that there is another side to this. The Government did undoubtedly in many of its laws attempt to aid the laborer. (See POOR LAWS.) The fact was, that the claim of the lords of the soil to own the soil was creating new conditions, which the laws could not change. The landless man had appeared, and the Government knew not whether to suppress the tramp or to aid the poor. It attempted to do both, and in both largely failed.

In the latter part of the eighteenth century, however, there was another change. Says Rogers (*id.* p. 437):

"The English Poor Law would have ultimately devoured the rent of all open parishes—that is, those in which there were many owners, and consequently the possibility of housing the poor, and have enormously exalted the rent of all close parishes—*i. e.*, those in which there was one owner only, who cleared off every cottage on his domain, had it not been for the almost simultaneous discovery of steam power and the substitution of machine for hand-loom weaving. The capitalist inventors of these processes found that they wanted labor (though at first it appeared that the discoveries would dispense with labor), and were therefore indifferent to the contingencies of an unlicensed settlement. But it may be doubted whether their discoveries were an immediate boon to labor."

Agriculture was deserted. There was a rush into manufactures. Says Professor A. R. Wallace (*Land Nationalization*, p. 111):

"From that time till within the last few years the wealth of the landlords and, in a less degree, the profits of the farmers have been steadily increasing. The rent of even agricultural land has nearly doubled, and the price of much agricultural produce has doubled also. In the latter part of the last century meat was *4d.* a pound, cheese, $\frac{3}{4}d.$, butter, $\frac{6}{8}d.$, and skim-milk could be had for a halfpenny a quart, or was often given away, while wages were then about 8s. a week. In 1850 all these articles of food were much dearer, while in some parts of England wages were actually lower; and whereas during the last 20 years the above articles have been usually more than double the price, wages have been less than half as high again. But the laborer has now to pay much higher house rent, he has generally no gar-

den, and, being usually a weekly tenant, is so dependent on his landlord that he cannot make the most of what he has; the commons and roadside wastes from which he formerly obtained fuel for winter, with food and litter for a cow, a donkey, geese, or poultry, have almost all been inclosed; and the result is that he has few means of adding to his scanty wages, and is reduced to live mainly on bread and weak tea, with a little cheese or bacon and cheap artificial butter, while his children are brought up almost without knowing the taste of milk. His sole relaxation is to be found at the wayside tavern, his only prospect to end his days in the workhouse."

In a remarkable letter to the *Daily News* in 1869, Sir George Grey gave a striking picture of the social and physical degradation of the English agricultural laborer. He quotes the reports of their medical officers to the Privy Council, which tells us that: "Besides the extreme cases where houses of a parish were pulled down in the teeth of an increasing population, there were also innumerable parishes where the demolition of houses was going on more rapidly than any diminution of the population could explain. When the process of depopulation is completed, the result is a show village, where the cottages have been reduced to a few, and where none but persons who are needful as shepherds, gardeners, or game-keepers are allowed to live. But the land requires cultivation, and it will be found that the labourers employed upon it are not the tenants of the owner, but that they come from a neighbouring open village, perhaps three miles off, where a numerous small proprietary had received them when their cottages were destroyed in the close villages around." To the hard toil of the labourer there will then have to be added the daily need of walking six miles or more for the power of earning his daily bread. "But he suffers a still greater evil in the kind of dwelling he is obliged to inhabit. In the open village cottage speculators buy scraps of land, which they throng as densely as they can with the cheapest of all possible hovels, and into these wretched habitations (which, even if they adjoin the open country, have some of the worst features of the worst town residences) crowd the agricultural labourers of England." The habitual overcrowding of these wretched hovels leads to scenes and conditions of life too painful to dwell upon, and we need only quote the concluding statement. "To be subject to such influences is a degradation which must become deeper and deeper for those on whom it continues to work. To children who are born under its curse it must be a very baptism into infamy."

The Bishop of Manchester states that out of 300 parishes which he visited in Norfolk, Essex, Sussex, and Gloucestershire, only two had good cottage accommodation. . . . "The majority of the cottages that exist in rural parishes are deficient in almost every requisite that should constitute a home for a Christian family in a civilized community." Details are then given of parishes and estates of 2000 acres with one or two cottages only and sometimes none at all; and as a result 10 or 11 persons sleeping in a single bedroom.*

These are the main economic events that stand out in the history of English agriculture down to the present century. For the present condition, see part 2 of this article, section (b). No sketch of the history of

English agriculture, however, would be complete without a reference to the literature of the subject, such as *The Book of Husbandry* (1534), *Book of Surveying* (1539), *Tassier's Five Hundred Points of Industry* (1562), and Sir Richard Weston's *Discourse on the Husbandry of Brabant and Flanders* (1645) which marks the dawn of improved methods in agriculture. In 1723 a *Society of Improvers in the Knowledge of Agriculture in Scotland* was formed; and so we reach Arthur Young and the present century. (See references at the end of this article.)

(d) THE UNITED STATES.

Tillage was a chief occupation of the first settlers of the United States. In 1602 Captain Gosnold grew peas and beans in Massachusetts, and in 1611 wheat was grown in Virginia. Potatoes were introduced into Massachusetts from England in 1629. Stebbins relates that in 1637 there were 100 ploughs at work in Virginia and 37 in Massachusetts. South Carolina exported 700 bush. of potatoes in 1749, New York 70,000 bbls. of flour in 1750. Mulhall gives the following table of the increase of the grain product:

YEAR.	MILLION OF BUSHELS.			Value of Crop in Million Pounds.
	Pro-duction.	Home Con-sumption.	Exported.	
1700.....	5	5	1
1750.....	20	20	3
1775.....	60	60	8
1790.....	120	120	14
1800.....	160	160	..	18
1820.....	343	336	7	34
1830.....	463	455	8	46
1840.....	616	621	15	62
1850.....	867	855	12	97
1860.....	1,240	1,220	20	173
1870.....	1,629	1,560	60	168
1880.....	2,718	2,425	293	276
1889.....	3,454	243

The *World Almanac* gives the following table of the various kinds of grain production in the United States, taken from the United States census reports of the productions of the principal cereals in the United States in the several census years, together with the reports of the United States Department of Agriculture for 1885-92:

YEAR.	Indian Corn.	Wheat.	Oats.	Barley.	Rye.	Buckwheat.
	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>
1850.....	592,071,104	100,485,940	146,584,179	5,107,015	14,188,813	8,956,912
1860.....	838,792,742	173,104,924	172,043,185	15,825,808	21,101,380	17,571,818
1870.....	760,944,549	287,745,626	282,107,157	29,701,305	16,918,795	9,821,721
1880.....	1,754,861,535	459,479,503	407,858,900	44,113,495	19,831,595	11,817,327
1885.....	1,926,176,000	357,218,000	629,499,000	58,306,000	21,756,000	12,626,000
1886.....	1,695,441,000	457,320,000	624,134,000	59,428,000	24,480,000	11,869,000
1887.....	1,456,161,000	455,320,000	659,618,000	55,812,000	20,591,000	10,844,000
1888.....	1,937,709,000	415,868,000	701,735,000	63,984,593	28,113,911	12,000,000
1889.....	2,112,802,000	490,560,000	754,515,000	165,000,000	30,000,000	11,000,000
1890.....	1,489,970,000	390,262,000	523,621,000	163,000,000	28,000,000	11,000,000

1892.....	1,628,464,000	515,949,000	661,935,000	179,000,000	†39,000,000	†11,000,000

The importance of the agricultural interests

* Appendix to First Report of the Commission appointed to inquire into the condition of women and children employed in agriculture.

† Estimated by the Cincinnati *Price Current*.

may be also seen from the proportion of our people engaged in agriculture. The decennial censuses furnish the following figures as to the employment of the people. The first column refers to the total of those engaged in definite occu-

pations—i.e., those specified in the other columns :

	Total engaged in Occupations.	Agriculture.	Manufacturing, Mechanical, and Mining Pursuits.	Commerce and Transportation.	Personal and Professional Services.
1840....	4,796,407	3,717,756	806,748	206,667	65,236
1850....	5,371,876	2,400,586	1,034,469	561,796	99,038
1860....	8,287,043	3,305,135	1,311,446	529,335
1870....	12,505,923	5,922,471	2,707,421	1,191,238	2,684,793
1880....	17,392,099	7,670,493	3,837,112	1,810,256	4,074,238

According to the Report of the Secretary of Agriculture for 1893, there are in the United States to-day about 6,000,000 farms on which dwell over 30,000,000 people.

The history of agriculture in the United States divides itself naturally into four main periods : I. The colonial period ; II. From the War of Independence to about 1840, when railroads began to be built ; III. From 1840 to the War of the Rebellion ; IV. To the present time.

In the early colonial period tools were scarce, population sparse, labor often dangerous and usually expensive and unremunerative.

An English writer, Gee (*On Trade*, London, 1750), says: "If we examine into the circumstances of the inhabitants of our plantations and our own, it will appear that not one-fourth part of their product redounds to their own profit ; for out of all that comes here they only carry back clothing and other accommodations for their families, all of which is of the merchandise and manufacture of this kingdom. . . . All these advantages are received from the plantations, besides the mortgages on the planters' estates and the high interest they pay us, which is very considerable ; and therefore very great care ought to be taken that they are not put under too many difficulties, but encouraged to go on cheerfully."

Indian corn was the main native crop, wheat, oats, and rye being introduced from England. Slave labor was common, and in portions of the country, North as well as South, all but universal.

The War of Independence affected the development of agriculture seriously, but after the close of the war it began to revive. Attention was given to the breeding of horses, and about 1825 to neat cattle. The invention of the cotton-gin in 1794 by Eli Whitney, and the care taken by American planters to improve the stock by careful selection and cultivation of seed, soon placed the country in the foremost rank in the production of this great staple.

A notable fact of this period was the great extension of the national area by the acquisition of Louisiana in 1803 and of Florida in 1821. From 899,615 square miles in 1783 the country was enlarged to more than 2,000,000 square miles in 1833. To utilize the northern part of the Mississippi Valley two great routes westward were created—the National Road through Wheeling and Columbus by the United States Government, and the Erie Canal by the State of New York.

The third period, from 1840 to the War of the Rebellion, began under great financial depression (see CURRENCY), but soon developed great prosperity.

The spread of railroads and the extent of the national domain developed a new West. The American reaper was invented by Hussey in 1833, and McCormick in 1834. Hereafter inventions and improvements in agricultural machinery became continuous. Improvements in cattle and horses and swine were rapid. Land speculation set in, but was checked by the passage of the Homestead Law (*q.v.*). The production of sugar became an American industry by the annexation of Louisiana. In 1839 Congress voted \$1000 for the investigation and collection of agricultural statistics and to procure seeds and cuttings for gratuitous distribution. This was the beginning of Government reports, which were issued through the Patent Office until the Department of Agriculture was organized in 1862. Between 1840 and 1850, five State societies were

formed, and from this time State and district associations increased rapidly.

The first agricultural paper was *The American Farmer*, begun at Baltimore in 1830.

The period of the war affected the South badly, but nevertheless aided it in one direction, by making it agriculturally independent of the North. The North did not materially suffer. Prairies ploughed, planted, tilled, and their crops harvested by machinery raised crops which fed our people, our armies, and began to feed Europe. The Homestead Law became law in 1862, and rapidly accelerated the development of the new West. Immigration from Europe at once set in. Agricultural education was developed. The first American agricultural college was established at Cleveland, O., in 1855. In 1862 Congress granted from the public domain to each State 30,000 acres for each Senator and Representative in Congress, "in order to promote the liberal and practical education of the industrial classes." In some States this was given to regular colleges and used to endow an agricultural department. In others it was used to found agricultural colleges or to endow those already existing. In New York it availed for the endowment of Cornell University. The United States Department of Agriculture was organized in 1862, and State boards have developed rapidly since. Experiment stations also contributed their help. In 1867 the organization of the Patrons of Husbandry, or Grangers, was established (see GRANGERS); but this already brings us to the present time. (See FARMERS' MOVEMENT.)

II. Statistics of Agriculture.

(a) THE UNITED STATES.

Census Bulletin 378, prepared under the supervision of Mr. W. H. Olcott, in charge of the division of agriculture of the Census Office, shows for the United States, by geographical divisions and by States and Territories, the principal statistics of agriculture as obtained at the Eleventh Census.

In enumerating farms, no farm was reported of less than three acres unless \$500 worth of produce had been actually sold from it during the year ; and all land once plowed was considered improved, unless afterward abandoned for cultivation.

The value of products was estimated by the farmers when there was no exact account kept of the same.

The statistics relating to the cultivation of potatoes and hay do not appear in this bulletin, as their revision has not been completed.

The table shows the number, area, and valuation of farms in 1890, live stock on hand June 1, 1890, and the agricultural products for the year 1889. The figures are preliminary and subject to modification in the final report.

FARMS.

The total number of farms enumerated in 1890 was 4,564,641, as compared with a total of 4,008,907 in 1880, an increase of 555,734, or 13.86 per cent.

The total area of land in these farms in 1890 was 623,218,619 acres, 357,616,755 acres of which were improved. In 1880 there were 536,081,833 acres in farms, 284,771,042 acres of which were improved. Therefore, there was an increase of 87,136,784 acres, or 16.25 per cent., of the total land in farms, and 72,845,713 acres, or 25.58 per cent., improved.

The percentage of the total land surface in farms in 1890 was 32.79, as compared with 28.20 in 1880, and the percentage of the total farm area that remained unimproved at the latter date was 42.62, as compared with 46.88 at the former.

The value of these farm lands, including fences and buildings, was in 1890, \$13,279,252,649 and in 1880 \$10,197,006,776, showing an increase of 30.23 per cent. in their valuation since 1880.

The value of farm implements and machinery in 1890 on these farms was \$494,247,467 and in 1880, \$406,520,055, showing an increase of 21.58 per cent. since 1880.

The value of live stock on hand June 1, 1890, on these farms was \$2,208,767,573 and the value in June, 1880, was \$1,500,384,707, showing an increase of 47.21 per cent. since 1880.

In the year 1889 the value of farm products was \$2,460,107,454 and in the year 1879 the value was \$2,212,540,927, showing an increase of 11.19 per cent. since 1880.

LIVE STOCK AND LIVE-STOCK PRODUCTS ON FARMS.

There were 14,959,467 horses on farms in 1890, which was an increase of 4,611,979, or 44.53 per cent., over the number reported in 1880. Of this number, 8,571,177, or 57.26 per cent., were reported in the North Central division. There were 289,316 horses reported on ranges in 1890, making the total number, including both those on farms and on ranges, 15,258,783.

There were 2,295,532 mules and asses on farms in 1890, which was an increase of 482,724, or 26.63 per cent., over the number reported in 1880. Of this number, 1,093,722, or 47.65 per cent., were reported in the South Central division. There were 19,253 mules and asses returned as on ranges in 1890, making the total number, including both those on farms and on ranges, 2,314,785.

There were 57,499,583 swine on farms in 1890, which was an increase of 9,727,883, or 20.40 per cent., over the number returned in 1880. Of this number, 37,624,632, or 65.54 per cent., were reported in the North Central division. There were 15,704 swine reported as on ranges in 1890, making a total, including both those on farms and on ranges, of 57,425,287.

There were 1,117,494 working oxen, 16,511,950 milch cows, and 33,734,728 other cattle, making a total of 51,363,572 neat cattle on farms in the United States on June 1, 1890, as compared with 993,841 working oxen, 12,443,120 milch cows, and 22,488,550 other cattle, making a total of 35,925,511 in 1880. There is therefore an increase of 123,653, or 12.44 per cent., in the number of working oxen, of 4,068,830, or 32.70 per cent., in the number of milch cows, and of 11,245,578, or 50.01 per cent., in the number of other cattle, the increase in the total number of neat cattle on farms being 15,438,061, or 42.97 per cent. In addition to the above there were 6,285,220 neat cattle reported on ranges June 1, 1890, making a total of neat cattle on farms and ranges of 57,648,792.

The total production of milk on farms in the United States in the year ending December 31, 1889, was 5,200,125,567 gals., equivalent to 315.48 gals. for each milch cow reported on June 1, 1890, and to 83.78 gals. per head of population.

Statistics.

The total production of butter on farms in the year ending December 31, 1889, was 1,024,223,498 lbs., as compared with a total of 777,250,287 lbs. in 1879, and the total production of cheese 18,726,818 lbs., as compared with a total of 27,272,489 lbs. in 1879, an increase of 246,973,181 lbs., or 31.73 per cent., in the production of butter on farms and a decrease of 8,545,671 lbs., or 31.33 per cent., in the production of cheese on farms.

It should be borne in mind that the above figures for butter and cheese represent only that which has been produced on farms, and does not include the amount made in cheese and butter factories, the returns of which will appear in the report on manufactures, although the total of milk produced is shown.

The total number of sheep, exclusive of spring lambs, on farms in the United States on June 1, 1890, was 35,935,364. The number of fleeces shorn in the fall of 1889 and spring of 1890 was 32,126,868, yielding 165,449,239 lbs. of wool, or an average of 5.15 lbs. per fleece.

The total number of sheep on farms in 1880 was 35,192,974, yielding 155,681,751 lbs. of wool, or an average of 4.42 lbs. per fleece.

There was therefore an increase from 1880 to 1890 of 743,299, or 2.11 per cent., in the number of sheep and of 9,707,488, or 6.27 per cent., lbs. of wool.

In addition to the sheep and wool reported on farms there were 4,940,948 sheep and 25,828,845 lbs. of wool reported on ranges, which would make a total of 40,876,312 sheep and 191,278,034 lbs. of wool in the United States.

The figures appearing in this bulletin as to the amount of wool clipped are from the definite returns made to the Eleventh Census, and do not include the estimated amount of pulled wool or of wool that might have been clipped in the summer of 1890 after the enumeration of June 1.

As the live stock on ranges in 1880 was largely estimated, there are no comparisons made in this bulletin except for the live stock on farms. The following statement will show the live stock on ranges in the United States in 1890 as gathered by special agents :

Horses.....	289,316
Mules and asses.....	19,253
Swine.....	15,704
Neat cattle.....	6,285,220
Sheep.....	4,940,948

FIBERS.

The total area devoted to the production of cotton in the United States in 1889 was 20,175,270 acres, and the total production in the fall of 1889 and the early winter of 1889-90 was 7,472,512 bales of 477 lbs. net, amounting to 3,564,387,747 lbs., an average of 176.67 lbs. to the acre.

In 1879 the total area devoted to cotton was 14,480,019 acres and the total production, 6,755,359 bales of 453 lbs. net, amounting to 2,607,177,627 lbs., an average of 180.05 lbs. to the acre.

There is, therefore, an increase of 5,695,251 acres, or 39.33 per cent., in the area and 957,210,120 lbs., or 36.71 per cent., in the production.

The returns which were made to the Census Office in bales have been reduced to pounds in accordance with the figures appearing in the statistical abstract prepared by the Bureau of Statistics of the United States Treasury Department in 1890. It will be noted that the weight per bale is heavier in 1890 than in 1880.

There were 1,318,698 acres devoted to the cultivation of flax in the United States in 1889, 1,301,137 acres, or 98.67 per cent., being in the North Central division. There were 10,250,410 bush. of flaxseed produced, 98.40 per cent. of which was in the North Central division. There were 241,389 lbs. of fiber produced, 72.09 per cent. of which was in the North Central division.

There were 25,054 acres devoted to the cultivation of hemp in the United States in 1889, 23,468 acres of which, or 93.67 per cent., were in the State of Kentucky, the total production in the United States being 11,511 tons, 10,794 of which, or 93.77 per cent., were in the State of Kentucky, Illinois being the only other State producing over 100 tons.

CEREALS.

The area devoted to the cultivation of cereals in the United States in 1889 was 140,217,545 acres, and the total production of cereals, 3,518,316,904 bush., such acreage and production being distributed among the different cereals as follows :

PRODUCTS.	Acres.	Bushels.
Corn.....	72,087,752	2,122,327,547
Wheat.....	33,579,514	468,373,968
Oats.....	28,320,677	809,250,666
Barley.....	3,220,834	78,332,976
Rye.....	2,171,604	28,421,393
Buckwheat.....	837,164	12,110,349

This area of 140,217,545 acres is an increase of 21,585,766 acres, or 18.20 per cent., since 1879. This increase, however, is not keeping pace with the growth of population, which increased 24.86 per cent. between 1880 and 1890, the area per capita being 2.24 acres as compared with 2.37 at the Tenth Census, a decrease of 0.13 acres per capita. There has been an increase in the production of cereals since the Tenth Census of 821,236,675 bush., or 30.44 per cent., the total production per capita being 56.19 bush. as compared with 53.78 bush. at the Tenth Census, showing an increase of 2.41 bush. per capita.

Of the area under cereals in the United States in 1889, 51.41 per cent. was under corn, 23.95 per cent. under wheat, 20.20 per cent. under oats, 2.29 per cent. under barley, 1.55 per cent. under rye, and .60 per cent. under buckwheat, as compared with 52.57 acres under corn, 20.87 acres under wheat, 13.61 acres under oats, 1.63 acres under barley, 1.55 acres under rye, and .72 acres under buckwheat in every 100 acres under cereals in 1879.

TOBACCO.

There were 695,301 acres devoted to the cultivation of tobacco in the United States in 1889, yielding a product of 488,256,646 lbs., an increase of 15,595,489 lbs., since 1879.

RICE.

There were 161,312 acres in the United States in 1889 devoted to the cultivation of rice, all of which were reported from 10 States, principally from Louisiana and South Carolina, the production amounting to 128,590,934 lbs.

VARIOUS STATISTICS.

The following statements are all taken from the report of the Secretary of Agriculture for 1893 (printed in 1894).

The expenses of the Department of Agriculture dur-

ing the first quarter of the present year aggregate but \$345,876.76, as against \$402,012.42 for the parallel period of the fiscal year 1893.

The first United States Commissioner of Patents, Henry L. Ellsworth, in the year 1836 conceived the idea of distributing new and improved varieties of seed among the farmers of the United States, and from that time he patriotically procured the seed and distributed it at his own expense until the year 1839, when, upon his recommendation, Congress appropriated \$1,000, to be taken from the Patent Office funds, for the purpose of collecting and distributing rare and improved varieties of seeds, and prosecuting agricultural investigations and procuring agricultural statistics. And from this small beginning, 54 years ago, the Seed Division of the Department of Agriculture has grown to its present unwieldy, unnecessary, and extravagant proportions, so that in the year 1892 there was appropriated the sum of \$135,400 for the purpose of purchasing seeds, bulbs, and cuttings for gratuitous distribution.

The State Weather Service Division supervises 42 State weather services, covering the whole of the United States, except Alaska. It also establishes and supervises all voluntary observations and forecast display stations, and the services in the cotton, sugar, and rice regions, and publishes the National Weather Crop Bulletin.

Weather Service.

The 2500 voluntary observers forward copies of their records to the central stations of their respective local services for use in the preparation of the reviews published monthly. Many of these State reviews are of a highly creditable character and valuable in determining the climatic characteristics of the various States and Territories. For distributing weather forecasts and special warnings all available means have been utilized, and while the number of stations supplied at Government expense by telegraph or telephone has been materially decreased during the year, the number of those to which forecasts, etc., are furnished at little or no cost has been largely augmented.

Full forecasts are now received at 1622 stations, a reduction of 200 during the year; but nearly 5000 places received them gratuitously, an increase of over 1000 in the same period. Plans now being perfected will, it is believed, increase the number of stations receiving forecasts without expense to the Government by 1500 to 2000 in the near future. A number of railroad companies are effectively cooperating with the Bureau in the distribution of forecasts by telegraph. It is believed that during the coming year it will be possible to extend the system to every community having interests to be benefited.

The daily weather map is now issued at 72 stations of the Weather Bureau outside of Washington, D. C. The average issue is about 8000 copies, or about 2,500,000 copies annually—a slight increase over last year. These figures by no means express the demand, which has grown to such proportions that it has sorely taxed the capabilities of the station force and the store of supplies.

The exports of agricultural products from the United States for the fiscal year ending June 30, 1892, attained the enormous figure of \$809,000,000 in round numbers, being 78.7 per cent. of our total exports. In the fiscal year following this aggregate was greatly reduced, but nevertheless attained the very respectable figure of \$615,000,000, being 74.1 per cent. of all American commodities exported. The value of the foreign markets to our farmers and to the entire population of the United States can, therefore, hardly be overestimated.

There are in the United States more than 6,000,000 of farms. Upon them dwell more than 30,000,000 of the population of this republic. Those farm dwellers furnish more than 74 per cent. of the value of the exports of this country.

At present a review of our agricultural exports, with special reference to their destination, will show that in almost every line the United Kingdom of Great Britain and Ireland absorbs by far the largest proportion. A few figures, showing exports of our principal agricultural products, will emphasize this very clearly.

Of cattle, the total exports aggregated in value, for 1892, \$35,000,000, of which Great Britain took \$34,000,000; and in 1893, \$26,000,000, of which the same country took considerably over \$25,000,000.

Of beef products of all kinds, our total exports for 1892 exceeded in value \$31,000,000, of which \$25,000,000 went to Great Britain; and in 1893, \$28,000,000, of which Great Britain took \$24,000,000.

Of pork products, the total exports for 1892 aggregated in value \$85,000,000, of which Great Britain took \$47,000,000; and in 1893, \$84,000,000, of which Great Britain took \$53,000,000.

Nearly the same average proportions prevail in breadstuffs and minor products, while in cotton they are even more conspicuous.

Our total exports of corn for 1892 were \$41,000,000, of which \$20,000,000 went to Great Britain; and in 1893, \$24,000,000, of which \$9,000,000 went to Great Britain.

Our total exports of wheat for 1892 were valued at \$161,000,000; of this, Great Britain paid \$68,000,000. For 1893 the total exports of wheat were of the value of \$93,000,000; Great Britain took of this \$58,000,000.

Of wheat flour, the total exports for 1892 were \$75,000,000; to Great Britain, \$47,000,000. In 1893 the total exports were about the same as for 1892, while Great Britain took \$48,000,000.

The total exports of cotton for 1892 were \$258,000,000; to Great Britain, \$146,000,000. In 1893 the exports of cotton were valued at \$188,000,000; to Great Britain were sent \$99,000,000.

These figures prove not only how large a proportion of our total agricultural exports find their way to Great Britain and Ireland, but also how very large a proportion of our total agricultural exports is made up of a comparatively few leading crops. It must not be forgotten that in the universal competition for enlarged trade constant efforts are being made, and will continue to be made, by other countries producing a surplus of agricultural products, to wrest from us the supremacy we now hold in supplying Great Britain and a few other countries that are not self-providing in such products; that many of these other countries are British colonies, and that, except as regards cotton, there are none of which we enjoy the practical monopoly.

A review of our agricultural exports prompts a consideration of our agricultural imports.

This reveals a large value in our imports of agricultural products. The question then comes up whether some, perhaps much, of this great total of annual agricultural imports, aggregating in value some \$350,000,000, ought not to be produced upon our own soil, in proximity to those of our own markets, where this immense demand exists?

The time will surely come when, under the favorable conditions of soil and climate which this country possesses, a very large share of agricultural products now imported will be raised by American farmers. Our large imports of hides, fruits, nuts, and wines, aggregating an average of over \$60,000,000 annually, could all be produced in this country. A considerable share of the fibers, including wool and silk, and, no doubt, a large portion of the tobacco now imported, could also be produced in the United States.

PRINCIPAL CROPS, 1893.

Corn.

The area devoted to corn as estimated for the crop of 1893 makes an increase over that of 1892 of 1,409,807 acres, and was less by 40,737 acres than the census crop of 1889.

Wheat.

The total breadth harvested is estimated at 34,629,418 acres, as against 38,554,430 in 1892, a falling off of about 3,925,000 acres. This is the lowest average estimate of acreage in the 14 years from 1880, inclusive, except that of 1885, and but 440,000 acres more than for that year. It is less than 2,640,744 acres than the average of the period 1880-89, and 3,556,742 acres less than the average of the three years 1890-92. This diminution in the breadth was due in part to abandonment and a devotion to other crops of parts of the acreage sown, because of the unfavorable winter and the dry summer season. It was also, to some extent, an effect of low prices. The reduction of area was greatest in such surplus winter wheat States as Illinois, Missouri, Kansas, and California, and the range of decrease in the spring-wheat States of North and South Dakota and Minnesota was from 5 to 10 per cent.

The total product as estimated amounts to 396,131,725 measured bush, which is about 3,000,000 bush less than the crop of 1890, 215,648,275 less than that of the crop of 1891, and 119,818,275 less than that of 1892. This aggregate production falls below the average for the 10 years 1880-89 to the amount of 533,563,634 bush, and is 84,648,956 bush less than the average crop for the four years 1890-93, inclusive.

Notwithstanding this remarkable falling off in the total product, there has been a fall in the price per

bushel, so that the farm value of the crop is estimated at the comparatively low amount of \$213,171,381, which is the lowest recorded since 1863. The average farm price per bushel is estimated at 53.8 cents, making an average farm value per acre to the cultivator of \$6.16,

which is \$6.84 less than the average for the period 1870-79; \$3.81 less than the average for the decade 1880-89, and \$3.11 below the average for the four years 1890-93, inclusive.

Wheat crops of the 14 years 1880-93, with averages for two decades:

Oats.

The estimated area of oats shows an increase of about 209,000 acres over the crop of 1892. No advantage, however, was obtained from the enlargement of the area, as the aggregate yield was 22,180,150 bush, less than that obtained from the crop of the year previous. The average yield to the acre was 23.4 bush, against 24.4 in 1892. It was a little more than 3 bush, less per acre than the average yield for the 10 years 1880-89, and was slightly less than the average yield of the last four years, 1890-93, inclusive. The farm value of the

crop, \$187,576,092, was \$21,677,519 less than that of 1892. The average value per acre was \$6.88, the lowest since 1889, and was \$1.34 below that of the decade 1880-89.

Hay.

The estimates for hay place the acreage at 49,613,469 acres, from which were harvested 65,766,158 tons, valued at \$570,882,872. This is an increase in acreage over the estimates of 1888 of 11,021,566 acres, which is made up mostly in States beyond the Mississippi. The increase in product was something over 10,000,000 tons, the increase in aggregate value being \$161,383,307. The dif-

ference between the acreage of 1888 and that of 1893, if the figures be accepted as correct, would show a greater increase than can reasonably be accounted for in view of the conditions surrounding agricultural growth in the last five years. It must, therefore, be accounted for by the supposition that the figures of 1888 were greatly below the actual acreage at that date.*

SUPPLY AND DISTRIBUTION OF WHEAT FOR 25 YEARS.

It has for many years been assumed in all estimates of food consumption made by this department that the average quantity of wheat consumed in the United States is 4½ bush. per capita. On this basis, with a population estimated for September 1, 1893 (midway between March 1, 1893, and March 1, 1894), at 67,188,250, the total quantity of wheat consumed for food in the United States would be, in round numbers, 214,000,000 bush. The consumption for seed in the spring and fall of 1893 is estimated at 49,000,000 bush., making a total of 263,000,000. Adding to this the exports, the visible supply on March 1, 1894, and the supply in farmers' hands at the same date, as shown by recent returns to this department, we get the following statement as to the distribution of the wheat supply during the year ending March 1, 1894:

Millions of Bushels.

Consumption for food.....	314
Consumption for seed.....	49
Exports.....	176
Visible supply March 1, 1894.....	76
Supply in farmers' hands March 1, 1894.....	114

Total distribution..... 729

The supply, on the other hand, was reported as follows:

Visible supply March 1, 1893.....	79
Supply in farmers' hands March 1, 1893.....	135
Crop of 1893.....	390

Total supply..... 610

Apparent discrepancy..... 119

There is reason to doubt, however, whether the consumption of wheat for food during the year ending March 1, 1894, has been as great as 4½ bush. per capita. It is not probable that there has been any reduction in the quantity of wheat bread actually eaten, but in the matter of waste there was a wide margin for retrenchment. During the pinching times of the past fall and winter many a crust and many a fragment of stale bread which ordinarily would have found its way to the swill-barrel has undoubtedly been used to satisfy human hunger or to ward it off. This has been the case not merely in occasional instances, but in thousands of families; for, besides the cases of pinching want arising from actual loss of employment, there has been a still larger number in which employment has been only partial, or in which wages have been materially reduced. Even among many of those in comfortable circumstances there has been increased care in the saving of food for the benefit of the needy, on whose behalf the appeals for help have been so frequent and so urgent. If the cheapness of wheat during the period in question may seem to have been favorable to a continued use of an unstinted supply of bread, it must be observed, on the other hand, that the price of baker's bread has not generally fallen, and that the large proportion of our urban populations who depend on such bread have not received the normal benefit due them as a result of the low price of wheat.

IMPORTANT WHEAT CROPS OF THE WORLD.

The following table shows the world's production of wheat by countries for the year 1893 as compared with that of 1892 and 1891. The latest official returns for the different countries were used wherever available. In certain cases these official statements are preliminary and may be changed by the corrected estimates. There is little doubt, for instance, that the estimates for Germany and Russia will be reduced by the final

returns. Many countries make no official estimate of wheat production, and in such cases the most trustworthy commercial estimates were taken. The bushel used is the Winchester bushel, which has a capacity of 2,150.42 cubic inches. Where quantities were given by weight they were reduced to bushels under the assumption that 60 lbs. of wheat make a Winchester bushel. The crops of the countries in the Southern Hemisphere are those gathered in November and December, 1892, and in January and February, 1893.

In North America the total production of wheat in 1893 was 447,479,000 bush., a decrease of nearly 127,000,000 as compared with the preceding year and of 237,000,000 as compared with 1891. The large extension of the wheat area in Argentina brought up the production of South America from 51,000,000 in 1892 to 82,000,000 in 1893, an increase of 61 per cent. Europe produced 27,000,000 bush. more in 1893 than in the preceding year. Asia's share of the world's wheat production was 346,000,000 bush. as against 299,000,000 in 1892 and 345,000,000 in 1891. Africa's crop was 35,500,000, an increase of 1,000,000 bush. over 1892. Australasia's outturn stood at 41,000,000 bush. as compared with 36,000,000 in 1892 and 33,000,000 in 1891. The total world's crop of wheat for 1893 is estimated at 2,385,360,000 bush., which is less by 7,000,000 than the crop of 1892 and exceeds the crop of 1891 by about 21,000,000 bush.

BEET SUGAR.

The following table presents Mr. Licht's estimate of the beet-sugar production of Europe for the season 1893-94 as compared with preceding campaigns:

* Since this paragraph was written the figures of the last census, though not yet published, have been obtained from the Census Office, and show the area mown in 1889 to have been 52,948,797 acres, and the product obtained to have been 66,831,480 tons.

(b) BRITISH EMPIRE.

Great Britain.

Up to the middle of the last century agriculture in Great Britain was fairly prosperous ; since then the development of the manufacturing and commercial interests has on the whole reacted unfavorably on English agriculture. The careful studies of Arthur Young in the latter part of the last century created much progressive thought on the subject, and a Board of Agriculture was established in 1793, while the Napoleonic wars unduly stimulated English agriculture ; but then came a sudden reaction. The farmers suffered severely by sheep rot and bad harvests, and the condition of the agricultural laborers was pitiful. In 1845 a General Inclosure Act was passed, and a commission appointed which has since become the English Land Commission. The repeal of the Corn Laws (1846) temporarily depressed but did not permanently hurt the land interest, as was feared. The terrible condition of the agricultural laborers was slightly alleviated, and down to 1873 English agriculture was more prosperous. Since 1873, however, agriculture has been very much depressed. Down to 1882 there were a succession of bad

crops, accompanied by falling prices in corn, and since 1882 there has been a general decline in prices. Scientific farming has, however, been considerably developed, and landlords have done somewhat to improve their estates. The fall of agricultural land rents has been great. According to the evidence of Sir James Caird before the Commission on the Depression of Trade in 1886, the annual income of landlords, tenants, and laborers was £42,800,000 less in 1886 than in 1876. The cultivated land of Great Britain occupied by owners was, June 5, 1893, 4,672,077 acres, or only 14.3 per cent. of the whole, and by tenants, 27,971,632, or 85.7 per cent.

The official agricultural returns for 1886 state that the proportion of land held by tenants is slightly increasing.

The following table from the same returns for 1893 (p. xxvii.) shows the areas devoted to different crops in 1873 and 1893 :

CROPS.	1873.	1893.
Cultivated area, acres	46,927,000	47,980,000
Permanent grass, "	23,364,000	27,700,000
Corn crops, acres, "	11,423,000	9,171,000
Wheat, "	3,670,000	1,955,000
Oats, "	4,198,000	4,436,000
Cattle, number	10,154,000	11,208,000
Sheep "	33,982,000	31,775,000
Pigs "	3,564,000	3,278,000

The following table (p. xxix.) tells the story of prices :

YEAR.	Wheat.		Barley.		Oats.	
	<i>Per Quarter.</i>	<i>Per Quarter.</i>	<i>Per Quarter.</i>	<i>Per Quarter.</i>	<i>Per Quarter.</i>	<i>Per Quarter.</i>
	<i>s.</i>	<i>d.</i>	<i>s.</i>	<i>d.</i>	<i>s.</i>	<i>d.</i>
1873	58	8	40	5	25	5
1878	46	5	40	2	24	4
1883	41	7	31	10	21	5
1888	31	10	27	10	16	9
1893	26	4	25	7	18	9

The total number of people engaged in England and Wales in agriculture and fishing, taken together, in 1891 was 1,336,945. The total value of the principal crops produced in Great Britain in 1893 and Ireland in 1892 in thousands of bushels was as follows :

CROPS.	Gt. Britain.	Ireland.
Wheat	49,247	2,214
Barley	59,535	6,454
Oats	112,867	51,886

In 1892 there was imported into the United Kingdom £24,857,902 of wheat, £12,267,433 of wheat flour, £9,425,211 of maize, £5,013,546 of oats, £4,313,902 of barley.

The amount of live stock in the United Kingdom in 1894 was : Horses, 2,067,549 ; cattle, 11,510,417 ; sheep, 33,672,208 ; pigs, 3,265,898. The condition of the agricultural laborer is stated by the Royal Commission on Labour to be much improved since the terrible days before 1834 or even 1850. Even yet, however, his wages, as based upon 38 estimates of the mean rates for all the districts inquired into by the Assistant Commissioners on Agricultural Labor, is stated to be only 12s. 5d. per week. The Richmond Commission of 1870-81 put it 13s. 2d. per week. The average earnings of the Scotch agricultural laborers are said to be about 18s. 0d. per week. Much attention has been given to allotments in England. The Allotment Act of 1887 appointed a com-

mission on the subject, and authorized compensation for growing crops, etc. The Local Government Act of 1894 empowers the parish-councils to acquire, compulsorily if necessary, land to be given out in allotments. The number of British allotments, detached from cottages and under one acre, was: In

1873.....	246,308
1888	357,795
1890.....	455,005

Rents for small cottages in England vary from 0/2 to 7s. per week. In Scotland they are usually let with the farms. A Board of Agriculture was established in 1889. A National Agricultural Union has recently been formed to aid land-owners, give State-aided pensions to workmen, to establish a Produce Post, improve the Agricultural Holdings Act, etc. The English Land Restoration League (*q.v.*) is working, on the other hand, through the Red Van movement to preach collectivist ideas among the agricultural laborers.

THE COLONIES.

India is chiefly an agricultural country. Since 1870, the Indian Government has systematically worked to foster and improve Indian agriculture. The following table, taken from the Official Statistical abstract relating to British India for 1892

(p. 143), shows the amount of land held direct from Government in 10 provinces of British India; and also the number of estates, of holders, the average area of each estate, and its average assessment in rupees. Statistics for Bengal and Bombay are not available:

ADMINISTRAT-ION.	No. of Estates.	No. of Holders.	Average Area of each Es-tate.	Average Assess-ment.
			Acres.	rs. a. p.
Madras	3,389,508	5,648,504	158	15 9 4

Upper Burma ..	508,017	506,804	5.13

The Statesman's Year-Book gives the following statement of land tenure and revenue in India:

"In provinces where the zamindari tenure prevails (*i.e.*, where single proprietors or proprietary brother-hoods possess large estates of several hundreds or thousands of acres), the State revenue is assessed at an aliquot part (usually about one half) of the ascertained or assumed rental. The revenue is payable on each estate as a whole; the assessment remaining unchanged for the period of settlement. In provinces where the rayatwari tenure prevails (*i.e.*, where each petty proprietor holds directly from the State, as a rule cultivates his own land, and has no landlord between him-self and the government), the revenue is separately assessed at an acreage rate on each petty holding, and land revenue becomes payable at once (or after a short term of grace in the case of uncleared lands) on all ex-tensions of cultivation. The rayatwari proprietor may throw up his holding, or any portion of it, at the begin-ning of any year after reasonable notice, whereas the zamindar, or large proprietor, engages to pay the re-venue assessed upon him throughout the term of the set-tlement."

The following table, from the same source, shows, so far as returns are available, the class of tenure in each province:

* From official agricultural returns for 1886.

AUSTRALASIA.

According to the *Australian Handbook* for 1894 (p. 121), by the returns collected for 1892 in Australasia, 9,468,049 acres of land were under cultivation. The principal crops were: Wheat, 3,822,950 acres; oats, 566,072 acres; barley, 88,322 acres; hay, 1,329,902 acres; potatoes, 109,005 acres; other, 3,552,698 acres. The live stock in 1892 was: Horses, 1,832,815; cattle, 12,437,165; sheep, 121,884,669; pigs, 1,112,316.

Concerning the land tenure and condition of agriculture, the report on Australasia of the Royal Commission on Labour says of the different colonies:

"Under the Land Act of 1890 pastoral lands are leased in Victoria in allotments capable of carrying from 1000 to 4000 sheep and 150 to 500 head of cattle, for any term not exceeding 14 years, from December, 1884. The rent of these allotments is computed at 1s. per head of sheep and 5s. per head of cattle. On the expiration of the lease the lessee is paid by the incoming tenant for the value of all improvements. The lessee may purchase 320 acres as a homestead during the currency of his lease. Agricultural and grazing lands are leased in areas not exceeding 1000 acres for the same term of years; at the end of the term the land reverts to the Crown, and an allowance is made for improvements. Agricultural allotments, not exceeding 320 acres, may be selected after the issue of a grazing lease, which must be improved during the first five years to the value of £1 an acre. The holder pays rent at the rate of 1s. an acre, and at the expiration of six years may purchase his holding at 14s. an acre, or lease it at 2s. an acre for 14 years, after which it becomes freehold. In New South Wales the territory is divided into three zones—eastern, central, and western. The maximum territory allowed in the eastern division is 640 acres, in the central, 2560. In addition to the selection, an area, not to exceed three times that of the selection, may be leased at an annual rental, with right to purchase

during the currency of the lease. A first payment of 2s. an acre must be made in advance, and after an interval of three years the next instalment of 1s. an acre is payable. In Queensland the maximum area which may be selected is 100 acres for homesteads and from 320 to 1280 for other selections. The selector occupies the land under a licence at a rental of not less than 3d. an acre. If he complies with conditions as to fencing and similar matters, he may obtain a lease for 50 years, and his rent will be fixed by the Land Board every five years. He may purchase at not less than 20s. an acre on proving residence for five years, rent already paid being reckoned as purchase-money. In South Australia leases with the right to purchase are issued for 21 years, and the purchase may be made after six years' rental, at not less than 5s. an acre. In the southwestern district of Western Australia the maximum area which may be selected is 100 acres, but in the other divisions of the colony land may be taken up by selectors, who need not reside, in areas of from 100 to 5000 acres at not less than 10s. an acre, payable in 10 yearly instalments. If selections are made without residence in the southwestern division, double the amount must be paid. Selections may be made in New Zealand of not more than 620 acres of first-class, or 2000 acres of second-class land; the price varies from 5s. to 40s. an acre. Deferred payment is permitted at 25 per cent. advance on cash prices, and perpetual leases are granted for 30 years, with right of renewal for 21 years at a rental of 5 per cent. on the cash price. A bill has, however, been introduced into the New Zealand Parliament, which is designed to take away the right of purchase in perpetual lease. . . .

"Corn-growing is not as yet of the same value to the Australasian colonies as the breeding of sheep and cattle, but with the spread of irrigation it will probably increase. Wheat is principally cultivated in South Australia, Victoria, and New Zealand, oats in Victoria and New Zealand, barley in Victoria, and maize in

New South Wales and Queensland. The value of agricultural produce throughout Australia in 1890-91 is estimated at £76,000,000. Within recent years irrigation colonies, on the model of those established successfully in Southern California, have been formed at Mildura in Victoria and Denmark in South Australia, for the purpose of fruit-growing. The land is granted to cultivators in blocks of one square mile and upwards, and the colony, as a whole, shares in the expenses of the irrigation works, which fertilize the whole domain. Upward of 90 miles of main irrigation have already been constructed, with 120 miles of subsidiary channels, and some 6000 or 7000 acres of fruit orchards planted. The results already achieved after four years of existence are remarkable, and it is proposed to found an agricultural and horticultural college to promote improved methods of culture. Wages paid to agricultural labourers in Victoria for 1890 averaged 22s. 1d. a week for ploughmen, 11s. 11d. for female servants, 10s. 9d. for farm labourers, 3s. 6d. for mowers, 25s. 8d. for married couples, and 30s. 4d. for reapers. In all these cases rations were also given; threshers and hop-pickers, who are paid by the bushel, do not receive rations, and get 9d. and 3d. a bushel respectively. In 1891 these wages had decreased from 1 to 3 per cent., except in the case of married couples and dairymaids, whose wages showed a small increase.

"The importance of the pastoral industry is shown by the fact that there are in Australia and New Zealand 116,037,360 sheep and 10,953,551 cattle, whilst the capital invested in the industry amounts to £300,000,000. About 50,000 persons are employed in ordinary pastoral labour, whilst in the shearing season this number is doubled. The total amount of wool produced in New Zealand and Australia in 1889 was 535,435,633 lbs., worth £21,887,754—viz., 49,500,000 lbs. more than in 1888. In 1890-91, 618,052 bales of wool were exported from Australia, 83 per cent. of which were shipped to London. Nevertheless, the profits of the industry have greatly diminished in recent years, and the governments of the different colonies are endeavouring to let their land in smaller areas and to encourage the growth of food-stuffs and the rearing of cattle. This diminution in the profits of pastoralists has been brought about in part by changes in the land laws. Settlers, who took up large areas when land was cheap, thinking that they would have the pre-emptive right to other large tracts, find that the loss of this right has diminished the value of their holdings. Indeed, station property is said to have decreased 50 per cent. in value during the last few years. Again, other settlers have suffered much loss from rabbits and muskittails, though one squatter spent £10,000 on wire netting, he lost his sheep through allowing one hill to remain unfenced. In 1890-91 the Victorian Government spent £37,000 in attempting to exterminate rabbits on the Crown lands."

CANADA.

The chief industry of Canada is agriculture; 45 per cent. of her people are engaged in agriculture. According to the census of 1891, the area of improved land in Canada was 28,537,242 acres, of which 10,904,826 were under crop. Only 10 per cent. of the land is yet under crop or pasture. The wheat crop of 1890 was 42,144,779 bush., of which 21,314,582 came from Ontario and 16,092,220 from Manitoba.

The live stock in 1891 was: Horses, 1,441,037; cattle, 4,060,662; sheep, 2,513,977; swine, 1,702,782. The export of wheat from Canada into the United Kingdom was in 1892, 10,668,284 bush., India sending 23,324,825 and the United States 12,317,977.

The timber wealth of Canada is very great. According to Government returns in 1891, it amounted to 4,942,462 cubic feet, besides railroad poles, ties, shingles, etc.

CAPE OF GOOD HOPE.

Up to December, 1891, 94,265,893 acres had been alienated, leaving 40,979,890 acres.

In the year ending March 31, 1891, the products were: Wheat, 2,727,490 bush.; oats, 1,810,130; barley, 923,065; Kafir corn, 1,387,710 bush.; 6,012,522 gals. of wine; 1,239,043 of brandy; 56,038,659 lbs. of wool; 6,823,660 of mohair; 3,228,004 of hides and skins, 2,801,398 of butter; 2,599,147 of raisins; 30,344,400 oranges.

(c) AUSTRIA-HUNGARY.

Austria-Hungary is an empire where such different forms of tenure and such different conditions obtain in various parts of the empire that general statistics are misleading. The revolution of 1848, abolishing the old feudal burdens on the land, practically transformed the small peasant farmers into independent proprietors, while the great proprietors, unprovided with capital to

hire farm hands, had to divide their large demesnes to a considerable extent into small holdings. The Report on Austria of the (English) Royal Commission on Labour says (p. 72):

"Large manorial landed estates, or *latifundia*, are chiefly found in Bohemia, which has been called 'the stronghold of the feudal aristocracy,' and in Galicia, Moravia, and Lower Austria. They are very rare in Carinthia and Salzburg, and in Dalmatia, where the large properties are chiefly in the hands of the merchant or capitalist class, they are practically unknown. Adopting the division of Professor von Inama Sternegg, who estimates as large landed proprietors (*Grossgrundbesitzer*) all who pay a yearly land tax of at least 1000 florins within one administrative area, the following table may be drawn up to illustrate the distribution of these great estates in the various provinces of the Empire:

Distribution of Large Landed Estates in Austria.

TERRITORIES.	No. of large Landed Estates.	Percentage of Total Number of large Landed Estates in Austria.	Percentage of Land Taxation.
Lower Austria.....	194	10.7	11.97
Upper Austria.....	36	2.0	7.20
Salzburg.....	5	0.3	0.90
Styria.....	50	2.6	6.49
Carinthia.....	14	0.8	1.81
Carniola.....	7	0.4	1.71
Coast Lands.....	23	1.3	1.81
Tyrol and Vorarlberg	10	0.6	3.29
Bohemia.....	678	37.6	30.83
Moravia.....	247	13.7	14.82
Silesia.....	60	3.8	2.19
Galicia.....	440	24.4	14.85
Bukowina.....	25	1.4	1.27
Dalmatia.....	7	0.4	0.86
Total.....	1,805	100.0	100.0

The large landed proprietors of Austria form one of the main electoral groups in Austria's at present (1895) very limited suffrage, a condition which is bitterly attacked by the Socialists. In Hungary, according to an official statement of 1893, quoted in *The Statesman's Year Book*, the ownership of land was as follows:

OWNERSHIP.	Acres.	Percentage of total Area.
State.....	3,963,391	5.68
Foundation.....	353,991	.51
Railways.....	59,704	.10
Fideicommiss.....	3,342,597	4.79
Districts and parishes.....	12,338,930	17.60
Companies.....	617,615	.89
Church.....	3,229,257	4.63
Educational.....	189,145	.27
Private.....	45,631,549	65.44
Total.....	69,726,170	100.00

According to a statement of 1888, the size of properties in Hungary and the number of proprietors was:

	Number.	Total Area Acres.
Under 43 acres	2,348,107	21,489,900
43 — 286 "	118,081	9,639,600
286 — 1,439 "	13,757	20,363,200
1,439 — 14,300 "	4,695	9,523,800
Over 14,300 "	231	5,619,900

According to the *Oesterr. Stat. Handbuch* (1892, pp.

126-127), the average area devoted in Austria for 10 years (1881-90) was as follows:

Wheat.....	1,109,421
Rye.....	1,976,950
Barley.....	1,096,057
Oats.....	1,833,128
Maize.....	360,921
Leguminous produce.....	267,248
Potatoes.....	1,063,598
Vines.....	224,451
Beet-root (for sugar).....	204,541
Grass and clover for hay.....	3,938,943

Concerning the general condition of the agricultural population in Austria the Report of the (English) Royal Commission on Labour says (pp. 74-75):

"It appears that the agrarian question is, not without reason, a matter for serious anxiety in Austria. The decay of peasant proprietorship (*Bauernstand*) is especially regretted by politicians and economists. In 1881, in a single district (*Bezirk*) in Styria, no fewer than 700 small farms were put up for sale, and in one commune (*Gemeinde*) the peasant proprietors had diminished by 33 within a very few years. Large numbers of peasant holdings have been bought up by the great land-owners, by corporate associations (*Genossenschaften*), or, as has been particularly the case in Galicia, by the Jews. 'Large estates,' says Dr. Michael Hainisch, referring specially to the Alpine districts, 'accumulated in a few hands, the free peasant proprietor (*Bauer*) leaves the home of his fathers, which falls to a dependant tenant farmer (*Meier*) unless the new possessor prefers to turn the fields into forest. . . . One hears everywhere of the distress of the small farmer, seldom of his prosperity.' At a general meeting of peasant proprietors, which was held at Wiener-Neustadt in March, 1892, a small farmer from Pottendorf (Lower Austria) described the position of his class in strong terms. 'Things cannot go on,' he said, 'as they are. We are no longer able to bear the burden of taxation. Our families live on potatoes and dumplings (*Knodel*), and meat is only seen upon our tables once a year.'"

"Where the small independent farmer is not actually driven from the land by the pressure of competition and the burden of land taxation, which is said to fall comparatively more heavily on the small than on the large landed proprietors, he is often forced to sink into the position of a tenant, or to see his estate broken up into small holdings. The old patriarchal system, in which master and man 'ate at the same board,' and shared the same hearth, still prevails in the Alpine districts, but has almost disappeared elsewhere, more especially in Bohemia and Moravia. Custom is everywhere giving place to competition. Dr. Hainisch is of opinion that except in the neighbourhood of the towns, where intensive farming brings in rich returns, or in those mountainous regions where the homesteads are large enough to make cattle-farming profitable, the peasant farm in Austria is destined either to be absorbed by the large landed estate or to be broken up into a number of small holdings (*Parcelles*). As education and the means of communication spread, many peasant proprietors will, he thinks, voluntarily exchange their immediate interest in the land for trade investments, or for tenant-farming under a landlord, while many others will sink into the position of day labourers, and those who remain on their estates will lose their conservative character, and adopt new methods and ideas. A recent writer in the *Sozialpolitisches Centralblatt* also states that 'the very conditions of existence (*Existenzbedingungen*) of the smaller land proprietors seem to be threatened, and thereby one of the strongest supports of the whole constitutional system (*Staatswesen*) to be shaken.'"

"The condition of the agricultural day labourer is also far from satisfactory. Writing in 1872, Dr. Krafft stated that at that time this class, at least in Bohemia, was chiefly recruited from the ranks of the cotters (*Häusler*), market-gardeners (*Gärtler*), and landless workmen (*Miethsleute*). Their wages were very low, while prices were so high that they were forced to live on water gruel, potato soup, bread, and dumplings."

The report also gives the following table of daily wages for agricultural laborers in 1891 as taken from official calculations:

TERRITORIES.	Without Board.	With Board.
	<i>Kreutzer.</i>	<i>Kreutzer.</i>
Lower Austria.....	121	66
Upper Austria.....	101	54
Salzburg.....	102.5	53.5

TERRITORIES.	Without Board.	With Board.
	<i>Kreutzer.</i>	<i>Kreutzer.</i>
Styria.....	86	46
Carinthia.....	87	40
Carniola.....	82	52
Coast Lands.....	88	50
Tyrol and Vorarlberg.....	100	67
Bohemia.....	72	63
Moravia.....	58	34
Silesia.....	66	34.5
Galicia.....	59	29
Bukowina.....	58.7	36.5
Dalmatia.....	122	66

(d) BELGIUM.

Belgium is a land of very small holdings. In 1846 there were 572,550 holdings; in 1880, 910,396. In size they were:

Less than 1 hectare.....	594,376
From 1 to 5 hectares.....	226,088
" 5 to 10 ".....	48,390
" 10 to 20 ".....	25,893
" 20 to 50 ".....	12,186
Above 50.....	3,403

Hectare = 2.47 acres.

In 1880, 713,019 hectares were worked by owners, 1,270,512 by farmers.

The main crops are wheat, oats, rye, potatoes. Agricultural statistics are at present collected by the Government only once in every 10 years, and the most recent which have as yet been published are those for the year 1880. At that date the total number of men and woman engaged in agriculture throughout the kingdom was 1,199,319, or 21.77 per cent. of the whole population of the country; 44.02 per cent. of the persons employed were women.

(e) DENMARK.

There is much subdivision of the soil in Denmark. The law is such as to prevent the formation of large estates out of small ones, while it is favorable to the division of land. The tenant has by law complete control of the land he rents.

Twenty per cent. of the area of Denmark is unproductive, and of this about one sixth is peat bogs. Six per cent. of the productive area is forest, and of the remainder more than one half is pasture and meadow land.

The area under the different crops is divided as follows: Corn, 3,029,404 acres; potatoes, 128,849 acres; clover, 456,385 acres. In 1891 the principal crops were: Oats, 33,050,265 bush.; barley, 22,571,447 bush.; potatoes, 13,913,122 bush.; rye, 18,677,262 bush.

The value of the crops in 1891 was 355,214 kroner. Live stock in Denmark in 1888 were in numbers as follows: 1,459,527 head of cattle, 375,533 horses, 1,225,106 sheep, 770,785 swine. In 1892 Denmark exported 108,988 head of cattle, 11,578 horses, and 185,844 swine.

The total production of brandy in Denmark in 1892 was 7,435,388 gals.

(f) FRANCE.

Agriculture in France, according to the most recent statistics (census of 1886), employs 17,693,402 persons. Of the total area (52,857,199 hectares), 36,977,003 hectares are under crops, fallow, and grasses; 8,397,131 are forests; 6,086,678 are devoted to wheat; 3,812,852 to oats; 1,541,836 to rye; 1,512,136 to potatoes; 1,792,876 to vines; 1,120,764 to clover; 5,228,680 to pasture.

According to the *Annuaire de l'Economie Publique* for 1894, edited by Maurice Block, the wheat crop was 97,023,075 hectolitres; the rye was 22,802,805 hectolitres; wine was produced of a superior quality, valued at 149,518,000 frs., and of the ordinary quality at 1,107,009,000 frs. Silk culture is carried on in 24 departments, employing 141,500 persons.

The land is divided into small holdings. According to *La Grande Encyclopedie*, vol. xvii., p. 1006, the number of land holdings in 1891 was about 14,000,000, owned by about 8,000,000 persons, of which about 5,000,000 own agricultural holdings.

According to official report for 1882, the agricultural holdings were as follows:

Proportion of the whole agricultural area.		
From 1.5 hectares.....	1,866	11
" 5.10 "	769	12
" 10.20 "	431	13
" 20.30 "	198	10
" 30.40 "	98	7
Over .40 "	142	45
Total.....	3,504	98

The small holdings are mainly in the departments of the Seine, the Rhone, Belfort, the North, Puy-de-Dôme, Haute-Garonne, Gard.

(g) GERMANY.

Of the area of Germany, 94 per cent. is classed as productive and only 6 per cent. as unproductive. The acres given to the principal crops in 1892 were as follows: Wheat, 4,879,860; barley, 4,174,537; oats, 9,849,666; rye, 14,026,470. In 1891 there were raised 18,558,379 tons of potatoes, 18,715,112 of hay, 9,488,002 of beet-root (sugar), 743,462 gals. of wine. In 1882 the total number of agricultural inclosures of all kinds, each cultivated by one household, was as follows:

Under 1 Hectare.	Between 1 and 10 Hectares.	Between 10 and 100 Hectares.	Above 100 Hectares.	Total.
2,323,316	2,274,096	653,941	24,991	5,276,344

These farms supported 18,840,818 persons, of whom 8,120,518 were actually working upon them.

The system of land tenure and the condition of agricultural population is very different in different portions of the empire. In Prussia complete free trade in land exists. Of the various portions of the empire the report on Germany of the (English) Royal Commission on Labour says:

"In Westphalia and Oldenburg the agricultural labourer rents a small plot of ground from his employer on condition of giving him a certain number of days' work in return for a lower rate of wages than would otherwise be paid in the district. The labourer (*Huerling*) is a small cultivator on his own account, not as a rule rich enough to possess a team of horses, but allowed the use of his employer's team when necessary, and receiving other assistance in kind. The relations between the two parties are reported to be more favourable than in any other part of Germany; the employer is secure of a sufficient amount of labour, and the labourer in most cases contrives to amass considerable savings. Many families remain for centuries upon the same farms, and although their holdings are only on short leases, renewable at will, they come to regard them as their own property. Many of them add to their income by home industries, such as weaving, and occasionally, when there is little for them to do at home, they cross the border into Holland for a few months and work for wages.

"In Southern Germany the same system of small holdings prevails, but here the labourer is himself a small freeholder, who ekes out the scanty resources of his own property by performing service for the farmers (*Bauer*) with more land than they can cultivate themselves. This becomes the more necessary, because on the death of the small freeholder any land which he has accumulated does not pass intact to his appointed heir, as in Westphalia. It is, as a rule, subdivided amongst his children, who must recommence the laborious process of saving, if they are ever to be in a position of independence.

"Mid-Germany—*i.e.*, the district between the Weser and Elbe, is the home of the different classes of peasant farmers (*Bauer*), and of what are known as free labourers (*freie Landarbeiter*). These are drawn from different classes of the village population, possessing larger or smaller plots of land held on different systems of tenure handed down from feudal times, and known as Kötter, Brinksitzer, Häusler, or Anbauer. To the larger farmer (*Bauer*), or to the large landed proprietor (*Gutsbesitzer*), they are all merely day-labourers in the strictest sense of the term.

"In the wide expanse of territory east of the Elbe the contract between the agricultural labourer and his employer takes a great variety of forms; but in what Professor Knapp calls the most typical districts, where great estates (*Rittergüter*) are numerous and settle-

ments of peasant farmers (*Bauernhörfer*) few, the most usual form has hitherto been that known as socage-tenancy (*Instenwesen*). Here 'the landowner enters into a contract for a lengthened period, which assures him of the services not of an individual merely, but of a family. The family is settled in a cottage upon the landlord's estate, and must be prepared to provide a man and an assistant—a so-called socager (*Scharwerker*)—to perform the agricultural labour required upon the estate. A very small daily wage is paid in return; the socage tenant generally receives a portion of garden ground for his own use in addition to his house, and a few acres of land are cultivated for him within the estate; whatever these produce, whether corn, other kinds of produce, or potatoes, belongs to the socage tenant (*Inste*). Finally, the socage tenant has a right to thresh his landlord's corn during the winter in return for a certain proportion of the yield.' This remuneration in kind is often more than he can use, but he is at liberty to sell it, and the proceeds, together with a very small daily wage, represent the extent of his pecuniary resources. As a rule he owns a cow or a few sheep, and in all cases he keeps one or two pigs. As far as health and good nourishment are concerned the condition of such a labourer leaves little to be desired, and lately much has been done to remedy the miserable character of the cottages."

Forestry in Germany is an industry of great importance, conducted under the care of the State on scientific methods. About 34,347,000 acres, or 25.7 per cent. of the area of the empire, were estimated to be occupied by forests in 1889. In South and Central Germany from 30 to 38 per cent. of the surface is covered with forests; and in parts of Prussia 20 per cent. From forests and domains alone Prussia receives revenue of about 4,000,000 sterling.

(h) ITALY.

Of the total area of Italy, 86.9 per cent. is considered productive. In 1892 11,188,048 acres were given to wheat, 773,485 to barley, 1,112,532 to oats, 354,774 to rye.

Silk culture, though flourishing most extensively in Piedmont and Lombardy, is carried on all over Italy. In 1892 there were 537,869 persons employed in rearing silk-worms, and 175,000 skilled and other workers (including 120,386 women and 36,586 children) were employed in the treatment and manufacture of silk.

In the census of December 31, 1881, there were 5,024,836 males of 15 years of age and upwards described as engaged in agriculture. The entire agricultural population, male and female, of 15 years of age and upwards, was thus about 10,000,000. According to last census, the number of persons of 15 years of age and upwards was to the whole population in the ratio of 698 to 1000; thus the whole agricultural population was computed to be 14,000,000.

Concerning the general condition of the agricultural population the report on Italy of the (English) Royal Commission on Labour says (abridged):

"Agriculture has been called 'the backbone of Italy.' Very few parts of the civilized world, indeed, have a more distinctly agricultural character than this country, where 'the rural labourers may be counted by millions, while the industrial operatives are only numbered by thousands.' Great as is the importance of the agricultural question, however, it is extremely difficult to grasp, owing to the extraordinary complexity and variety of the conditions of Italian land tenure. It includes the mediæval manor (*latifondo*), cultivated on the most primitive extensive system, the most perfect system of intensive cultivation on a large scale; 'petite culture' pushed to the extreme of specialisation, and the same methods applied to the most heterogeneous mixture of products; rents varying from 5 lire to 2000 lire per hectare; peasant proprietorship, 'metayer' farming, feudal tenancies, and hired labour. In every separate district the phenomena of rural economy have special, exclusive, characteristic features, arising from an infinite diversity of local circumstances.

"The net income of agricultural Italy is rather over 1,000,000,000 lire. Its direct taxes amount to 300,000,000, exclusive of the tax on salt, of the income tax (*ricchezza mobile*), of the tax on cattle levied in many communes, of the indirect taxes, and, according to Sir D. Colnaghi, of 'the house tax,' which with the local surtaxes amounts to about 139,000,000 lire.

"There are three typical forms of agrarian contract in Italy—the 'metayer' system (*mezzadria*, *mezzeria*, *colonia*), in which the principle of profit-sharing finds its simplest expression; the leasehold system (*affitto*), and the system of home cultivation by means of hired labourers (*salario*). Each of these systems has given

rise to innumerable deviations in practice, and each passes by insensible gradations into the other. Many agriculturists cultivate part of their land as metayers, part as leaseholders, and part as the farm servants of a landlord.

"The 'metayer' system, according to the Italian Civil Code, is a contract by which the cultivator of a farm (*mezzaiulo*, *mezzadro*, *colono*) has the right to divide with the proprietor the produce of the farm (Art. 1647 of the Civil Code); the loss through accident of the whole or part of the harvest is borne in common by the proprietor and the metayer.

"The wages of day labourers and farm servants vary in the different provinces, and according to capacity and occupation, from about 150 lire to some 300 or 400 lire per annum, but the general question of wages is complicated by the prevalence of the custom of making payments in kind, or partly in kind and partly in money, while some kinds of work, as, for instance, ploughing, manuring, and mowing, are often paid by the piece. Signor Bodio gives the average daily wages of an adult agricultural labourer at about 2 lire in summer and about 1½ lire in winter. As during certain portions of the year outdoor labour is at a standstill, the average daily pay of an adult labourer during the whole year may be put at about 1 lire. Dairy-men get from 250 to 400 lire annually, with board; cow-herds receive from 15 to 90 lire per annum; and casual labourers can earn about 450 or 500 lire in the course of the year, though they sometimes almost double this sum by odd jobs, and not unfrequently by rural thefts, while owing to their frugal habits their real wages are fairly high. Women earn about half as much as men, but they are often able to eke out their scanty wages by spinning, plaiting straw, as in Tuscany, or working in the silk-reeling mills, as in Piedmont and Lombardy.

"Sicily, connected with the Italian kingdom, and yet separated from it, has special economic conditions complicated by the comparatively lawless state of society, and by the survival of ancient customs. The great stretches of treeless pasture land, cornfields, and fallows, which are found in the western provinces of the island, from Palermo to Girgenti, and from Trapani to Nicosia, are divided into large semi-feudal estates or fiefs (*latifondi ex-feudi*) held by the descendants of the old nobility, or by rich *bourgeois* families. Most of these estates range from 500 to 1000 hectares in extent, but there are some 2000 or even 6000 hectares. On each fief there is a manor house (*casamento*), usually in a state of dilapidation. The proprietors generally let the land for a money rent to rich manufacturers, for terms of years varying from three to six, or nine. These leaseholders, who are called *gabellotti* or *arbitranti*, sometimes rent several properties, which they in turn sublet to other tenants. Somewhat primitive methods of cultivation prevail, and a fourfold rotation of fallow, wheat, barley, and pasture, which recalls mediæval systems of agriculture, is commonly observed. The peasants (*villani*) usually contract to plough and sow the lords' fields.

"Turning now to the conditions under which the labouring classes in Sicily live, it appears that as a rule they are still very wretched and degraded. The day labourers are herded together in the towns in cottages, which are mere windowless hovels, where the common room is shared by the pigs and the poultry, and even occasionally by an ass or a mule. They have to go long distances each day to their work, and often, especially when they are engaged by the week, they do not return to their homes in the evening, but sleep in the farmyard in which they are employed, or camp out in the fields. They migrate also from the plains to the mountains, as the different crops ripen in succession. In times of difficulty they have recourse to money-lenders, who exact a high rate of interest from them."

(f) MEXICO.

Agriculture in Mexico is still in a very primitive condition. Provision is made for the sale and occupation of public lands by a law of 1863. From 1877 to 1892, 15,689,631 hectares had been adjudicated for agricultural purposes, under 6093 titles. The Government has introduced into Mexico 1,381,000 vines, 26,000 olive trees, etc. The chief agricultural products are maize, barley, wheat, beans. Other products are coffee, tobacco, cotton, sugar-cane, rice, cocoa, etc. Large numbers of cattle are exported to the United States.

(g) THE NETHERLANDS.

The principal divisions of the area of the Netherlands, according to the statistics of 1888, are as follows (in hectares, 1 hectare = 2.47 acres): cultivated land,

859,844; pasture land, 1,144,066; gardens and orchards, 54,124; forest, 226,068; uncultivated land (heath), 712,523.

The small estates are chiefly found in North Brabant, Guelders, Limburg, and Overysseel, while in South Holland, North Holland, Zealand, and Groningen large estates are more common. In 1891, 57.9 per cent. of all estates was held by the owners and 42.1 by the farmers. The estates in that year were in number as follows:

Above 100 Hectares.	From 75 to 100 Hectares.	From 40 to 75 Hectares.	From 20 to 40 Hectares.	From 10 to 20 Hectares.	From 5 to 10 Hectares.	Under 5 Hectares.
206	441	6,426	18,361	29,775	34,023	77,201

There were in the Netherlands in 1891, 271,900 horses; 1,532,100 cattle, 810,600 sheep, 987,900 swine.

(h) NORWAY.

Of the area of Norway, only 3 per cent. is under cultivation, 22 per cent. is forest, and 75 per cent. is considered unproductive. Most of the land is worked by owners in small holdings. In 1890, 10,478 acres were given to wheat, 122,040 to barley, 234,657 to oats.

(i) ROUMANIA.

The soil of Roumania is one of the most fertile in Europe, and the annual export of wheat, rye, maize, barley, rape-seed, pease, and wine is both large and increasing. The following table shows the chief cereals grown in 1882:

CEREALS.	Hectares of Cultivated Land.	Output in Tons.
Wheat	550,560	895,257
Rye	110,773	110,162
Barley	226,964	366,899
Oats	129,930	282,024
Maize	1,034,755	1,885,020

(m) RUSSIA.

In Russia, in 1892, according to official data, 410,801,867 acres belonged to the State, 373,310,406 to peasants, 294,504,582 to proprietors, and 19,890,835 to the imperial family; 210,058,770, largely belonging to the State, was unfit for culture. *The Statesman's Year Book* gives the following statement as to the Russian village communities. (See RUSSIA.)

The state of the redemption operation among the village communities of liberated serfs is seen from the following accounts up till October 1, 1893. The accounts are shown separately for Russia and the western provinces, where the conditions of redemption were more liberal for the peasants, according to the laws of 1863.

	Russia.	Western Provinces.
Number of male peasants who redeemed the land with State help	6,637,073	2,526,514
Number of acres redeemed	61,544,610	27,905,195
Value of the land, in roubles ...	703,645,091	185,572,593
Average price of the allotment.	106r. 0c.	64r. 50c.
Average size of allotment, in acres	9.4	10.0
Average price of the acre	11r. 40c.	6r. 50c.
Average former debt of the landowner to the State mortgage bank, per allotment	37r. 33c.	26r. 99c.
Average sum paid to the land-lord, per allotment	68r. 67c.	37r. 57c.

Moreover, 102,396 leaseholders redeemed their allotments (1,882,574 acres) for the sum of 21,243,401 roubles,

in South Russia and the western provinces, according to the laws of 1868-88, which recognize private ownership of land.

In 1892 the total land and that held in private ownership was as follows:

NATURE OF LAND.	Total.		In Private Ownership.	
	Acres.	Per cent.	Acres.	Per cent.
Arable.....	287,969,552	26.2	80,063,271	27.3
Orchards, meadow, grazing, etc.	174,958,734	15.9	68,628,269	23.2
Forests, etc.....	425,520,714	38.8	110,697,486	37.6
Unfit for culture, roads, etc.....	210,058,770	19.1	35,115,566	11.9
Total.....	1,098,507,780	100.00	294,504,582	100.00

From 1883 to 1887 in Russia in Europe, exclusive of Poland, an average of 28,882,440 acres were devoted to wheat, 12,442,950 to barley, 34,886,700 to oats, 64,611,810 to rye. In 1888 there were 19,633,340 horses, 24,609,260 horned cattle, 44,465,450 sheep. The North Caucasus is becoming more and more a granary for Russia, and the crops of 1892 in the three provinces of Kuban, Stavropol, and Terék were: Wheat, 7,654,800; rye, 1,185,200; barley, 2,333,000; oats, 2,054,300; various, 1,069,300; total, 15,206,600 quarters; potatoes, 714,600 quarters.

The amount of hay gathered in 1892 attained 30,000,000 tons in European Russia and 335,000 tons in Poland.

(n) SERVIA.

Servia, though yet in a backward state, raised in 1891 wheat valued at £1,780,200; maize, £1,272,900; rye, £388,800; barley, £345,216; oats, £226,592, besides large quantities of cattle, sheep, and pigs.

(o) SPAIN.

The productive area of Spain, reckoned at 70.65 per cent. of the whole, may be classed as follows: 1.6 per cent. olive culture, 3.7 vineyards, 19.7 grass, 20.8 fruits, 33.8 agriculture and gardens. The vine is the most important feature in agriculture, and the area under vines was in 1888, 5,000,000 acres, the total production of wine being 616,000,000 gals. Oranges, grapes, nuts, and olives are raised also in large quantities for export. The leading crops are wheat, rye, barley, maize, hemp, flax, and pulse.

The soil in Spain is greatly subdivided, and this subdivision has much increased of late years. In the year 1800 there were 273,760 proprietors, owning 677,520 farms, and there were 403,760 farmers. Now under the property tax the 3,426,083 assessments may be divided as follows:

Properties paying

From 1 to 10 Reales.	From 10 to 20 Reales.	From 20 to 40 Reales.	From 40 to 100 Reales.	From 100 to 200 Reales.	From 200 to 500 Reales.	From 500 to 10,000 Reales and upward.
624,920	511,666	642,377	788,184	416,546	165,202	279,188

(p) SWEDEN.

Only 8.1 per cent. of the area of Sweden is under cultivation, but the valuable forests cover 44.8 per cent., and the meadows 4.0 per cent. There are 328,646 cultivated farms, which may be classed as follows:

Farms of

2 Hectares and under.	2 to 20 Hectares.	20 to 100 Hectares.	100 Hectares and above.
70,652	210,586	32,280	3,129

In 1892 the value of all the cereal crops of Sweden was about 271,000,000.7 kronor.

In 1891 the area under the principal crops was as follows (in thousands of hectares): Wheat, 71.0; oats, 806.2; rye, 395.9; potatoes, 156.5. The yield of the principal products in 1892 was (in thousands of hectolitres): Oats, 24,472.2; rye, 9,306.1; barley, 5,015.3; wheat, 1,607.0; potatoes, 20,931.0.

In 1891 there were in Sweden 2,420,110 head of cattle, 1,345,337 sheep, 489,045 horses, and 655,373 swine. In 1891, 30,000 cattle and 27,000 sheep were exported.

(q) SWITZERLAND.

The Report on Switzerland to the (English) Royal Commission, affording the most recent information, says:

"The total area of Switzerland is 15,964 square miles, and of this nearly one fourth is unproductive. Of the remainder, 5,378,122 acres are under cultivation; the arable land covers an area of 1,533,093 acres, or 28.5 per cent. of the whole; 31.9 per cent. is meadow land (*Wiesen*), 36.5 per cent. pure pasturage (*Weiden*), vineyards cover 1.6 per cent., and gardens 1.5 per cent. of the total area. The number of persons employed in the various branches of agriculture is 1,168,137, or more than half of the total population. The most important branches of agriculture are cattle-breeding, grass and fodder growing, and the milk and cheese industries, but though these occupations form the chief support of the agricultural population, it is a rare thing to find a peasant family which subsists solely on the produce of the land. Industry and agriculture are very closely connected in Switzerland; 'the peasant when unoccupied by his land easily finds some useful employment in a multiplicity of other labours, varying from tree-felling and wood-carving to the manufacture of watch-springs. The artisan or factory-hand is, on the other hand, generally half a peasant, possessing some few square yards of land, with a cow or a few goats.'

"The Swiss system of land tenure, which is favourable to the formation of small freeholds, also contributes to the prosperity of the agricultural population. By far the greater part of the land is held in farms varying in size from 2 to 5 hectares, and in many industrial districts an innumerable quantity of minute holdings are to be found cultivated by members of the working class. The subdivision of property is in many districts carried to excess. This system is the foe to agricultural enterprise and one of the causes of the constant emigration from the pastoral districts. No Federal land code exists, but each canton possesses the power of framing its own laws relating to the tenure of land. In Aargau, Thurgau, and certain other cantons, therefore, the Government has passed laws fixing the limit to the subdivision of the land at a minimum ranging from 5000 to 20,000 square feet. The question of rent is an unimportant one in Switzerland, as it is rare to find a farm which is not worked by the owners; but owing to the continual subdivision of property the land is in many cases heavily mortgaged.

"The existence of large areas of common land (*Allmend*) in Switzerland is of great benefit to the agricultural classes. These lands are said to be a survival from the times when the whole soil of the country was held by the nation in common. The first departure from this custom was made by the Romans, who granted lands to veteran soldiers; gifts of land to religious foundations—to the Abbey of St. Gall, for example, in the eighth century—did still more to establish the principle of private property; but even as late as the thirteenth and fourteenth centuries by far the greater part of the soil of Switzerland was held in common. In 1803, under the influence of ideas which found expression in the French Revolution, the common lands were to a great extent sold by the communes to private persons. It was believed that private ownership would lead to better cultivation and to the eventual decrease of poverty, but the result showed that the step had led in most cantons to the increase of pauperism. The common lands now existing include (1) gardens, orchards, and vineyards, situated for the most part in valleys or on hill-sides; (2) pasture lands both in the lowlands and on mountains; (3) forests, where the inhabitants of the commune have the right of gathering firewood; (4) marshes, ponds, peat bogs, and the shores of lakes.

"Where farms are large enough to absorb more labour than the family of the owner can supply, they are cultivated by a staff of permanent labourers, who live with their employer and practically form part of his family. These labourers are engaged for long periods, and the best relations subsist between them and their employers. Day labourers, on the other hand, find themselves

in a very unstable position, as the demand for extra labour is not continuous, but confined to certain seasons of the year, such as the hay harvest. The wages of farm labourers are paid either entirely in cash or partly in cash and partly in food, etc. The money wage varies between 7 and 10 frs. a week, while the cost of maintenance probably amounts to from 90 cents to 1.25 per day. A non-contract labourer, working from 280 to 290 days a year, makes a daily average of from 2 frs. 50 c. to 3 frs. 50 c. The wages of boys and women may be reckoned at about 85 per cent. of the wages earned by adult males. Considerable differences are of course noticeable in different cantons: in Berne the average wages of male labourers are from 260 to 365 frs. a year, but good cowherds and stablemen are not to be had for less than from 400 to 600 frs. or even more. The average wages in Berne, Neuchâtel, and Vaud are 2 frs. 50 c. a day in winter, 3 frs. 50 c. in summer, and about 4 frs. during the harvest. The wages of contract labourers were formerly paid by the year; now, however, monthly or even weekly payments are more general, and the mobility of labour which this change implies does not contribute to the advantage of the farmer.

"The depressed state of agriculture has already caused considerable emigration from the rural districts; in 1866 the agricultural population of Zürich was estimated at 107,000 persons, including women and children; in 1870 this number had sunk to 104,000, and in 1880 further emigration had reduced it to 94,000. This state of things causes much uneasiness, and both the Cantonal and Federal governments have recently been called upon to determine the best means of fostering the agricultural interests of the country. In 1883 a Federal department of agriculture was established, and nearly every canton has framed laws which tend to the advancement of agriculture. During the years 1883-87 the grants made towards this object have been £12,120 per annum."

(r) TURKEY.

Of Turkey it is impossible to get exact statistics. The *Statesman's Year Book* says:

"Land in Turkey is held under four different forms of tenure—viz.: (1) as 'miri,' or Crown lands; (2) as 'vacouf,' or pious foundations; (3) as 'mulikaneh,' or Crown grants, and (4) as 'mülk,' or freehold property. The first description, the 'miri,' or Crown lands, which form the largest portion of the territory of the Sultan, are held direct from the Crown. The Government grants the right to cultivate an unoccupied tract on the payment of certain fees, but continues to exercise the rights of seigniorship over the land in question, as is implied in the condition that if the owner neglects to cultivate it for a period of three years it is forfeited to the Crown. The second form of tenure, the 'vacouf,' was instituted originally to provide for the religion of the State and the education of the people, by the erection of mosques and schools; but this object has been set aside or neglected for several generations, and the 'vacouf' lands have mostly been seized by Government officials. The third class of landed property, the 'mulikaneh,' was granted to the sphis, the old feudal troops, in recompense for the military service required of them, and is hereditary and exempt from tithes. The fourth form of tenure, the 'mülk,' or freehold property, does not exist to a great extent. Some house property in the towns and of the land in the neighbourhood of villages is 'mülk,' which the peasants purchase from time to time from the Government."

"Only a small proportion of arable land is under cultivation, owing principally to the want of roads and means of conveyance, which preclude the possibility of remunerative exportation."

"The system of levying a tithe on all produce leaves no inducement to the farmer to grow more than is required for his own use or in his immediate proximity. The agricultural development of the country is further crippled by custom dues for the exportation of produce from one province to another."

"The system of agriculture is most primitive. The soil for the most part is very fertile; the principal products are tobacco, cereals of all kinds, cotton, figs, nuts, almonds, grapes, olives, all varieties of fruits. Coffee, madder, opium, gums are largely exported. It is estimated that 44,000,000 acres of the empire in Europe and Asia are under cultivation. Since the ravages produced by the phylloxera in France, Turkish wines have been largely exported to that country; 20,308,521 litres in 1887-88, at an average cost of 31 francs the hectolitre. The forest laws of the empire are based on those of France, but restrictive regulations are not enforced, and the country is being rapidly

deprived of its timber. About 21,000,000 acres are under forest, of which 3,500,000 acres are in European Turkey. The culture of silkworms, which had fallen off considerably, owing to disease among the worms, is again becoming an important feature. The value of cocoons produced in 1892 was over £800,000, and of raw silk £1,200,000. The produce of 1893 was 20 per cent. superior. Most of the silk produced is exported, but some is used in the manufacturing of native dress material."

III. The Economics of Agriculture.

The importance of the part played in the social and industrial life of man by agriculture and by the persons actively engaged in or directly dependent upon agricultural employments it would be hard to overestimate. In the United States 44 per cent. of the population employed in gainful occupations are engaged in agriculture directly. Since 1820 the proportion of agricultural exports from the United States, compared with all its other exports, is as 78 to 22.

But this shows only its direct influence. Indirectly it influences all occupations. If 44 per cent. of our population are prosperous, it must affect the remaining 56 per cent. On the other hand, let the 44 per cent. engaged in agriculture be in distress, and it must affect every other class. This is not only because every man and woman and child in the country must consume the products of agriculture, but because the size of the farm population makes it the one great market for almost all manufactured articles which relate to the necessities of life, and because the agricultural element affects our politics and furnishes the great bulk of our materials of commerce. In every way it would be hard to overestimate the importance of this greatest industry of the world. It was not until the tribes of the world first commenced agriculture, and so gave up their nomadic habits and settled down in fixed homes, that civilization can be said to have really commenced. On the other hand, there is probably no occupation so affected by the varying social and political conditions of man as agriculture, because no occupation so depends for its life on settled habits, peaceful life, and general prosperity. Let war break out, and commerce and manufacture seem often aided; agriculture, however, suffers; men eat as much in time of peace as in war, and there are more to eat. Again, agricultural communities widely scattered over large areas are affected by politics and legislation, but are not so easily able to affect legislation.

As to what is needed for proper agricultural conditions political economists are still somewhat disagreed, tho the teaching of facts is now bringing the various schools somewhat together. Early political economy, especially among the Romans, had much to say about agriculture. (See POLITICAL ECONOMY.)

**Early
Economic
Ideas.**

Cato, Cicero, Seneca, Pliny, Varro, and Colomella treat agriculture in a half patronizing, half *dilettante* way, but yet give some good suggestions and teach the importance of all men having something to do with agriculture, and recommend small farms and free labor. It is a sad comment on their lack of earnestness that Rome fell largely on account of its large farms, tilled by slave labor.

The middle ages were too stormy to develop

much thought on agricultural lines, tho many of the monasteries and some of the noblest and greatest monks and bishops gave good examples of Christian cooperation and community life in the tilling of fields with their own hands and for the common good. (See MIDDLE AGES.)

But it is the school of the physiocrats (*q.v.*) in France, headed by Quesnay and Gournay, who have put the most importance upon agricultural production. With them

Physiocrats. agriculture (including mining, as, in a sense, the cultivation of the soil) is strictly the only industry that produces wealth. Commerce and manufacture, they held, only change the form and place of wealth. All taxes, therefore, they taught should be placed on land; hence they are the true progenitors of the single tax. Their doctrine, too, fell in with the tendency to revert to nature and simplicity, as taught by Rousseau and his "natural" school. Adam Smith brought thought back to more balanced views; but the rising industrialism, developed by the invention of machinery and steam power, drew men away from agriculture. There was a rush into industry, and agriculture was neglected. The land, in England especially, fell into the ownership of great land-owners, who leased their farms out, usually to tenants at will, and left the agricultural laborer somewhat more poorly paid and less cared for than the slave. Slaves cost money; laborers could be had for the asking. The chain-gang and the lash were common sights on English fields, and the homes of the English laborers were more rotten than slave pens. (See ARCH; KINGSLEY.) The more balanced views of Adam Smith were forgotten in carrying out his principle into the doctrinaire position of Ricardo and the orthodox school. Malthus' conclusions as to the law of population, that it was necessary that the poor perish, stilled England's conscience. To buy in the cheapest and to sell in the dearest market was considered a law of God. Labor was a commodity that must obey this "natural" law. The repeal of the Corn Laws marked an epoch in the development of agriculture and in the world.

Mill is the first writer to treat the agricultural question from both a moral and an economic basis, yet, in his economic teachings, as contrasted with his socialistic philosophizings, he scarcely departs from the orthodox position.

He compares the English system of large farms owned by lords (*la grande culture*) with the French, Flemish, and Rhenish systems of peasant proprietorship, or small farms owned and operated by peasants, and draws a strong argument in favor of the latter, saying, "Give a man the secure possession of a bleak rock, and he will turn it into a garden; give him a nine years' lease of a garden, and he will convert it into a desert." He shows also that small farms owned by their operators increase production, because more labor and more fertilizing are expended upon each farm than would be on the same land less divided. Following Mill, economic writers have taken one side or other of this question, either favoring *la grande culture* or peasant proprietorship, but, until very recently, for the most part conforming to the view

of Mill. *Metayage* (see METAYER), or the system of the peasant leasing and operating a farm on the condition of giving the landlord half of the produce—a system prevailing mainly in Italy and other southern European countries—has had some advocates, but not many.

Facts, however, are leading many minds today in another direction. It is being found that small farming does not pay. Mr. D. A. Wells says "that the only possible future for agriculture, "**La Grande Culture.**" prosecuted for the sake of producing the great staples of food, is to be found in large farms, worked with ample capital, especially in the form of machinery, and with labor organized somewhat after the factory system, is coming to be the opinion of many of the best authorities, both in the United States and Europe" (*Recent Economic Changes*, p. 460).

Mr. Wells adds in a note :

"An American practical farmer, the owner and manager of 7000 acres (Mr. H. H.—, of Nebraska), to whom the writer is indebted for many items of information, communicates the following additional review of this subject from the American (Western) standpoint: 'The average Western farm is now recklessly managed, but capital will come in greater volume and set up processes which will displace these wasteful methods. The revolution is certain, even if the exact steps cannot now be precisely indicated. At present the hay, and much of the grain, and nearly all of the tools and implements are unsheltered; and more than 50 per cent. of the hay is ruined for a like reason, while the animals themselves (I do not mean now on the wild-stock ranges, but even on the trans-Missouri farms) have no roof over their heads, except the canopy of heaven, with the mercury going occasionally 20° and even 30° below zero. These wasteful methods in farming are in part promoted by the United States Homestead law and the occupation of the hitherto inexhaustible expanse of cheap lands. When the ignorant, degraded, and impecunious can no longer acquire 160 acres upon which to employ their barbarous methods, and when the land already taken up shall have risen from the low prices at which it now stands to \$50 or more per acre, a new dispensation will arrive. Neither the cattle nor the food which the cattle consume will then be raised by any such methods as now prevail; neither will they be exposed to the elements in winter. True enough, the opening up of other virgin fields in Australia, South America, Africa, and elsewhere may retard this rise in the value of the land in the western part of our continent, and thus to a certain extent delay the passing of the land exclusively into the hands of larger capitalists and better managers; but it must be considered that not all climates are suitable for energetic, capable farming populations, and likewise that the best forage plants are restricted to temperate latitudes.'"

Already the process of displacing the small farms by large farms, operated by capitalistic labor, is far along in the United States. (See ART; FARMERS' MOVEMENT; MORTGAGES.) Says a writer in the *Fabian Essays* :

"Even agriculture, that one occupation in which old-fashioned individualism might be supposed safe, is being subjected to capitalism. The huge farms of Dakota and California, containing single fields of wheat miles long, are largely owned **Capitalism.** by joint stock corporations and cultivated exclusively by machinery. These huge farms, combined with the wheat 'corners' in New York and Chicago and the great railway corporations of America, have played havoc with many of the small farmers of the Mississippi valley, as the statistics respecting mortgaged farms will show. And when it is

remembered that the American farmer will be more and more obliged to meet the growing competition of the wheat of India, produced by the cheapest labor in the world, his prospect does not appear to be very bright."

Says Mr. Wells (*Recent Economic Changes*, p. 99):

"The following statements have recently been made in California, on what is claimed to be good authority (*Overland Monthly*), of the comparative cost of growing wheat in that State on ranches, or farms of different sizes. On ranches of 1000 acres the average cost is reported at 92½ cents per 100 lbs.; on 2000 acres, 85 cents; on 6000 acres, 75 cents; on 15,000 acres, 60 cents; on 30,000 acres, 50 cents; and on 50,000 acres, 40 cents. Accepting these estimates as correct, it follows that the inducements to grow wheat in California by agriculturists with limited capital and on a small scale are anything but encouraging."

It seems clear that the future will demand large farms carried on with the best machinery. Therefore many, fearing the development of "capitalistic" farming, advocate associated or cooperative farming on a large scale.

The idea is not a new one. In a sense it is as old as the beginnings of society. The primitive

form of land-holding and land-tilling was probably not communal, as

Cooperation. asserted by De Laveleye in his

Primitive Property, but rather paternal or patriarchal, and often

tyrannical—that is, the land was held by one chief or lord, and tilled for him by his vassals,

slaves, subjects, or whatever the relation may have been; nevertheless, it was associated agriculture, altho not democratic. Remnants of

this still appear in the Russian *mir*, the Javan *dessa*, the German *mark*, and in several communities like the *faults*, *Guitiards*, and *Gariotts* in Nivernais and Auvergne, and among the *massari* of Northern Italy. Recent experiments

in cooperative farming, like those of Mr. Guerdon, at Assington, in Suffolk, England, or the communal farming of the Shakers and other communities, especially that at Amaná, with its

25,000 acres, and property of over \$1,000,000 (see AMANA), show what can be done. For a full presentation, however, of cooperative farming, we must refer the reader to the article COOPERATIVE FARMS.

There are others who hold that the only way out is not through cooperative agriculture, but through agriculture under social-

ism. They argue that against capitalistic agriculture, with its great

Agriculture wealth and often with its secret

under "pull" upon the railroads, agricultural cooperators cannot succeed.

Socialism. The condition of the farmers, they say (see FARMERS' MOVEMENT), is for many of them too unfavorable to allow them to successfully cooperate. The only way out, they assert, is through the cooperation of the whole community, so as to do away with all competition. Till all industrial competition is removed, they argue that farmers cannot prosper. Perhaps the best brief presentation of agriculture under socialism is that of Mrs. Annie Besant, who says in the *Fabian Essays*:

"Then can begin the rural organization of labor on county farms, held by the County Councils. The Council will have its agricultural committee, charged with the administrative details; and this committee will choose well-trained, practical agriculturists as directors of the farm business. To the County Farm will be drafted from the unemployed in the towns the agricultural laborers who have wandered towardward in search of work, and many of the unskilled laborers. On these farms every advantage of machinery and every discovery in agricultural science should be utilized to the utmost. The crops should be carefully chosen with reference to soil and aspect—cereals, fruit, vegetables—and the culture adapted to the crop, the one aim being to obtain the largest amount of produce with the least expenditure of human labor.

"To these farms must also be sent some skilled laborers from among the unemployed—shoemakers, tailors, smiths, carpenters, etc.; so that the County Farm may be self-supporting as far as it can be without waste of productive power. All the small industries necessary in daily life should be carried on in it, and an industrial commune thus built up. The democracy might be trusted to ordain that an eight hours' day and a comfortable home should be part of the life-conditions on the County Farm. Probably each large farm would soon have its central store, with its adjacent railway station, in addition to the ordinary farm buildings; its public hall in the centre of the farm village to be used for lectures, concerts, and entertainments of all sorts; its public schools, elementary and technical; and soon, possibly from the outset, its public meal-room, saving time and trouble to housewives, and, while economizing fuel and food, giving a far greater choice and variety of dishes." (See SOCIALISM, *pro and con*.)

Still others hold that the only relief for agriculture lies in the adoption of the single tax.

Farmers to-day, it is asserted, are taxed indirectly on all they purchase, while the land is often of such little value that a tax equal to the full rental value would be a less tax than what directly or indirectly the farmer pays now, while the freeing of industry from its taxation and the concentration of all taxes on land would send such prosperity through the community as to give the farmers a ready market for abundant crops. (See SINGLE TAX, *pro and con*.)

The
Single
Tax.

ALBRECHT, an early German communist and so-called "prophet," who with Weitling (*g.v.*) spread through Germany the gospel of communism. Imprisoned for his utterances six years, he had as his only reading the Bible, and left the prison and escaped to Switzerland in 1841, thenceforward to devote himself to preaching, often in Old Testament prophetic language, the gospel of Bible communism. He wrote numerous tracts, among others: *Die Wiederherstellung des Reiches Zion* (*The Restoration of the Kingdom of Zion*); *Das baldige Wiedersehen am Alter der Frei-*

heit ; Herausforderung der Priesterwelt, etc.

ALDEN, PERCY. See UNIVERSITY SETTLEMENTS.

ALIENS, AND ALIEN AND SEDITION LAWS.—I. Alien. A person born in or belonging to another country who has not acquired citizenship. In the United States and England children born and remaining within the country, tho born of alien parents, are generally considered citizens ; and the children of citizens or subjects, tho born in other countries, are deemed natural-born citizens.

II. Alien and Seditious Laws were laws adopted by the United States Government in 1798, during a controversy with France. The second and most famous of them (1 Stat. 570) conferred power on the President to order out of the country such aliens as he might judge dangerous to its peace. It expired by limitation in two years, tho at the time the subject created such excitement as to lead to the overthrow of the Federal Party.

ALLAN, WILLIAM, born of Scotch parents in Ulster, Ireland, in 1813, died in 1874. Upon his father's removing to Glasgow, William became a piecer in a cotton factory there, and later was apprenticed to an engineering firm in that city. In 1835 he began working as a journeyman engineer at Liverpool. He became the general secretary of his union in 1847, and retained this office even after the society was merged in the Amalgamated Society of Engineers, being annually elected secretary for more than 20 years. William Allan was the originator of the "new unionism" of his time. He was remarkable for executive ability, and built up out of the fragments of organization in the engineering trade a great national society.

ALMSHOUSE.—A house appropriated for the use of the poor who are supported by the public or by a revenue derived from private endowments—a poorhouse. In the United States almshouses and poorhouses are synonymous, meaning only houses for the common residence of the publicly supported paupers of a town or county. In Great Britain almshouses are generally a number of small dwellings built together, supported by private endowment, for the use of respectable persons reduced to poverty, buildings for public paupers being called workhouses or poorhouses. The following is abridged from the chapter on *The Almshouse and its Inmates in American Charities* (1895), by A. G. Warner, Ph.D.

In 1880 there were 66,203 inmates of almshouses in the United States, or one almshouse pauper to 758 inhabitants ; in 1890 there were 73,025 almshouse inmates, or one to 857 inhabitants.* The decrease in proportion to population does not indicate a general diminution of pauperism, but merely that a historical development, already in progress, has been continued. When the work of relief is first begun by the newly formed political units of an American settlement, it is usual to board out such dependents as must be supported entirely. Farmers or others are paid to

care for old people, for imbeciles, and even for sick persons who have no homes of their own. Chiefly with a view to providing a place for the better care of the dependent sick, especially incurable cases, and also to economy, a public almshouse is established. During the first stage of its development it acts as the charitable catch-all for the community. Idiots, epileptics, incurables, incompetents, the aged, abandoned children, foundlings, women for confinement, and a considerable number of the insane, the blind, and the deaf and dumb are all dumped together into some old farmhouse that has been bought by the authorities, and put to this use.

In some populous cities the almshouses are still hardly more than enlarged specimens of this same type.

The next step is differentiation, removing first the deaf, dumb, and blind to special institutions. Next the insane are placed by themselves. It was early seen that a sure way to train up paupers was to rear children in almshouses. There was consequently much agitation and some **Inmates.** legislation to get children out of the almshouses, either into special institutions, public or private, or into suitable homes.

This differentiation of charitable work has left the old, the infirm, the decrepit, and the chronic invalids and paupers for the almshouse of the present time. A comparison of the figures of the Tenth Census with those of the Eleventh will show this change in progress, and indicate how far it has gone. The average age of almshouse paupers in 1880 was 45.1 years. In 1890 it was 51.03. The average age is lowest in the South Atlantic and the South Central divisions, where differentiation is least advanced, and highest in the Western division, where, as a rule, it is most advanced. In the far West one half of all the almshouse paupers are between 60 and 80 years of age.

Probably the completest picture of an American almshouse population ever presented was that set forth, statistically and otherwise, by the New York State Board of Charities in response to a legislative resolution passed in May, 1873. Regarding the 12,614 inmates, 422 were born in the almshouses, and 1650 were admitted when less than 10 years old. At the time of examination, nearly 13 per cent. were under 10 years of age, and almost exactly the same proportion was over 70. From the body of the report it is learned that 385 of the inmates had been in the almshouses less than one year, while 38 persons had been inmates more than 40 years. The average time of previous dependence for all inmates amounted to 4.88 years, not including time when they had been public charges in other institutions or as out-door paupers. This gives a total of 61,595 years of almshouse care for the benefit of the persons examined. Estimating the number of temperate and intemperate persons from those whose habits were ascertained, it was concluded that 84.36 per cent. of the males and 47.97 of the females over 16 years of age were intemperate. Among the insane the percentages were 79.21 and 21.44 respectively. Of the parents of the insane, reckoning, however, from a much smaller basis of exact information, it was estimated that 45.59 per cent. of the fathers and 17.72 per cent. of the mothers were intemperate. As to the prospects of the inmates some day becoming independent the following conclusions, based on a very careful study of each case, were reached :

	Number.	Percentage.
Permanently dependent.....	8,145	64.57
Will probably recover	1,116	8.85
May recover under proper training.....	1,379	10.93
Future doubtful.....	1,974	15.65

"In all the poorhouses were found at the time of examination more or less inmates whose ancestors were paupers, and who also had living or dead, other near pauper relatives. The information upon this subject was obtained with considerable fulness in the rural counties, where the history of pauper families was generally well known to the officers and others assisting in the examination. In the cities, however, but little could be learned bearing upon the subject."

The report further says that the popular impression that the almshouses of the State give shelter to persons who, through misfortune in business or otherwise, have fallen from high estate, is not borne out by the facts. But **Abuses.** few of the inmates had ever owned property to any extent. With few exceptions the mass of inmates owe their presence there to early idle and shiftless habits. In San Francisco, the jail, the hospital, and the almshouse is each, in turn, the resort of the typical inmate. They come to the lat-

* Bulletin, Eleventh Census, No. 90, p. 3.

ter to recuperate so long as any vitality remains, and finally return there to die, when completely wrecked by dissipation and irregular living. The women are much completer wrecks than the men, because prostitution gives the idle and vicious an alternative career until the last.

The disgrace that attaches to almshouse relief will not be lifted until differentiation has been carried a step farther, and there is some classification of inmates on the basis of character as disclosed in individual and family history. Reformatory institutions to which habitual drunkards, prostitutes, and other misdeameanants can be sent, and in which they must remain until reformation or death supervenes, would relieve the almshouse of many inmates, and the worthy poor of a very considerable portion of the disgrace which attaches to going there.

Among almshouse abuses may be enumerated dishonest or wasteful management of the funds; culpable stinginess on the part of the appropriating power, resulting in inadequate or unhealthful food, lack of proper buildings, heating apparatus, clothing, and so forth; insanitary conditions, including dirt and vermin; and finally, actual cruelty, resulting from either brutality or neglect on the part of the officials in charge. Few understand how easy it is for an official in charge of the utterly helpless to do cruel things without intentional cruelty. In the rural districts especially abuses are apt to arise because so few persons concern themselves with the institution. The superintendent has dreary work, small pay, and practically no general recognition of his services, whether they be good or bad. A sensitive, high-minded, ambitious man is not likely to apply for or accept such a place. The incumbent is, therefore, almost of necessity a tolerably stolid, unsympathetic person, and one who has not been very successful in other lines. The officials under whom he works send to him a miscellaneous assortment of the diseased, defective, and incapable, but do not give him the proper facilities for providing for these various classes. They cut his appropriations to the lowest possible point, and he fears that any vigorous protest would lose him the place. He therefore concludes that he may as well get along as best he can, since to object would only bring some more docile man into his place. On the other hand, most of the inmates with whom he has to deal are bad-tempered, unreasonable, and inveterately querulous. They would complain no matter what might be done for them; and he gradually acts on the unrecognized impression that it does not matter what is done for them—that anything is good enough for them. He becomes brutal unconsciously, and almost in self-defence. After a few years he does, without question, things that would have seemed absolutely awful to him when he first entered on his duties. There are also evils resulting from our American administration of almshouses even under competent officials. The first of these is the already referred to lack of classification: 1. The separation of the sexes. In small institutions their constant and complete separation involves practical difficulties, and occasionally a hideous condition of affairs is brought to light. 2. Classification by color, resulting in almost duplicate institutions. 3. Isolation of defectives. It is partly because this separation is so frequently out of the question that they ought not to be here huddled together. 4. Special provision for the sick. From one tenth to one half the inmates are often practically bedridden. A special ward for syphilitics is often necessary, even in small institutions. 5. Classification by age. This is especially necessary where there are children, but is usually not practised.

The second great evil which springs not from the character of the officials, but from the nature of our almshouse organization, is laxness regarding admission and discharge of inmates. Since every person is entitled to be saved from starvation and death from exposure, and as that is nearly all that the almshouse does for its beneficiaries, any one that will to claim its shelter can have it. On the other hand, as it is not a penal institution, and as it is to the interest of no one to have persons stay there who can support themselves outside, an inmate wishing to discharge himself is allowed to do so.

The results of this apparently defensible practice are thoroughly bad. Of the abuses to which it gives rise we may mention as first and least the support by the county of persons having pensions or property, or relatives able to support them. Secondly, it turns the almshouse into a temporary winter resort for tramps, or places where drunkards and prostitutes can recuperate between debauches.

The final and worst result of permitting the destitute to admit and discharge themselves at will is that it enables the dissolute and degenerate to have offspring "after their kind." The results are most manifest in the cases of feeble-minded women.

A third very prevalent evil in the management of American almshouses is lack of a work-test, and a failure to enforce proper discipline among the inmates.

In small rural communities an almshouse is sometimes self-supporting. This usually means that the county or town owns a farm of moderate size, and that a thoroughly good farmer has been employed as superintendent. As a rule, not more than 20 per cent. of the expenses of an almshouse can be defrayed by the work of the inmates. (See FAUPERISM; DEGENERATION; JUKES; PRISONS; CHARITY ORGANIZATION; TRAMPS, etc.)

Reference: The one complete book on the subject is *American Charities*, by A. G. Warner, Ph.D., from which our statement is abridged; see also reports, etc., especially the *Tenth Annual Report of the New York State Board of Charities*.

ALTGELD, JOHN P., Governor of Illinois (1895), was born in Prussia in 1848, and when a boy emigrated to the United States with his parents. His father settled on a farm near Mansfield, O. When the farm work was not pressing he attended the district school, but at the age of 16 enlisted in Company C, One Hundred and Sixty-third Ohio Infantry, and participated in the closing campaign of the Civil War. Returning home, he spent the next few years in teaching, studying, and working as a farm hand. Then he went to St. Louis, where he read law in a desultory way, and subsequently continued this in a law office at Savannah, Mo. His industry and faculty for getting to the heart of a subject soon brought him clients and prosperity. In 1874 he was elected prosecuting attorney of Andrew County, but in October of the succeeding year he resigned this office and removed to Chicago. Here he took little interest in politics for several years, but in 1884 accepted a nomination for Congress in an overwhelming Republican district, and was defeated, tho by a much reduced Republican majority. In 1886, without his solicitation, he was nominated for Superior Judge of Cook County, which at that time gave a Republican majority of about 12,000. He hesitated some time, but finally accepted, and his canvass and organization was so thorough that, notwithstanding defections from the Democratic Party and quarrels within its ranks, he was elected by a large majority, the laboring men being especially active in his interests. He was on the bench nearly five years, being Chief Justice of the Superior Court for one year. A multiplicity of private interests compelled him to resign this position in August, 1891. He has become quite wealthy, principally by the buying and selling of real estate in Chicago and investments in street railways. He designed and built a number of the finest business blocks in Chicago. He was nominated for Governor of Illinois on the first ballot in the Democratic convention of 1892, and made two efficient canvasses of the State—a preliminary one, in which he visited every county to ascertain its political condition and give instructions for organization, and another to address the people on the issues of the day. He was triumphantly elected, to the surprise of even his own party. For over 30 years Illinois had been considered safe for 25,000 to 50,000 Republican plurality. As a business man, he applies business principles to the dis-

charge of his official duties. He has recently gained the hostility of many of the wealthy classes through his pardoning, on June, 1893, of the so-called "Chicago anarchists," Neebe, Fielden, and Schwab. Governor Altgeld's ground for doing this was his belief that their trial had not been a fair one. (For a full account of Governor Altgeld's position in the matter, see CHICAGO ANARCHISTS.) Whether right or wrong, there is no question among those who know him that Governor Altgeld has acted in this matter from conscientious principles and contrary to his political interests. In the great Pullman strike of 1894 he publicly addressed President Cleveland, protesting against the Presidential policy of sending United States troops to keep the peace in Illinois when not requested to do so by the Governor, he believing that Illinois was abundantly able to protect its own citizens, and asserting that such action on the part of the Federal Government overrode the Constitution, and set up what might easily lead to a military absolutism. Governor Altgeld has written a book on penal machinery, pamphlets in favor of the 8-hour movement and similar problems, and a volume entitled *Live Questions* (1892).

ALTRUISM.—A term used in sociology and philosophy to denote the benevolent instincts and emotions in general, or action prompted by them; and more specifically used of that theory of life which would make the living for others the central thought of life and the essence of religion. It was first employed by Comte, but has passed into general use. Herbert Spencer says: "If we define *altruism* as being all action, which, in the normal course of things, benefits others instead of benefiting self, then from the dawn of life altruism has been no less essential than egoism." (See also INDIVIDUALISM and SOCIALISM.)

ALTRUIST COMMUNITY.—The Altruist Community was first organized in 1868, and established and incorporated as a benevolent society in Jasper County, Mo., where it remained about five years, having there 160 acres of land on payments, and an average membership of from 10 to 20 members. Not being able to complete its payments, its members were scattered for a time, until another place of 500 acres was bought on 10 years' time, in Dallas County, Mo., where it again had from 10 to 30 members, and again lost its place at the end of the 10 years. Still another place was found and paid for, of 120 acres, in Bollinger County, Mo., where it had from six to 12 members, and continued until 1887. This place was lost by a mortgage given to raise money to return investments of withdrawing members. In each place it had a different name, the first being the Reunion Community, the second the Friendship Community, and the third the Mutual Aid Community.

Since 1887 it has borne the name the Altruist Community, and has been located at 901 Olive Street, St. Louis, Mo., having at three different times six to eight adult members, both men and women, and a few children—there being one or two families and the others single persons. In 1894 still another place was offered in Arkansas, and the members accepted there with those

in the city numbered 10 in all, with about 12 more expected to come; but the place was found to be encumbered, and operations discontinued, which has left its members scattered and uncertain until sufficient means can be obtained to buy a place with permanent investments near St. Louis.

In the mean time the president of the community still holds the organization intact and (1895) publishes its monthly paper, *The Altruist*, and a book of 424 pages, containing a full exposition of its principles and organization. The community owns its own printing material and does all its own printing. It designs to continue its operations hereafter both in St. Louis and in the country near by.

AMALGAMATED ASSOCIATION OF IRON AND STEEL WORKERS.—This association was organized August 3, 1876, by representatives of previous organizations in the iron and steel industry—*viz.*, the Iron and Steel Roll Hands; the Associated Brotherhood of Iron and Steel Heaters, Rollers and Roughers; the United Sons of Vulcan, and the Nailers' Association. Of these there were respectively in the organizing convention 6, 15, 46, and 1. The first president and secretary was Joseph Bishop, with a salary of \$1500 for the first year, proving a most fortunate selection. The object of the association was set forth in a preamble closing with these words:

"We ask, is it charitable, is it humane, is it honest to take from the laborer, who is already fed, clothed, and lodged too poorly, a portion of his food and raiment, and deprive his family of the necessaries of life—by the common resort—a reduction of his wages? It must not be so. To rescue our trades from the condition into which they have fallen, and raise ourselves to that condition in society to which we, as mechanics, are justly entitled, and to place ourselves on a foundation sufficiently strong to secure us from further encroachments, and to elevate the moral, social, and intellectual condition of every iron and steel worker in the country, is the object of our national association, and to the consummation of so desirable an object we, the delegates in convention assembled, do pledge ourselves to unceasing effort."

Sec. 2 of the constitution stated that the objects of this association shall be to obtain by conciliation, or by other means that are fair and legal, a fair remuneration to the members for their labor; and to afford mutual protection to members against broken contracts, obnoxious rules, unlawful discharge, or other systems of injustice or oppression. The convention decided against arbitration by a majority of 50, because they preferred boards of conciliation (*q. v.*), but took strong ground against resort to strikes, if they could be possibly averted.

The first year was one of great success, and the convention that met in Columbus in 1877 was one of the best ever held in this country by workers in this trade. The next year was one of great depression in the trade. Prices kept going lower to October, 1878. Strikes began to multiply. These were not only against lowered wages, but against the "con-

History.

tract system," whereby a company kept back the first four weeks' wages and also 25 per cent. of the wages after that to the end of the year, then to be paid to the men, if profits would "justify such payment." As these were found, in the opinion of the company, rarely to do so, it naturally produced great opposition. The association has always been in favor of a high protective tariff, and did much up to this year to induce Congress to increase the duty on tin and tin-plate, to prevent old rails being admitted under existent duties, and to defeat the Wood tariff bill. In 1879 the trade began to revive and strikes to cease. The president's salary was reduced to \$1000, and he resigned, saying that if the men's wages had been reduced 33 1/2 per cent., they would all strike. John Jarrett was elected president January, 1880. The association grew rapidly; 43 new lodges were organized before August. The boom in the trade, however, soon ended. In four weeks, commencing April 8, prices fell from the highest point reached in the boom to the lowest—about 50 per cent. Strikes became prevalent, the majority ending in the defeat of the men, especially in the East. The West was more successful. The convention that met in Pittsburg August, 1880, was the largest yet held—192 delegates and officers being present. The next year was one of great trial. Strikes grew larger, ending in a general strike, which was totally defeated.

At the Cleveland convention in 1881 Canada was added to the jurisdiction of the national lodge, and colored men were made eligible to membership. This year the association was represented at the convention of the Federation of Labor in Pittsburg, but not after this, because of the striking out by the federation from its platform of resolution 11, which favored protection. The year 1882 was a critical one. Many strikes took place, including an important one at Homestead, which was practically successful. Severe jealousies broke out between the boilers and finishers. In December, 1882, the Bessemer steel-rail manufacturers proposed a cut in wages of 20 per cent., which the president, Mr. Jarrett, advised the members to accept. They refused, and the manufacturers made a cut of 33 1/2 per cent. The men struck, but after months were compelled to accept the 33 1/2 cut. In August, 1883, Mr. Jarrett resigned the presidency, to the universal regret, and William Weihe was elected. The next year was one of decadence. In 1885 the nailers withdrew from the association, but in 1886 rejoined it. In June, 1885, the association agreed to a reduction of 10 per cent. in all departments except that of the sheet mills. For the next three years strikes were few, and there are few events to be chronicled up to the great Homestead strike, which began on June 30, 1892. On account of the importance of this, we consider it in an article by itself. (See HOMESTEAD.)

The association is not a beneficial order. In case of disabled members, voluntary subscriptions are taken up, and sums of \$1000 to nearly \$3000 have been raised in this way. *The National Labor Tribune* has long been their organ. The Amalgamated Association has never advocated arbitration as a means of settling disputes or regulating wages. It is somewhat singular, too, to observe that though a strong sentiment in favor

of arbitration existed among the iron and steel workers up to the period of the organization of the Amalgamated Association, since then it has steadily been growing weaker, until at the present time the feeling is one of strong opposition. The association is, however, heartily in favor of conciliation. By conciliation is meant the right to settle or prevent labor differences by conferences between the parties interested, or their authorized representatives, these conferences having no power to reach a decision save as the result of mutual agreement. Arbitration provides for a third party. The association maintains that arbitration does not and cannot protect the workmen; because, in the first place, there is no fixed point that can be considered as fair profits to the employer; and secondly, no provision is made to fix a minimum of wages or prices, and consequently under free competition wages may go to the lowest point. As an illustration of this they point to the operation of arbitration among the iron-workers of the north of England, where prices of iron have become so low as to leave the wages of the workmen so meager that respectable living is out of the question. Under arbitration in England, the price of puddling is reduced to 6s. and 3d., or \$1.50 per ton, with the possibility that it may be yet further reduced; when with conciliation, in this country, the price of puddling is \$5 per ton, which is the minimum, based on a two cents manufacturers' card.

Conciliation Preferred to Arbitration.

The iron and steel workers have always preferred conciliation. The appointment of conference committees representing each side dates from January, 1865. The result of this—the first meeting of what many term the Conciliation Board—was the adoption of the following scale of prices:

MEMORANDUM OF AGREEMENT,

made this 13th day of February, 1865, between a committee of boilers and a committee from the iron manufacturers, appointed to fix a scale of prices to be paid for boiling pig iron, based on the manufacturers' card of prices, it being understood either party shall have the right and privilege to terminate this agreement by giving 90 days' notice to the other party, and that there shall be no deviation without such notice. When the manufacturers' card of prices is at the rate named below, the price for boiling shall be at the prices opposite, per ton of 2240 lbs.:

<i>Manufacturers.</i>	<i>Boilers.</i>
8 1/2 cents per lb.....	\$9.00
8 1/4 " " ".....	8-75
8 " " ".....	8-50
7 3/4 " " ".....	8-25
7 1/2 and 7 1/4 cents per lb.....	8.00
7 " 6 1/2 " " ".....	7-50
6 1/2 " 6 1/4 " " ".....	7.00
6 " 5 1/2 " " ".....	6-50
5 1/2 " 5 1/4 " " ".....	6.00
5 " 4 1/2 " " ".....	5-75
4 1/2 " 4 1/4 " " ".....	5-50
4 " 3 3/4 " " ".....	5.00
3 1/2 " 3 1/2 " " ".....	4-75
3 " 2 3/4 " " ".....	4-50
2 1/2 cents per lb.....	4.00

This was the adoption of the famous sliding scale of prices. It was hailed by all as an era of peace; but, as subsequent events showed, they were disappointed. Iron declined from 7 1/2 cents in February to 4 cents in July; and, as a consequence, the price for puddling declined in the proportion stipulated by the scale. Impressed with the belief that the basis of the scale was too low, the puddlers gave the required 90 days' notice in the summer of that year to terminate the agreement. At the expiration of the notice the price of iron had advanced slightly, giving the puddlers \$6.00 per ton, whereupon they demanded and received \$2.00 per ton of an advance, making the price \$8.00 per ton. The latter figure prevailed as the price for puddling from October, 1865, to October, 1866, when the puddlers, believing that the price of iron justified their action, demanded an advance of \$1.00 per ton, which was, with considerable reluctance, conceded by the manufacturers. About two months later the manufacturers gave evidence of an unwillingness to continue paying the prices, and finally served notice of a reduction of \$2.00 per ton. This the workmen promptly rejected, when a general lockout resulted in all the Pittsburg and adjacent mills. The lockout lasted from December, 1886, to May, 1867, when the employees gave in. And so it has gone with varying changes and conflicts and successes and failures, according to the history given above.

June 25, 1886, an agreement was entered into between the committee of the Manufacturers' Association and a committee of the Amalgamated Association. This scale of prices covers every possible detail of boiling, muck or puddle mill, bar and nail-plate mill, guide, 10-inch, hoop and cotton-tie mills, with its different departments of nut iron, channel iron, "T" iron, angles, clip, or wagon strap, hame iron, 10-inch mill, and hoop and cotton-tie mills; also plate and tank mills, sheet mills, Birmingham wire-gauge, and nail-cutting.

Notwithstanding the action in deciding not to affiliate with the Federation of Trades, the iron and steel workers are in hearty accord with all the great questions of the day, as advocated in the platform of the Federation, and the declaration of principles of the Knights of Labor. They are especially in favor of the compulsory education of children, and forbidding the employment of children under 15 years of age, and the reservation of the land for actual settlers. The only essential point of difference is on that of arbitration. The association attaches much importance to the question of temperance. It regards intemperance as a prolific source from which spring many of the evils which the workingman has to endure. Great care has always been taken to impress upon the minds of the members the necessity of properly husbanding their resources. It is not only necessary that the workmen should receive good wages, but also necessary that they judiciously spend them. In brief, the sole aim of the association is the social, moral, mental, and financial improvement of its members.

Among trade-unions the association has been marked for its reliance upon and support of protection. It has been thus, while one of the largest and wealthiest, one of the most conservative, and in many ways

the most progressive of trade-unions—a fact all the more noteworthy, considering the result of the last great Homestead strike. Since that strike its membership has diminished. Its membership to-day (June, 1895) is reported to be 34,000 in 290 unions, with J. C. Kilgallon, 108 Fourth Ave., Pittsburg, for secretary. See TRADE-UNIONS.

AMANA COMMUNITY.—A German religious community on the Iowa River, in Iowa, reached at the station of Homestead, on the Chicago and Rock Island Railroad. The community numbers some 2400 souls, owns about 25,000 acres, is rated at over \$1,000,000 in capital, and is in every way an economic and an industrial success. Mainly agricultural, it has herds of blooded cattle, sheep, hogs, and a large number of fine horses. It also does a growing manufacturing business. The two largest woolen mills in Iowa are owned and operated by the community. The famous colony blue prints are made here; 80 pieces of these, containing 45 yards each, are turned out in a day. The community has, moreover, two large flouring-mills, with full roller process and elevators, manufacturing pearl barley and hominy. There are also three large machine-shops, where most of the farm machinery used by the community is made. Besides these there are dye-shops, blacksmith-shops, sawmills, a printing-office, and other lesser industries. Their business is growing because their patrons are well treated. Their goods are all honest goods, the Amana brand telling its own story.

The community lives in eight villages, two or three miles apart, Amana being the center, and Homestead the most important railroad office.

Each village has its own doctor, school, post-office, store, hotel, and

Organization. place of meeting. The government of the community is vested in a president—now Dr. Jacob Witmer—and a board of 13 directors, elected by the community for life. Family life is preserved inviolate, each family living alone, except where two or three

prefer to live in the same house. They come together, however, for common meals in little boarding-houses, one for every four families. The fare is simple, but abundant and healthy. The houses are pleasant and homelike, tho unpainted, being covered in summer with vines and surrounded by little flower gardens. The communism is absolute, all the necessities of life being provided freely for all, and the industries being operated for the equal advantage of all. The life is simple and quiet, there being few amusements and little variety; national holidays and memorial days, however, are observed. The community is very religious. A prayer-meeting is held in each village every night of the week, where the men sit

Belief.

on one side and the women on the other, and quietly sing their German Lutheran chants, or pray, or read from the Bible or the books of their prophets or leaders. They call their communities True Inspiration Congregations, and believe in the Trinity, justification by faith, the resurrection of the dead, the gradual purification of the impenitent by fire, the communism of all saints as a necessary part of Christianity. They believe that an era of inspiration began in the eighteenth century, the Holy Ghost speaking to their founder, Erasmus Gruber, and other "prophets." They drink wine made by their own labor, formerly brewing the best beer of the State, and deriving quite a profit from this, which practice, however, they quietly ended when Iowa became a prohibition State, doing this out of respect to the law and the opinions of their neighbors. Wine, however, they give to their employees in harvest-time as freely and generously as to themselves. The life being so simple and quiet, and without great educational advantages, many of the young people leave, and are allowed to do so, but usually are glad to come back to the peace and quiet plenty of the communal home. They do not seek new members, but elect to membership those who come and after trial prove themselves of the right spirit. The universal language is German. The beginning

History.

of the sect was in Wurtemberg, Germany, where it was founded in 1714 by Erasmus Gruber. At his death Christian Metz became their leader, and he brought them to this country in 1843. First settling in Ebenezer, Erie County, N. Y., they moved to their present site in 1855-64.

AMENDMENTS TO THE CONSTITUTION.—Congress at its first session under the Constitution proposed to the States 12 articles of amendments. Of these 12 articles, 10 were ratified by the legislatures of three fourths of the States, and became part and parcel of the Constitution from December 15, 1791. These amendments constitute the first 10 of the amendments to the Constitution. They, in general, relate to the rights of the people and to limitations of government.

ART. I. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to as-

semble, and to petition the Government for a redress of grievances.

ART. II. A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

ART. III. No soldier shall in time of peace be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ART. IV. The right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ART. V. No person shall be held to answer for a capital or otherwise infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war or public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb, nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property without due process of law; nor shall private property be taken for public use without just compensation.

ART. VI. In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ART. VII. In suits at common law, where the value in controversy shall exceed \$20, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ART. VIII. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

ART. IX. The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ART. X. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

The eleventh amendment was proposed at the first session of the Third Congress, in 1794, and was declared adopted as a part of the Constitution January 8, 1798. It is as follows:

ART. XI. "The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign State."

The twelfth amendment was proposed at the first session of the Eighth Congress, in 1803, and was adopted by the requisite number of States the next year. At present there are three other amendments—the thirteenth, fourteenth, and fifteenth—all of which have grown out of the Civil War.

ART. XII. The electors shall meet in their respective States, and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted. The person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a

member or members from two thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President.

The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed, and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

ART. XIII. Sec. 1. "Neither Slavery nor involuntary servitude, except as a punishment for crime, whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction."

SEC. 2. "Congress shall have power to enforce this article by appropriate legislation."

This amendment was proposed by Congress in 1865 and ratified by the constitutional number of States the same year.

ART. XIV. Sec. 1. "All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws."

SEC. 2. "Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, including Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, representatives in Congress, the executive and judicial officers of a State, or the members of the legislature thereof, is denied to any of the male inhabitants of such State being 21 years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens 21 years of age in such State."

SEC. 3. "No person shall be a Senator or representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a vote of two thirds of each house, remove such disability."

SEC. 4. "The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void."

SEC. 5. "The Congress shall have power to enforce, by appropriate legislation, the provisions of this article."

This amendment was proposed by Congress in 1866, and was declared to be a part of the Constitution in July, 1868. It need not be further discussed here.

ART. XV., Sec. 1. "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude."

SEC. 2. "The Congress shall have power to enforce this article by appropriate legislation."

The object of this article was to secure suffrage to the colored race, especially to the freedmen of the South. It specifies three points in respect to which the right of citizens of the United States to vote shall not be denied or abridged, either by the National or State Governments:

1. On account of race.

- 2. On account of color.
 - 3. On account of previous condition of servitude.
- It was at first proposed to add two other points, nativity and religion, but these were stricken out before the proposed amendment was sanctioned by Congress. This amendment was proposed by Congress in 1869, and was declared to be ratified in 1870.

WILLIAM A. MOWRY.

(See his *Studies in Civil Government*.)

Concerning amendments to the Constitution, Professor Bryce says in his *American Commonwealth*, chap. xxxii.:

"There are therefore two methods of framing and proposing amendments.

Methods of Making Amendments. "(A) Congress may itself, by a two-thirds vote in each house, prepare and propose amendments.

"(B) The legislatures of two thirds of the States may require Congress to summon a Constitutional convention. Congress shall thereupon do so, having no option to refuse; and the convention when called shall draft and submit amendments. No provision is made as to the election and composition of the convention, matters which would therefore appear to be left to the discretion of Congress.

"There are also two methods of enacting amendments framed and proposed in either of the foregoing ways. It is left to Congress to prescribe one or other method as Congress may think fit.

"(X) The legislatures of three fourths of the States may ratify any amendments submitted to them.

"(Y) Conventions may be called in the several States, and three fourths of these conventions may ratify.

"On all the occasions on which the amending power has been exercised, method A has been employed for proposing and method X for ratifying—i.e., no drafting conventions of the whole Union or ratifying conventions in the several States have ever been summoned. The preference of the action of Congress and the State legislatures may be ascribed to the fact that it has never been desired to remodel the whole Constitution, but only to make changes or additions on special points. Moreover, the procedure by national and State conventions might be slower, and would involve controversy over the method of electing those bodies. The consent of the President is not required to a constitutional amendment. A two-thirds majority in Congress can override his veto of a bill, and at least that majority is needed to bring a constitutional amendment before the people.

"There is only one provision of the Constitution which cannot be changed by this process. It is that which secures to each and every State equal representation in one branch of the legislature. 'No State without its consent shall be deprived of its equal suffrage in the Senate' (Art. V.). . . . The amendments made by the above process (A+X) to the Constitution have been in all 15. . . .

"Many amendments to the Constitution have been at various times suggested to Congress by Presidents, or brought forward in Congress by members, but very few of these have ever obtained the requisite two-thirds vote of both houses. In 1780, however, and again in 1807, amendments were passed by Congress and submitted to the States for which the requisite majority of three fourths of the States was not obtained; and in February and March, 1861, an amendment forbidding the Constitution to be ever so amended as to authorize Congress to interfere with the 'domestic institutions,' including slavery, of any State, was passed in both houses, but never submitted to the States, because war broke out immediately afterward. It would doubtless, had peace been preserved, have failed to obtain the acceptance of three fourths of the States, and its effect could only have been to require those who might thereafter propose to amend the Constitution so as to deal with slavery, to propose also the repeal of this particular amendment itself. . . .

Attempts at Amendments. "Why, then, has the regular procedure for amendment proved in practice so hard to apply?

"Partly, of course, owing to the inherent disputatiousness and perversity (what the Americans call 'cussedness') of bodies of men. It is difficult to get two thirds of two assemblies (the houses of Congress) and three fourths of 38 commonwealths, each of which acts by two assemblies, for the State legislatures are all double-chambered, to agree to the same practical proposition.

Except under the pressure of urgent troubles, such as were those which preceded the acceptance of the Constitution itself in 1788, few persons or bodies will consent to forego objections of detail, perhaps in themselves reasonable, for the mere sake of agreeing to what others have accepted. They want to have what seems to themselves the very best, instead of a second best suggested by some one else. Now, bodies enjoying so much legal independence as do the legislatures of the States, far from being disposed to defer to Congress or to one another, are more jealous, more suspicious, more vain and opinionated, than so many individuals. Nothing but a violent party spirit, seeking either a common party object or individual gain to flow from party success, makes them work together.

"If an amendment comes to the legislatures recommended by the general voice of their party, they will be quick to adopt it. But in that case it will encounter the hostility of the opposite party, and parties are in most of the Northern States usually pretty evenly balanced. It is seldom that a two-thirds majority in either house of Congress can be secured on a party issue; and, of course, such majorities in both houses and a three-fourths majority of State legislatures on a party issue are still less probable. Now, in a country pervaded by the spirit of party, most questions either are at starting, or soon become, controversial. A change in the Constitution, however useful its ultimate consequences, is likely to be for the moment deemed more advantageous to one party than to the other, and this is enough to make the other party oppose it. Indeed, the mere fact that a proposal comes from one side rouses the suspicion of the other. There is always that dilemma of which England has so often felt the evil consequences. If a measure of reform is immediately pressing, it becomes matter of party contention, it excites temper and passion. If it is not pressing, neither party, having other and nearer aims, cares to take it up and push it through. In America, a party amendment to the Constitution can very seldom be carried. A non-party amendment falls into the category of those things which, because they are everybody's business, are the business of nobody.

"It is evident, when one considers the nature of a rigid or supreme constitution, that some method of altering it so as to make it conform to altered facts and ideas is indispensable. A European critic may remark that the American method has failed to answer the expectations formed of it. The belief, he will say, of its authors was that while nothing less than a pretty general agreement would justify alteration, that agreement would exist when obvious omissions preventing its smooth working were discovered. But this has not come to pass. There have been long and fierce controversies over the construction of several points in the Constitution, over the right of Congress to spend money on internal improvements, to charter a national bank, to impose a protective tariff—above all, over the treatment of slavery in the Territories. But the method of amendment was not applied to any of these questions, because no general agreement could be reached upon them, or indeed upon any but quite secondary matters. So the struggle over the interpretation of a document which it was found impossible to amend passed from the law courts to the battle-field. Americans reply to such criticisms by observing that the power of amending the Constitution is one which cannot prudently be employed to conclude current political controversies, that if it were so used no constitution could be either rigid or reasonably permanent, that some latitude of construction is desirable, and that in the above-mentioned cases amendments excluding absolutely one or other of the constructions contended for would either have tied down the legislature too tightly or have hastened a probably inevitable conflict."

(For a different view, however, see CONSTITUTIONALISM, also REFERENDUM.)

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE, THE, formed in Philadelphia, December 14, 1889, for the purpose of promoting the political and social sciences.

While it does not exclude any portion of the field indicated in its title, yet its chief object is the development of those aspects of the political and social sciences which are either entirely omitted from the programs of other societies,

Evils of the System.

or which do not at present receive the attention they deserve.

Among such subjects may be mentioned sociology, comparative constitutional and administrative law, philosophy of the State, and such portions of the field of politics, including finance and banking, as are not adequately cultivated by existing organizations.

A special effort is made to collect and publish material which will be of use to students, and which does not now reach the public in any systematic way, as, for example, the texts in English of the constitutions of leading foreign countries; regular accounts of current instruction in political and social topics at home and abroad; descriptive bibliographies; discussions of municipal government, etc.

The plan of the academy includes regular scientific meetings for the presentation of papers and communications, establishment of a library, and the dissemination of knowledge on political and social topics through its publications, and by such other means as may seem suitable.

The income of the academy at present is derived from the annual membership fee, which is \$5, the life-membership fee, which is \$100, and from the contributions of those who may be willing to assist in its work. It is desired to secure the establishment of prizes and fellowships.

Any one may become a member on being approved by the council and paying the annual or life-membership fee. Members are entitled to receive the regular publications of the academy, submit papers and communications, and to attend and take part in all scientific meetings. Life members are exempt from all annual fees. Its annual meeting is held in January.

The list of members now (1895) includes about 300, and the names of nearly all the prominent thinkers and writers on political, economic, and social topics in the United States and Canada, and many in Europe.

The proceedings of the academy are published in the form of a periodical called the *Annals of the American Academy of Political and Social Science*, which, together with such other matter as may be published for that purpose, is sent to all members of the academy free of charge.

The articles in the annals more important for permanent use are usually reprinted in separate editions and sold at low price. Over 160 have been reprinted in five years, such as Professor Gedding's *Province of Sociology*, Dr. J. S. Billings' *Public Health and Municipal Government*, Professor Common's *Proportional Representation*, G. K. Holmes' *A Decade of Mortgages*, Professor Patten's *The Theory of Social Forces*.

AMERICAN ECONOMIC ASSOCIATION.—This body was organized at Saratoga, September 9, 1885. The declared objects of the association are:

1. The encouragement of economic research, especially the historical and statistical study of the actual conditions of industrial life.

2. The publication of economic monographs.

3. The encouragement of perfect freedom of economic discussion. - The association, as such, will take no partisan attitude, nor will it commit its members to any position on practical economic questions.

4. The establishment of a bureau of information designed to aid members in their economic studies.

Any person may become a member of this association by paying \$3, and after the first year may continue a member by paying an annual fee of \$3. On payment of \$50 any person may become a life member, exempt from annual dues.

Each member is entitled to receive all reports and publications of the association.

The membership is now about 700, and is still growing. Valuable monographs have been published by the association since its start, and are still published six times a year, at \$4 per year. Prizes are also offered by the association for the best monographs on appointed subjects, and they have produced some of the best papers yet written on Child Labor, the Tenement Problem, etc. The association has annual meetings, usually in December, and standing committees on the following subjects:

1. On Labor.
2. On Transportation.
3. On Trade.
4. On Public Finance.
5. On Industrial and Technical Education.
6. On Exchange.
7. On General Questions of Economic Theory.
8. On Statistics.
9. On Teaching Political Economy.

Besides the above-mentioned monographs, the association has recently commenced issuing a series of somewhat more popular *Economic Studies*. The monographs are to appear at irregular intervals. The subjects for the studies are such as: The Relation of Changes in the Volume of the Currency to Prosperity; The Adjustment of Wages to Efficiency; The Populist Movement. Among the monographs are: *The Relation of the Modern Municipality to the Gas Supply*, by Professor E. J. James; *Relation of the State to Industrial Action*, by Professor H. C. Adams; *Socialism in England*, by Sidney Webb; *An Honest Dollar*, by President E. Benjamin Andrews; *Municipal Ownership of Gas in the United States*, by Professor E. W. Remis; *The Silver Situation in the United States*, by Professor F. W. Taussig; *The Housing of the Poor in American Cities*, by M. T. Reynolds.

AMERICAN FEDERATION OF LABOR, THE.—Originally organized in Baltimore, August 20, 1866. The trade assemblies of New York City and Baltimore had issued a call for a national congress of trade-unions, and over 100 delegates responded, representing 60 different organizations. The result was the formation of what was called the National Labor Union. Resolutions were passed in favor of the eight-hour day, labor journals, cooperative stores, agriculture in the South, improved artisans' dwellings, mechanics' institutes, against unpaid prison labor, deprecating strikes, advising the unemployed to go on public land, asserting that land should go to

the actual settler, pledging support to sewing women, etc. The resolution which was perhaps most significant of both the weakness and the strength of this union was one declaring against existing political parties, and for the organization

of an independent National Labor Party, the object of which should be

Origin. to secure the enactment of a law making eight hours a day's work.

On the political question the National Labor Union was, ere long, to go to pieces. The eight-hour policy was to become the distinctive policy of the Federation of Labor. The New York *Tribune* declared the convention to represent the intelligence, education, and enterprise of the working men of the Union.

Subsequent conventions were held at Chicago (1867), where 200 delegates were present; at Pittsburg (1868); New York (1868); Chicago (1869); Boston (1870); Philadelphia (1871), and Columbus (1872). At this convention the union undertook to nominate a candidate for the Presidency of the United States, an attempt which led to such discussions and dissensions, that, in connection with the financial crisis of 1873, the order was broken up. An important industrial congress, however, met at Rochester, N. Y., April 14, 1874, Robert Schilling presiding, and the congress adopted a Declaration of Principles drafted by George E. McNeill, which is of significance, as the Declaration was afterward adopted by the Knights of Labor (*q.v.*), which organization had been founded and was for a while to rival the Federation.

After the Columbus convention it was nine years, however, before any national federation of trade-unions was formed. But in 1881, 107 delegates, representing nearly 250,000 workers, met in convention in Pittsburg, Pa., and established the Federation of Organized Trade and Labor Unions of the United States and Canada, now known as the American Federation of Labor. A clear exposition of the general policy was made in a document read at the second convention of the Federation, held in Cleveland, O., on November 21, 1882. This document urged not political, but industrial unity as the prime object that the Federation should aim at—"not by prescribing a stereotyped, uniform plan of organization for all, regardless of their experience or necessities, nor by antagonizing or aiming to destroy existing organizations, but by preserving all that is integral in them and widening their scope, so that each, without submerging its individuality, may act with the others in all that concerns them. The benefit of this Federation was not only to render pecuniary and moral assistance in case of strikes or lockouts, but to lessen the number of these conflicts by causing unscrupulous employers to hesitate before declaring war on employees reinforced by such a body. A systematic plan of propaganda was inaugurated. Its aim was to place a check on the transportation of labor and to get an enactment by the workmen themselves that on a given day eight hours should constitute a day's work, and that they ought to enforce it themselves."

The Federation held from the start a distinctive policy from that of the Knights of Labor. Whereas the Knights strove to bring all working people not only into one order, but largely into one form of organization, and did not respect the autonomy of trade organizations, the Federation of Labor has always stood for allowing each trade to organize and control its craft in its own

way. It has always been literally a federation of trade-unions, and on this policy has steadily acted. For awhile, however, the Knights of Labor was the more popular organization, and sprang into rapid growth. The effort, however, to mould various trades and degrees of development into one form proved eventually the weakness of the order, and it has of late years gone rapidly down, while the Federation, with its wiser policy, has steadily grown in strength and in numbers. The difference of principle, however, between the two organizations, and unfortunate personal issues and jealousies that grew out of it, long retarded the development of organized labor. To-day, however, the policy of the Federation is almost everywhere triumphant, though the Knights still (1895) in certain sections and certain trades have considerable strength.

The third convention was held in New York City on August 21, 1883. At this convention the Legislative Committee was instructed to present a bill to Congress creating a National Department of Labor; and a committee was also appointed to confer with the Knights of Labor with a view to the unification and consolidation of all labor efforts. This attempt has been made almost every year since, but never with success.

History.

The fourth convention was held in Chicago, Ill., on October 7, 1884, when steps were taken for a general propaganda in behalf of the eight-hour system, and May 1, 1886, was fixed upon as the date of the general inauguration. It will be remembered, however, that the Anarchists at Chicago took advantage of this movement to rouse the people with their incendiary ideas, and that on May 5, 1886, the bomb was thrown at Haymarket Square, Chicago. This act very much hindered the legitimate work of organized labor. Nevertheless, some unions succeeded at this time in gaining the eight-hour day.

The fifth convention was held in Washington on December 8, 1885, and was marked by measures which were taken to prevent the abuse of the boycott, the usefulness of which had become impaired by unscrupulous persons and rival factions, who resorted to that legitimate and powerful weapon upon every frivolous, trivial, or imaginary grievance, and was often levied upon goods of firms that employed none but union workmen and paid the highest rate of wages in their line of manufactures.

The sixth convention was held in Columbus, O., on December 8, 1886. This convention had been originally called to meet in St. Louis, but the necessity of taking defensive measures against the unwarranted aggressions upon trade-unions, in some instances even denying them the right of existence, and a considerable accession to the ranks of the Federation resulting therefrom, led to considerable modifications. At this convention 25 affiliated national organizations were represented, with an aggregate membership of 316,469 workmen; a more perfect plan of organization was adopted and the title changed to the American Federation of Labor.

The next annual convention was held in Baltimore, Md., on December, 1887. The roll of this convention exhibited 58 delegates, representing 40 national and international unions and central organizations. Including the local trade-unions having no national head and the "federal labor unions" affiliated with the American Federation of Labor, but, for economic reasons, not sending delegates, this convention represented 242 unions or branches, and a total membership of 600,340 members in good standing.

The third convention of the American Federation of Labor, but the eighth consecutive annual gathering of the representatives of the trade and labor unions of America, was held in St. Louis, Mo., on December 11, 12, 13, 14, and 15, 1888. The proceedings, which were marked by the greatest unanimity and enthusiasm, will be held memorable by the adoption of a resolution fixing the date for the general inauguration of the eight-hour work-day at May 1, 1890. Looking to this end, it was decided to call simultaneous mass-meetings in all cities of the country on four important national holidays—*viz.*, Washington's Birthday, February 22, 1889; Independence Day, July 4, 1889; Labor Day, 1889, and Washington's Birthday, 1890.

The ninth convention was held in Boston, Mass., December 10-14, 1889. Among the important measures adopted were to extend an invitation to the labor organizations of the world to attend an International Labor Congress at Chicago during the World's Fair; resolutions of thanks to European working men for their cordial indorsement of the proposed inauguration of the eight-hour work-day, and steps to further such cooperation; indorsement of the Australian system of ballot reform; the employers' liability law, and the rejection of a resolution looking to "the formation of a political labor party." The Executive Council were empowered to select such trade as they might deem best for the concentration of effort to secure the adoption of the eight-hour work-day on May 1. The plan was for all unions of some one trade to strike on May 1 for the eight-hour day, while all other trades were to support them. The next year some other trade was to strike, and all other trades to support it. As is well known, The United Brotherhood of Carpenters and Joiners of America were selected to strike the first year, and the movement was successful in 137 cities, and benefited 46,197 workmen of that trade. In some other cities it was partly successful, and in others not at all. At least much was gained and agitation very much increased.

The tenth annual convention was held in Detroit, Mich., on December 8, 1890, and remained in session six days; 103 delegates were present, representing 83 organizations. Since the previous convention 282 charters had been issued, and the national trade-unions reported having established 913 branches in the same time; these also reported 1163 strikes, of which number 939 were successful, 76 lost, and 98 compromised. All reported an increase of wages from 7 to 25 per cent., except one, which was owing to dullness of trade. The action of the Executive Council in selecting the miners as the next trade to move toward eight hours was concurred in.

The action of the convention producing the most interest, for the time being, and occupying a large share of time, was that of again defining the attitude of the American Federation of Labor toward political parties seeking affiliations. A charter had been refused to the Central Labor Federation of New York City upon the ground that among the list of bodies attached to that body

Political Attitude.

was the name of the American Section of the Socialist Labor Party. After protracted debates said action was indorsed by a large majority. In taking this step it was clearly understood that the character of the party did not enter into the question any more than if they had been Prohibitionists, the Farmers' Alliance, or a mixed Local Assembly of the Knights of Labor, all of whom make similar claims of seeking solely the economic welfare of the toiler. It was a reaffirmation of the traditional policy since organization to restrict their united efforts solely to industrial ends without doing aught to awaken either political or religious dissensions among their diversified membership, and the necessity of confining membership in a Federation of "Trade and Labor Unions" to such only.

It was distinctly declared by the supporters of the position that they opposed neither socialism nor independent political action, but simply the introduction of politics into the Federation. Nevertheless, since this vote the leaders of the Federation and supporters of the position have been denounced by the socialists as reactionary and traitors to the cause of labor.

The strike of the miners on May 1, owing to strongly unfavorable conditions in their industry, was only very partial and accomplished little more than the agitation of the idea.

The eleventh annual convention was held in Birmingham, Ala., the first time in the history of the general labor movement that one of its conventions has met in the South. The influences were vastly beneficial to organization in that section of the country. At this convention it was resolved to test the constitutionality of the conspiracy laws and the rights of the courts to issue writs of injunction on wage-workers charged with no offense against the law, but engaged in a contest with their employers. An investigation of the "sweating" system and the abolition of this social crime were demanded at the hands of Congress. Renewed pledges to attain the eight-hour work-day were made and action taken for its enforcement. Protests against convict labor coming in competition with free labor were entered. Selection of organizer for woman's labor was authorized. The abolition of child labor was demanded. Counter propositions to the Knights of Labor were made, which if accepted would avoid disputes between the two organizations.

The twelfth annual convention was held at Philadelphia, Pa., December 12-17, 1892; 67 organizations were represented. Since the previous convention 277 charters had been issued. Strong ground was taken as regards the restriction of undesirable immigrants. It was unanimously resolved to adhere to the plan of operations that had been followed in the past—organization of trade-unions. President Gompers in his opening address said: "We should rather be a *unit in our demands* than a political party." A resolution in favor of Government ownership of all telegraph and telephone systems was adopted. Protests were made against Sunday labor and convict labor. It was agreed to memorialize Congress in order to secure a law providing protection to the trade-marks and labels of organized labor. Direct legislation—initiative and referendum—was indorsed. Strong resolutions were passed concerning the Homestead strike.

The convention was marked by a strong spirit of patriotic feeling at a meeting in Liberty Hall, coupled with a sense that the Federation was battling to-day for liberty as truly imperiled as 100 years before.

The thirteenth convention met in Chicago December, 1893. Perhaps the most important subject before the convention was the following resolution, which was introduced, discussed, and referred to the various unions. to be voted on during the year:

Whereas, the trade-unionists of Great Britain have, by the light of experience and the logic of progress, adopted the principle of independent labor politics as an auxiliary to their economic action; and

Whereas, such action has resulted in the most gratifying success; and

Whereas, such independent labor politics are based upon the following program, to wit:

1. Compulsory education.
2. Direct legislation.
3. A legal eight-hour work day.
4. Sanitary inspection of workshop, mine, and home.
5. Liability of employers for injury to health, body, or life.
6. The abolition of the contract system in all public work.
7. The abolition of the sweating system.
8. The municipal ownership of street-cars, and gas and electric plants for public distribution of light, heat, and power.
9. The nationalization of telegraphs, telephones, railroads, and mines.
10. The collective ownership by the people of all means of production and distribution.
11. The principle of the referendum in all legislation.

Therefore, *Resolved*, that this convention hereby indorses this political action of our British comrades; and

Resolved, that this programme and basis of a political labor movement be, and is hereby, submitted for the consideration of the labor organizations of America, with the request that their delegates to the next annual convention of the American Federation of Labor be instructed on this most important subject.

The fourteenth annual convention met in Denver December, 1894. At this convention the above resolutions were discussed and the first nine adopted with little discussion, and with substantial unanimity and with substantially no change. Plank 11 was incorporated with plank 2, making that plank read: "Direct legislation through the initiative and referendum." Plank 3 was made to read "a legal work-day of not more than eight hours." In Plank 8 the words "water-works" were substituted after the words "street cars." The great discussion came on plank 10. After a long debate it was defeated, and three resolutions substituted for it, as follows: (1) The abolition of the monopoly system of land-holding and the substitution therefor of a title of occupancy and use only (carried by a vote of 1217 to 913). (2) The repeal of all conspiracy and penal laws affecting seamen and other workmen, incorporated in the Federal and State laws of the United States. (3) The abolition of the monopoly privilege of issuing money and substituting therefor a system of direct issuance to and by the people. The socialists, however, who favored plank 10 held that it had only been defeated by delegates disobeying their instructions, and so on the vote to adopt the resolutions as a whole they voted no, and the vote was lost by 1173 to 735, the socialists hoping that next year (1896) they may carry the plank.

The convention also adopted a resolution demanding the re-enactment of the Silver Coinage Law of 1893 upon a ratio of 16 to 1. The committee on the president's address reported, indorsing the position of the executive council in the American Railway Union strike, and.

recommending the fixing of May 1, 1896, as the date for an effort to establish the eight-hour day.

Mr. Samuel Gompers, who had been for many years the capable president of the Federation, was defeated, and Mr. John McBride, the head of the Miners' Union, elected in his place. At the meeting in New York, however (December, 1895), the Federation reelected Mr. Gompers and voted to confine its main attention to the eight-hour movement.

December, 1893, the following national trade-unions were represented in the American Federation; the first figure representing the number of local unions in the trade, the second the total membership: Bakers, 120—13,300; barbers, 82—1800; blacksmiths, 19—1500; boiler-makers, 32—9000; bookkeepers, 15—1100; box-makers, 22—900; brewers, 75—11,000; bottle-blowers, 61—7000; bricklayers, 230—33,500; brass-workers, 33—4000; carpenters, 824—65,700; cigar-makers, 329—27,500; carriage-makers, 15—1800; coopers, 36—2600; clerks, 81—3200; coal-miners, 260—21,000; conductors, 255—8000; cloak-makers, 10—2500; electrical-workers, 46—5200; engineers (locomotive), 420—30,500; (stationary), 130—6400; firemen, 472—24,000; furniture-workers, 41—6500; furriers, 7—1200; garment-workers, 44—7500; glass employees, 4—800; glass-workers, 117—8100; grinders, 18—1400; granite-cutters, 133—1700; haters, 25—5800; harness-makers, 22—1500; horse-collar-makers, 26—2800; horseshoers, 289; members; iron-molders, 278—26,000; iron and cornice-workers, 68—2500; iron and steel-workers, 340—45,000; knife-makers, 6—500; laborers, 54—9500; machinists, 154—10,900; musicians, 58—10,500; pattern-makers, 34—6000; painters and decorators, 201—15,000; piano-makers, 46—5500; plasterers, 83—13,000; plumbers, 36—6500; polishers, 26—1100; printers, 359—32,300; quarrymen, 26—2400; railway employees, 33—16,500; seamen, 16—3500; shoe-lastors, 76—10,500; shoemakers, 61—7500; silk-workers, 12—1000; spinners, 14—10,200; stone-cutters, 14—1500; switchmen, 120—6500; trainmen, 486—24,000; tack-makers, 6—450; tailors, 220—18,500; tanners, 9—800; telegraphers, 74—3500; textile-workers, 18—8000; tile-fayers, 10—3000; waiters, 23—1900; weavers, 5—350; woodworkers, 5—300; watch-case engravers, 5—300; wood-carvers, 600 members.

Statistics.

This represents a total of 7037 local unions and an aggregate membership of 652,300. This list does not include 1500 local unions affiliated with the American Federation, and several thousand other unaffiliated local unions, all of which have no national head. A few of these unions are not yet formally affiliated with the Federation of Labor, yet all are united by virtue of a common polity.

At present, owing to the hard times, the number standing as paid upon the books of the Federation is probably somewhat less, but the real strength of the Federation is undoubtedly greater than in 1893. During 1894 charters were given to five new national unions and 167 local unions, while \$22,493.78 were received.

The constitution of the American Federation of Labor, in its features of general interest, is as follows :

PREAMBLE.

Whereas, a struggle is going on in all the nations of the civilized world, between the oppressors and the oppressed of all countries, a struggle between the capitalist and the laborer, which grows in intensity from year to year, and will work disastrous results to the toiling millions if they are not combined for mutual protection and benefit;

It therefore behooves the representatives of the trades and labor unions of America, in convention assembled, to adopt such measures and disseminate such principles among the mechanics and laborers of our country as will permanently unite them to secure the recognition of the rights to which they are justly entitled.

We therefore declare ourselves in favor of the formation of a thorough federation, embracing every trade and labor organization in America, organized under the trade-union system.

CONSTITUTION.

ARTICLE I.—Name.

This association shall be known as the American Federation of Labor, and shall consist of such trade and labor unions as shall conform to its rules and regulations.

ARTICLE II.—Objects.

SEC. 1. The objects of this Federation shall be the encouragement and formation of local trade and labor unions and the closer federation of such societies through the organization of central trade and labor unions in every city, and the further combination of such bodies into State, Territorial, or Provincial organizations, to secure legislation in the interest of the working masses.

SEC. 2. The establishment of national and international trade-unions, based upon a strict recognition of the autonomy of each trade, and the promotion and advancement of such bodies.

SEC. 3. An American federation of all national and international trade-unions, to aid and assist each other; and, furthermore, to secure national legislation in the interest of the working people, and influence public opinion, by peaceful and legal methods, in favor of organized labor.

SEC. 4. To aid and encourage the labor press of America.

ARTICLE III.—Convention.

SEC. 1. The convention of the Federation shall meet annually at 10 A.M., on the second Monday in December, at such place as the delegates have selected at the preceding convention.

ARTICLE IX.—Revenue.

SEC. 1. The revenue of the Federation shall be derived as follows: From international and national trade-unions a per capita tax of one fourth of one cent per member per month; from local trade-unions and federal unions, one cent per member per month; and from central labor unions of city and State federated bodies, \$25 per annum. All moneys shall be payable to the secretary of the Federation.

ARTICLE X.—Miscellaneous.

SEC. 3. Any seven wage workers of one trade of good character, and favorable to trade-unions, and not members of any body affiliated with this Federation, who will subscribe to this constitution, shall have the power to form a local body, to be known as a Federal Labor Union, and they shall hold regular meetings for the purpose of strengthening and advancing the trades-union movement, and shall have the power to make their own rules in conformity with this constitution, and shall be granted a local certificate by the president of this Federation, provided the request for a certificate be indorsed by the nearest local or national trades-union officials connected with this Federation.

The Federation publishes a monthly, *The American Federationist*, at 50 cents a month, and considerable tract literature. For all information address the secretary (1895), Aug. McCraith, De Soto Block, Indianapolis, Ind. (See TRADE-UNIONS.)

AMERICAN FORESTRY ASSOCIATION.—The American Forestry Association (formerly Congress), composed of delegates from all the States, meets annually. The twelfth annual meeting was held at Washington, D.C., December, 1893. J. D. W. French, Boston, Mass. (1895), is corresponding secretary. Local or State associations have been formed in Colorado, Ohio, New York, Pennsylvania, Kentucky, Minnesota, Texas, South Carolina, North Dakota, Wisconsin, and New Jersey. (See FORESTRY.)

AMERICAN INSTITUTE OF CHRISTIAN SOCIOLOGY, THE.—Founded at Chautauqua July 20, 1893. The objects of the society, as stated in the constitution, are :

1. To claim for the Christian law the ultimate authority to rule social practice.

2. To study in common how to apply the principles of Christianity to the social and economic difficulties of the present time.

3. To present Christ as the living Master and King of men, and His kingdom as the complete ideal of human society to be realized on earth.

The institute is interdenominational, and aims to carry out its objects by publications, by lectures and addresses, by the establishment of libraries, professorships, etc., and especially by the formation of local institutes following prescribed courses of study. It holds at least one general meeting in each year, thus far in Chautauqua. There have been also institutes of the society held at Grinnell, Ia., Oberlin, O., and other places, largely under the guidance of Professor George D. Herron (*q.v.*), of Iowa College, Grinnell, Ia.

AMERICAN INSTITUTE OF CIVICS.

—Organized in 1885. The purposes of this institution, briefly stated, are to promote everywhere and through all practicable agencies, including home influences, educational institutions, the press and the platform, the integrity, intelligence, patriotism, and vigilance, which are essential to the common weal under the rule of the people. The membership includes councilors in every State, whose high character, commanding influence, and subordination of selfish considerations to the public good qualify them for the high service in which the institute seeks to enlist them. The president of the institute (1895) is Henry Randall Waite, Ph. D.

Control is vested in 33 trustees, chosen for periods of one, two, and three years, who elect their own successors. Provision is made for a faculty, an advisory body, composed of members specially qualified for assistance in the formation of plans. The immediate supervision of its affairs is intrusted to its president and the executive committee of the board of trustees. It has corresponding members of its faculty in a majority of colleges, a corps of 230 lecturers, and the co-operation of a steadily growing body of councilors, composed of citizens of the highest character in all parts of the country, chosen with a view to their willingness and ability to render useful service unitedly or as individuals.

The work of the institute is carried on in several departments, as follows :

I. EXTENSION DEPARTMENT.

Department of Popular Work.

The chief purpose of this department is to secure the cooperation, in efforts to promote good citizenship, of suitable organizations, of either adults or youths, in cities, villages, and rural communities. The institute seeks to bring such organizations, already existing or effected for the purpose, into relation with itself as auxiliaries, and to interest them in provisions for the intelligent consideration of current events and all questions vitally related to good government, the maintenance of law and order, and the welfare of society. An important feature of the department is its corps of lecturers, numbering upward of 225 citizens, all exceptionally qualified for useful service, through the delivery of addresses before lyceums, secular and religious associations of young people, teachers' institutes and other educational assemblies, religious meetings, students in colleges and public schools,

working men's societies, law and order societies, municipal leagues, good government clubs, and other civic associations, and especially before the various organizations related to the institute as auxiliaries.

II. DEPARTMENT OF EDUCATIONAL INSTITUTIONS.

This department has recently been formed by the consolidation of the departments of Public School Work, of College and Professional School Work, and of Business Schools. It is devoted to the promotion, in cooperation with the officers and teachers of schools and colleges, of such instruction as shall most fully qualify American youth for the discharge of civic obligations.

III. DEPARTMENT OF THE PRESS.

Through this department the institute seeks to disseminate information as to its purposes, to enlist the cooperation of daily, weekly, and other publications and writers for the press; and also to present to the members and the public generally, through its official organ, the *American Journal of Politics*, the best thought of the day upon public questions, a record of the progress of efforts for political and social advancement, and other valuable information.

IV. DEPARTMENT OF LEGISLATION.

Civil Service and Law Reform.

In cooperation with members in the several States, it is sought, through this department, to promote legislation calculated to secure the proper administration of public affairs, to protect and elevate the suffrage, and to give, in all the States, such form to laws affecting the social order as shall make them uniform, just, and effective in their operation.

The institute has also established a department of Christian Citizenship, through which it seeks to promote activities as the result of which the ideas and obligations representative of Christianity may be made more largely contributory to the betterment of civic and social conditions. Professor Lawrence Phelps, principal of the Berkeley Temple of Applied Christianity, Boston, and Professor Daniel Fulcomer, of the University of Chicago, are associated in the direction of this department. It will seek to promote local conferences of Christian citizens for the discussion of the best means of giving greater power and usefulness to Christian citizenship; and will also seek to establish Christian citizenship classes in connection with Young Men's Christian Associations, Societies of Christian Endeavor, and similar organizations. The institute is represented by the *American Magazine of Civics* (formerly *American Journal of Politics*), a monthly publication of 125 pages, which is its official organ. Its membership has extended until it has a sufficient nucleus for organized and efficient work in some 600 of the more important centers of influence throughout the country.

AMERICAN PARTY.—The name chosen by three political parties at different periods in

United States history. I. In 1852, when the Whig Party was breaking up, a secret organization had been formed, said to have been called the Sons of '76, or the Order of the Star Spangled Banner. Any member on being asked about the society was made to answer, "I don't know;" hence the society was called the society of Know Nothings. It carefully avoided the subject of slavery, and tried to draw attention from that subject by confining itself to vigorous opposition to Catholics and aliens. Its first principle was "Americans must rule America." In February, 1856, it held a convention, called itself the American Party, and nominated Millard Fillmore for President, and Andrew Jackson Donelson for Vice-President—nominations which were indorsed by the Whig convention in September. Fillmore, however, carried but one State, Maryland, while his total vote was about 850,000. In 1860 Presidential candidates were nominated again, but under the name Constitutional Union Party; but the movement was practically merged in the growth of the Republican Party.

II. A party under this name was organized in 1872 by some members of the National Christian Association at Oberlin, O. It was opposed to secret societies, demanded prohibition of the saloon, recognition of the Sabbath, introduction of the Bible into the public schools, restriction of land monopoly, specie payments, justice to the Indians, and a direct popular vote for President and Vice-President. Charles Francis Adams was nominated for President. Nominations continued to be made down to 1884, when the nominee, S. C. Pomeroy, withdrew in favor of the Prohibition candidate, St. John, on his assurance that "he stood on every plank of the American platform," since when the party has been practically merged into the Prohibition Party.

III. Another party was organized under this name in Philadelphia September 16-17, 1887. It declares for the limitation of immigration; exclusion from citizenship of "anarchists, socialists, and other dangerous characters;" free schools, absolute religious freedom, the enforcement of the Monroe Doctrine, and condemns the granting of land to aliens or to corporations.

AMERICAN PROPORTIONAL REPRESENTATION LEAGUE, THE.—For a discussion of PROPORTIONAL REPRESENTATION see that subject. August 11, 1893, a Proportional Representation Congress was held in Chicago, and as a result the American Proportional Representation League was founded. Its constitution is as follows:

"Article I. Name. This Society shall be known as the American Proportional Representation League.

"Art. II. Object. Its object shall be to promote the reform of legislative assemblies by abandoning the present system of electing single representatives from limited territorial districts by a majority or plurality vote, and by substituting the following:

"1. All representatives shall be elected at large, on a general ticket, either without district divisions or in districts as large as practicable.

"2. The election shall be in such form that the respective parties, or political groups, shall secure representation in proportion to the number of votes cast by them, respectively.

"Art. III. Membership. Any person in the United States or Canada who shall subscribe to the purpose of this League may become a member. The dues shall

be \$1 per annum. Members are entitled to the publications of the League without charge.

"Art. IV. Officers. The officers shall be a President, a Secretary, who shall also be Treasurer, and a Committeeman from each State and Territory in the United States and province of Canada. The officers shall be elected annually by ballots, to be forwarded to the Secretary by mail. The President and Secretary-Treasurer shall be chosen by the whole membership, and the Committeemen by the members of their respective States, Territories, and provinces.

"Art. V. Publications. An official bulletin shall be issued under the direction of the Secretary as often as the funds of the League will permit."

The League has issued the following address to the public:

"The political, social, and economic agitations which have taken hold of this generation, and turned the civilized countries into debating societies, betray a spirit of restless inquiry after truth which must sooner or later produce tangible results. And as the discussion nears the end, and the time for action approaches, thoughtful, earnest citizens are confronted with the fact that wherever reform must be obtained through political action, that action is delayed, if not prevented, by a system of representation which fails to accomplish the purpose for which it was intended. The various reformers as they approach the law-making bodies, whether they be city councils, State legislatures, or national congresses and parliaments, find that that branch of government which should reflect in miniature the whole country, instead mirrors the opinions of only a privileged few. Tho these reformers may number a considerable part of the body politic, they find it impossible to secure representation in the halls of legislation.

"The effect of this state of affairs has been to create a feeling of recklessness on the part of some men and of apathy on the part of others. Some propose to right their grievances by force; others give up the fight and withdraw from the field in disgust. All are prone to despair when they realize the Herculean task of securing a hearing of the so-called representatives of the people. They see that Iowa, with 210,215 Republican votes and 207,923 Democratic votes, at the election of 1892 sent 70 Republican Congressmen and one Democrat to Washington; that every 21,921 Republicans of that State has a representative, while the whole 207,923 Democrats have but one. In Kentucky the case is reversed. The Democrats have a Congressman for every 17,436 votes, while the Republicans have one for 122,308. In Maine the vote was 65,637 Republicans and 57,778 Democrats, but the Republicans got all the four Congressmen. In Maryland the vote was 91,762 Republicans and 113,931 Democrats, but the latter got the six Congressmen. The Republicans of Texas have not had a representative in Congress since 1882. The Democrats of Kansas have not had a representative since the State was admitted to the Union, tho they have polled from a third to two fifths of the vote of the State during that time. And even the votes of the successful parties only mean that the persons who cast them merely preferred one of the party candidates to another; instead of a free choice, they had a forced alternative.

"Many people attribute this state of affairs to the gerrymander. But while the practice of making dishonest districts cannot be too strongly condemned, the gerrymander has been made the scapegoat for a system which of itself is wrong; for it must be apparent that if one party has a majority in the whole State there is a tendency for it to have a majority in each district, no matter how its boundaries be made. If there be 40 Democrats and 51 Republicans in each township, the Republicans will have all the representatives any way the districts are made, though the Democrats have 49 per cent. of the votes. Should there be 33 Republicans, 33 Democrats, and 34 Populists in each township, the latter would have all the representatives, tho they had but 34 per cent. of the votes. It is only because the voters are not evenly distributed that the minority of a city, county, or State can secure any representation at all. Let this be expressed in tabular form:

Districts.	cc	bb	aaa	Representatives.
1.	cc	bb	aaa	A
2.	cc	bb	aaa	A
3.	cc	bb	aaa	A
4.	cc	bb	aaa	A
5.	cc	bb	aaa	A
6.	cc	bb	aaa	A
7.	cc	bb	aaa	A

"Supposing each letter to represent 1000 votes, the 'a's' with 21,000 votes secure all the representation, while the 'b's' and 'c's' with 14,000 votes each, or considerably more than half the total, have none. The fault lies in the system itself. While dishonest men can sometimes increase the evil effects, it is impossible for the wiser and more honest to secure good effects. It must make way for a system which is not only scientific and just in principle, but which is working to perfection in Switzerland to-day—proportional representation.

"Proportional representation is based upon the principle that if a certain political unit, whether it be State, city, or county, has a given number of representatives, each proportionate part of the voters in that political unit should have one representative. That is to say, if a State with four Congressmen has 100,000 votes, each 25,000 voters should have one Congressman. Proportional representation accomplishes this by wiping out the district lines and allowing the citizens to vote as they please in the State. The total number of votes cast at the election is divided by the number of representatives to be chosen, which gives the electoral quotient, or quota, which is the number of votes necessary to elect one representative. Each party or group of voters is then given as many representatives as the electoral quota is contained times in their vote. Nominations may be made as at present by parties or by petition,

A Declaration of Principles.

and the voting done as at present, the only difference being that the successful candidates are taken from the various parties in proportion to their respective votes, instead of taking them all from the majority party. Take as an example the Congressional election of Indiana in 1892. The total vote cast for Congressmen was: Republican, 253,640; Democratic, 259,184; Prohibition, 12,358; Populist, 24,223, making a total of 549,405 votes. If 549,405 votes elect 13 representatives, one thirteenth of that number should elect one. Hence, dividing the total number of votes cast, 549,405, by the number of representatives to be elected, 13, gives as the electoral quota 42,262. The 253,640 Republican votes divided by this quota give six full quotas and a remainder of 68 votes. The 259,184 Democratic votes divided by the quota give six full quotas and a remainder of 572. As neither of the remaining parties has enough votes to fill a quota, the remaining representative is taken from the party having the largest unfilled quota, the Populist. This would make the Indiana delegation six Republicans, six Democrats, and one Populist, instead of the two Republicans and 11 Democrats who were elected.

"In the one case the districts are so constructed by nature or by parties that a small handful of voters holds the balance of power. By voting as a unit they are able to throw the election one way or the other. Hence these men have great influence with the two dominant parties; each feels that it must do everything to capture this vote, and as the independent controlling vote is almost invariably of the lowest moral type, the tendency is to nominate men of that stamp. In the other case the districts are abolished and the State votes as a whole, dividing the candidates proportionately among the various political parties. Then it is found that these professional politicians, who before controlled the elections, are not numerous enough all combined to fill a quota, and whatever their number, they can secure only such representation as their numbers entitle them to. As the tendency now is to nominate men acceptable to the worst elements of our political life, so under proportional representation the tendency would be to nominate men who were acceptable to the mass of the people. If the mass be good they will elect good men, if it be evil they will elect evil men; they can elect whatever kind of representatives they wish, which they cannot now do. As under the present system candidates are nominated because of their cowardly, time-serving traits, under proportional representation only those can hope for success who openly declare themselves for some definite policy.

"The great mass of the voters of this country are divided between the Republican and Democratic parties, but in most of the districts throughout the country one or the other has such a decided majority that the election is a mere formality. General Garfield, in a speech before the House of Representatives, in 1870, said:

"In my judgment it is the weak point in the theory of representative government, as now organized and administered, that a large part of the people are permanently disfranchised. There are about 10,000 Democratic voters in my district, and they have been voting there for the last 40 years without any more hope of

having a representative on this floor than of having one in the Commons of Great Britain."

"Twenty-three years have been added to the forty, and still the Democrats of that district maintain the forlorn hope. If this be so of the Democrats in Iowa and Maine, and of the Republicans of Texas and Kentucky, what can be said of the new parties, the independent movements here and there throughout the country? Tho they poll many times more than enough votes to fill an electoral quota they are absolutely disfranchised. In the election of Congressmen in 1892 there were 12,032,203 votes polled, and yet 5,531,965 of these voters can say, as they look upon the House of Representatives: 'There is not one among all these 356 members who represents us.' If the 356 members should vote unanimously upon any question, they would represent but 54 per cent. of the voters who voted at their election. And should a bare majority of the members pass a law it would represent only 21.4 per cent. of the citizens who voted at that election. Thus, in a government in which the majority is supposed to rule, it is found that the representatives of a trifle over one fifth of the people can make the laws for the remaining four fifths.

"It will be said, of course, that these four fifths are not absolutely disfranchised, because, tho they failed to elect the man they voted for in their district, their party fellows elected one in some other district. Cold comfort, indeed! What consolation is it to the gold-money Democrat of Maine to know when his candidate fails of election that the free silver Democrat of Missouri was successful? What does the free trade Republican of Kentucky care for the success of the protection Republican of Massachusetts? And even if these should be comforted by the fact that men bearing the same party name, tho professing different principles, are successful, what can be said of the million or more voters throughout the country who voted for the independent tickets? And what of the still greater number who voted not at all, or for the lesser of two or several evils? What of the intelligent citizens who long for fit representatives in the halls of legislation and proclaim popular government a failure because they have hoped in vain?

"The fact that minorities will secure representation is the least important of all the good which will result from the adoption of proportional representation. While it is true that an intelligent representative of the various reform movements would tempt to the arbitrary action of the majorities and be an educational force of great value, and should therefore be striven for by all men who wish to better the condition of society through legislative action, yet the great end to be gained by proportional representation is the direct representation of all the people. When every citizen votes with the full assurance that each individual vote bears directly upon the final result, the men who have withdrawn in despair from politics, as something with which an honest man can have nothing to do, will return to their duty. There will be no wasted majorities and hopeless minorities cooped up in political slave pens; each and every party will secure representation in proportion to its numbers, and a majority of the representatives in the Assembly will always represent a majority of the people. Then, and not till then, will legislative bodies become quickly responsive to the will of the people; then, and not till then, will the citizen realize the power of his single vote; then, and not till then, will honest government be possible; then, and not till then, shall we have in fact what we have now in theory—a government of the people, for the people, and by the people."

The President of the League (1895) is Hon. Wm. Dudley Foulke, Richmond, Ind.; Secretary, Stoughton Cooley, 22 Fifth Avenue, Chicago, Ill.

AMERICAN PROTECTIVE ASSOCIATION, THE.—This association, commonly called the A. P. A., is a secret association, and is said to have somewhat changed its name recently, so that members sometimes declare that they are not members of the A. P. A., and that there is no such organization. Nevertheless, the organization admittedly continues known to the public as the A. P. A., and contends for the principles identified with that name. Its platform, as announced to the public, adopted by

the Supreme Council at Des Moines, Ia., May 4, 1894, is as follows:

"1. Loyalty to true Americanism, which knows neither birthplace, race, creed, nor party, is the first requisite for membership in the American Protective Association.

"2. The American Protective Association is not a political party and does not control the political affiliation of its members, but it teaches them to be intensely active in the discharge of their political duties in or out of party lines, because it believes that all the problems confronting our people will best be solved by a conscientious discharge of the duties of citizenship by every individual.

"3. While tolerant of all creeds, it holds that subjection to and support of any ecclesiastical power, not created and controlled by American citizens, and which claims equal if not greater sovereignty than the Government of the United States of America, is irreconcilable with American citizenship. It is, therefore, opposed to the holding of office in National, State, or Municipal Government by any subject or supporter of such ecclesiastical power.

"4. We uphold the Constitution of the United States of America, and no portion of it more than its guarantee of religious liberty; but we hold this religious liberty to be guaranteed to the individual and not to mean that under its protection any un-American ecclesiastical power can claim absolute control over the education of children growing up under the Stars and Stripes.

"5. We consider the non-sectarian free public school the bulwark of American institutions, the best place for the education of American children. To keep them as such we protest against the employment of subjects of any un-American ecclesiastical power as officers or teachers of our public schools.

"6. We condemn the support out of the public treasury by direct appropriation, or by contract of a sectarian school, reformatory, or other institutions not owned and controlled by public authority.

"7. Believing that exemption from taxation is equivalent to a grant of public funds, we demand that no real or personal property be exempt from taxation, the title to which is not vested in the National or State Governments, or in any of their subdivisions.

"8. We protest against the enlistment in the United States army, navy, or the militia of any State, of any person not an actual citizen of the United States.

"9. We demand for the protection of our citizen laborers the prohibition of the importation of pauper labor, and the restriction of all immigration to persons who can show their ability and honest intention to become self-supporting American citizens.

"10. We demand the change of the national naturalization laws by a repeal of the act authorizing the naturalization of minors without a previous declaration of intention, and by providing that no alien shall be naturalized or permitted to vote in any State in the Union who cannot speak the language of the land, and who cannot prove seven years' continuous residence in this country from the date of his declaration of intention.

"11. We protest against the gross negligence and laxity with which the Judiciary of our land administer the present naturalization laws, and against the practice of naturalizing aliens at the expense of committees or candidates, as the most prolific source of the present prostitution of American citizenship to the basest uses.

"12. We demand that all hospitals, asylums, reformatories, or other institutions in which people are under restraint, be at all times subject to public inspection, whether they are maintained by the public or by private corporations or individuals.

"13. We demand that all National or State legislation affecting financial, commercial, or industrial interests be general in character, and in no instance in favor of any one section of the country, of any one class of people."

The organization was founded at Clinton, Ia., about 1887, by H. F. Bowers, and has now grown to large numbers. It has spread into Canada, and has crossed to England and Australia, and is now organized as an international movement with a general platform as far as nationality is concerned, but contending for the same general principles. A member of the order says, in a printed circular:

"The A. P. A. is not a 'benefit' order—it gives neither life insurance, sick benefits, nor any other financial aid, as an order. The membership is not confined to natives of the United States; but all Protestants—after rigid scrutiny and if satisfactory—are eligible for membership—that is, men of 18 years and upward. The order is, first of all, American and Protestant. It is, at the same time, aggressive—it means fight!—with the ballot and with every other legitimate weapon.

"Of the men who make up its membership, it should be said that recent inquiry developed the fact that in the order there were nearly 1800 clergymen of various Protestant denominations; college presidents and professors, editors by scores, school-teachers by hundreds; bankers, railroad magnates, merchants, manufacturers, professional men of every description; artists, mechanics, salesmen, soldiers, and sailors. In some of the Western cities, every official, from mayor down, is a member of the order.

"Of course it is a secret order, because it is fighting a secret foe—the Jesuits. Would it be wise for a commander to make his plan of attack public before the battle? What success would Grant, Sherman, Sheridan, or others have had, had they given to the newspapers all their plans?

"The members are men who are sick of the apathy and supineness so prevalent in Protestantism, in Americans generally, who allow Rome to trample in the dust their most cherished institutions without a word of protest and allow the many-tentacled monster to seize and control city after city, without even a murmur."

The reasons given for the existence of the order are stated by the same writer to be as follows:

"The Roman Catholic attack on our public-school system.

"The attempted foreignizing, by force, of whole communities, in language and religion, by Romish priests.

"The complete control of our great cities by Romanism.

"The fact that our army and navy are almost wholly Romanized.

"The remarkable increase of untaxed church property.

"The frequent desecration of the American flag by priests.

"The Jesuit control of the heads of the Government at Washington.

"The well-known public declaration of the Pope that the United States is his one bright hope for the future.

"The universal brag and bluster of Romish orators and newspapers that Americans are cowards, and that all the good which has ever come to this nation has come from Romanists."

We give these quotations, not as coming officially from the order, but as unquestionably correctly showing the feeling of the order. As a proof of the need of the order, the Rev. James B. Dunn, Secretary of the Committee of One Hundred, of Boston, Mass., in a tract published by the committee, quotes from the papal encyclical of January 10, 1890, where the Pope bids Roman Catholics

"Even in politics, always to serve first the interests of Catholicism, and to submit themselves in obedience to the will of the Pontiff as to God Himself, and that the civil laws are binding on them only so long as they are conformable to the Roman Catholic religion. In that same encyclical the Pope says it is a duty to resist all civil laws hostile to anything ordered by the Church, and a crime to obey them. These being the facts, is it not quite certain that whatever his private or personal opinion and feelings may be as an American citizen, every good Roman Catholic must support the Church as against the State?"

"That cases happen in which the State demands one thing from the citizen, and religion the opposite from Christians, and this undoubtedly for no other reason than that the heads of the State pay no regard to the sacred power of the Church, or desire to make it subject to them. No one, however, can doubt which is to receive their preference."

It is an impious deed to break the laws of Jesus Christ for the purpose of obeying the magistrates, or to transgress the laws of

**Papal
Encyclicals.**

the Church under the pretext of observing the civil law.

"If the laws of the State are in open contradiction with the Divine law, if they command anything *prejudicial to the Church*, or are hostile to the duties imposed by religion, or violate in the person of the Supreme Pontiff the authority of Jesus Christ, then indeed it is a duty to resist them and a crime to obey them—a crime fraught with injury to the State itself.

"Furthermore, in politics, which are inseparably bound up with the laws of morality and religious duties, men ought always and in the first place to serve, as far as possible, the interests of Catholicism. As soon as they are seen to be in danger, all differences should cease between Catholics. Since the fate of States depends principally on the disposition of those who are at the head of the Government, the Church cannot grant its patronage or favor to men whom it knows to be hostile to it, who openly refuse to respect its rights; who seek to break the alliance established by the nature of things between religious interests and the interests of the civil order. On the contrary, its duty is to favor those who, having sound ideas as to the relations between Church and State, wish to make them both harmonize for the common good. These principles contain the rule according to which every Catholic ought to model his public life."

Dr. Dunn also quotes Vicar-General Preston, in a sermon, as saying :

"Every word Leo speaks from his high chair is the voice of the Holy Ghost, and must be obeyed. To every Catholic heart comes no thought but obedience. It is said that politics is not within the province of the Church, and that the Church has only jurisdiction in matters of faith. You say, 'I will receive my faith from the Pontiff, but I will not receive my politics from him.' This assertion is disloyal and untruthful. . . . You must not think as you choose; you must think as Catholics. The man who says, 'I will take my faith from Peter, but I will not take my politics from Peter,' is not a true Catholic. The Church teaches that the supreme Pontiff must be obeyed, because he is the vicar of the Lord, Christ speaks through him."

And from one of Cardinal Manning's sermons on ecclesiastical subjects, representing the Pope as saying :

"I acknowledge no civil superior; I am the subject of no prince; and I claim more than this. I claim to be the supreme judge on earth, and director of the consciences of men; of the peasant that tills the field, and the prince that sits on the throne; of the household that lives in the shade of privacy, and the legislature that makes laws for kingdoms. I am the sole last supreme judge on earth of what is right and wrong."

Of these and other similar quotations Dr. Dunn says :

"In view of such declarations and teachings, we ask, Can a good Romanist be at the same time a loyal American citizen?

"Many Romanists, no doubt, mean to be loyal citizens of the Republic, and honestly think they are; yea, we are quite willing to believe that the great body of them have no wish to interfere with the liberties and institutions of America, and that if called upon to choose between serving our Government and the power at Rome, think they would abjure Rome. But it must be remembered that they belong to a system in which free agency is impossible. As we have seen, the Vatican claims absolute and supreme authority in all things, civil as well as spiritual, and every member of that Church is bound to render to the Pontiff absolute and unquestioning obedience. This being true, is it not quite certain that whatever his private or personal opinions and feelings may be as an American citizen, he must support the Church as against the State? . . . Can any person who is loyal to Romanism be true to Republicanism? Can a Romanist be a good citizen of America? . . .

The United States Supreme Court has decided that the law of one of our States, disfranchising Mormons, is constitutional, on the theory that the man who takes the oath the Mormons are required to take cannot be a good citizen. Why should not this principle be applied to those who confess allegiance to the Papal hierarchy? How much longer will this flagrant violation of citizenship be permitted in America?

"Is it not high time for the nation to decide which is supreme, the Church or the State—to which authority citizens owe allegiance?"

"How long would the nation allow one eighth of her population to enjoy all the rights and privileges of American citizenship, while owing allegiance to any other foreign power, say Austria or Russia? Why permit this to be done with those who own allegiance to the Pontiff at Rome?"

"Let Romanists who would become citizens of the United States be required not only to take the oath of allegiance to the Government, but to take an oath also renouncing all primal allegiance to the Pope. This is not a question of religious intolerance, nor is it one of antagonism to foreigners who are willing to homologate with us in accordance with the spirit of our institutions. We would not cut down by a single span the splendid proportions of national freedom; we would not abridge the liberty of party, sect or individual. But this is a question of self-protection and self-preservation, and the law of self-preservation is supreme in all social and political organizations. We would guard and preserve our liberty from the hands of hate and the assaults of foes.

"Romanism is a political system. It is a political power; as a political power it must be met, as a political force it must be treated when viewed in its relation to our institutions. It does not make any difference whether the political power that assails our institutions is on the shores of the Baltic, on the shores of the British Channel, or on the shores of the Tiber, it must be met. We can have no divided citizenship. No man should be allowed to participate in the political affairs of this country who is the subject or ally of a foreign power that is at war with our national institutions. No ballot for the man who takes his politics from the Vatican!"

Such is probably as good a statement of the position of the A. P. A. as can be made. The order claims to-day (1895) about 2,000,000 members in the United States. Its prominent (1895) members are said to be: Supreme President, W. J. H. Traynor, of Detroit; Vice-President, Adam Fawcett, of Ohio; Secretary of State, O. B. Jackson, of Boone, Ia.; Chaplain, J. J. Gosper, of San Francisco; Secretary, C. J. Beatty, of Saginaw, Mich.; Treasurer, H. M. Stark, of Milwaukee; Trustees, F. C. Campbell, of Minneapolis; N. D. McDonald, of Cheyenne, Wyo.; and W. H. Nichols, of Braddock, Pa.

There are various minor orders of a similar nature, some started as a split from the A. P. A., some much older than the A. P. A., and of a somewhat similar nature, such as the Order of American Mechanics and the Junior Order of American Mechanics, which number some 200,000 members, and the Patriotic Order of Sons of America—these three admitting only natives of the United States to membership. Then there are the Knights of Malta, the Alfredians, the Order of Deputies, and that oldest and universally known Protestant order, the Orangemen.

The National League for the Protection of American Institutions (*q. v.*) is an unsectarian league to secure constitutional and legislative safeguards against any appropriation of public funds for sectarian schools or any sectarian purposes.

(For an answer from the Roman Catholic standpoint to the statements of the A. P. A. see ROMAN CATHOLIC CHURCH AND SOCIAL REFORM.) But Romanists are by no means the only ones who criticise and oppose the attitude of the Arguments A. P. A. The Rev. H. K. Carroll, against the D. D., a Methodist clergyman, and A. P. A. one of the editors of *The Independent*, writes, in the *Methodist Review* for March-April, 1895, a strong plea for Protestants to conquer their prejudices and to

remember that the Church of Rome is a Christian Church; and, as far as its fundamental doctrines go, orthodox. Concerning the assertion that Roman Catholics cannot be good citizens, Dr. Carroll says :

"1. Are Catholics disloyal? I do not remember ever to have seen the affirmative of this question supported by the citation of any act. It is commonly argued from the doctrine of papal supremacy. Catholics, it is urged, know no higher law than obedience. The people obey the priests implicitly, the priests are in complete subjection to the bishops, and the bishops are bound to do whatever the Pope tells them. This Pope is a foreign potentate who assumes to be superior to kings and governments; and he would, if he could, subordinate the State to the Church. In answer let me ask, Is it not obvious that he could not if he would? Where is there a State over which he exercises even a shadow of sovereignty? There are countries, like Italy, Austria, Spain, and Portugal, which are overwhelmingly Catholic. Surely there, if anywhere, this assumed prerogative would be asserted. It is not. The Pope has no quarrel, even with the Government of Italy, on this point. All that he asks of King Humbert—and he asks this less and less often and more perfunctorily—is that the seat of his spiritual empire be made papal or neutral territory, so that he shall be independent of all governments. Everybody admits that this concession will never be made. Now, if the Pope cannot obtain control over a Catholic power, what possible chance has he of doing so over a great Protestant power like the United States? The idea of such a thing seems to me preposterous. If the Church is as cunning, as unscrupulous, as adept in trickery as it is sometimes said to be, why has it not carried its point in Italy, where the Church has its seat of government, and where the people are intensely Catholic? If the Pope really desired to subvert our Government, of which there is not the slightest evidence, what object could he have in view? The establishment of a monarchy? This is inconceivable. It is true enough that the idea at Rome used to be that monarchies were of divine right; but this idea has been modified, and the Pope has recognized in France—the oldest son of the Church—the divine right of republics. If our own republic were ever intolerable to the Holy See, why were Catholics allowed to assist in establishing it?"

Dr. H. K. Carroll's views.

"A hypothetical case is sometimes put, thus: Suppose an issue were to arise in which Catholics had to choose between their country and their Church, between their patriotism and their religion—what then? I reply, that this question is just as pertinent respecting members of other denominations as of Catholics. It is often said by way of condemnation that if a Catholic had to choose between his faith and his country's requirements, he would sooner give up his allegiance to his country than to his religion. Well, who wouldn't? Religion embraces our duty to God. Isn't that our highest duty? And if conflict comes, who that is worthy of the Christian name would abjure his faith? This is only an idle question; such an issue is in the highest degree improbable; but our prejudice provokes our fears, and our fears are wild and unreasoning."

Concerning the relation of the Roman Catholic Church to our public schools, Dr. Carroll says :

"2. Does the Church of Rome desire to destroy our public school system? 'Destroy' is a strong word. I doubt whether it is right to apply it even to the most hostile opinion that prevails among the hierarchy. The most any Catholic has asked for is exemption from payment of the public school tax or division of the school funds. In neither case would the system be destroyed. If the first alternative were adopted it would impair the integrity of the system and limit it. It would not be for all the people, as it is now, but only for the larger part of them. If the second proposal were accepted we should have in this country the conditions that prevail in England and elsewhere. We should have both the secular and religious elements represented in our public schools. The system would be greatly changed and impaired, but it would not be destroyed. It would not be fair, I think, to say that the hierarchy would destroy our public school; but it is fair to say that they are not satisfied with it as it is."

Concerning a much-quoted passage from the Boston *Pilot*, which says that "no good government can exist without religion; and there can be no religion without an Inquisition, which is wisely designed for the promotion and protection of the true faith," Dr. Carroll explains that this does not call for a revival of the tortures of the Middle Ages, but refers to one of the present sacred congregations, *Congregatio Sacri Officii*, or *Romanæ et Universalis Inquisitionis*, bodies "whose duty it is to examine and repress heretical and depraved doctrines and offenses."

Another strong argument against the position of the A. P. A. not used by Dr. Carroll in this article is, if there be danger to American liberty in the Roman Catholic Church, that danger comes from the ignorance of many in her communion, and that the best way to overcome this is not to organize against Roman Catholics, and so drive their children from our public schools into parochial ones, where they will simply grow more subservient to their priests, but rather to welcome them to our schools, giving them a fair share of the teachers, treating them in every way fairly, and so to educate the children away from whatever there may be that is false in the Romish system.

It can be shown that democratic ideas are making fatal inroads into the Church of Rome. In this encyclopedia we are concerned only with social and political questions, but if any hold that the Church of Rome is dangerous to democratic liberty, it is asserted that they have only to look at statistics to see that the one way to increase the power of Rome is to organize against her. She appears to be growing in this country simply because so many Roman Catholics have immigrated to our shores. As a matter of fact, she does not retain even those who are naturally her own. From 1850-94, 13,462,367 immigrants have landed in this country; of these, at least three fifths, or 8,077,419, have been Roman Catholics, while, according to the census of 1890, there were only 6,231,417 Roman Catholic communicants or members in the whole country. Roman Catholics themselves know that they are not holding their own against democratic institutions. Cardinal Gibbons, in his pastoral letter of 1883, says: "While we are gratified with the number of converts who embrace the true faith, we have reason to be appalled in considering the vast number of souls that are straying away from the fold. If we look for the descendants of those families that have been immigrating from Catholic Europe to this country in one uninterrupted march from the beginning of the present century, how many of them shall we now find ranking among the most bitter and unrelenting enemies of the Church?" The *Catholic Mirror*, of Baltimore, in 1885 stated that the Catholic population of this country naturally ought to be 20,000,000, and was only 8,000,000. Therefore many who are by no means favorable to the political influence of the Roman priesthood argue that the one way to defeat it is to let Rome alone and to spread democratic education, and that the one way to extend the power of Rome is to organize against her and drive her children into parochial schools.

AMERICAN PURITY ALLIANCE, THE, was incorporated under this name only in 1895, but is the continuation of the New York Committee for the Prevention of State Regulation of Vice, which commenced its work in 1870, and has held 19 annual meetings. Its constitution in its articles of public interest is as follows:

"In view of the widespread suffering, physical disease, deplorable hereditary results, degradation of manhood and womanhood, and the peril to the home, society, and the State, involved in the prevalent immorality, we do hereby agree, with a prayerful reliance upon Divine aid, to form ourselves into an Association, to be governed by the following Constitution: "Article I. This association shall be called the American Purity Alliance.

"Art. II. The objects of this Alliance are the repression of vice, the prevention of its regulation by the State, the better protection of the young, the rescue of the fallen, the extension of the White Cross among men, and to maintain the law of purity as equally binding upon men and women.

"Art. III. Any person who consents to the principles of this constitution, and who contributes annually \$1 or more to its funds, may be a member of this Alliance, and shall be entitled to a vote at the meetings.

"Art. VIII. Any purity or White Cross association founded on the same principles may become auxiliary to this Alliance by contributing annually the sum of \$5 to its treasury."

Says the latest report of the Alliance (1895):

"As we enter upon the twentieth year of our work in behalf of a high and equal standard of morality, alike for both sexes, we are reminded, in a retrospective view, that the past 19 years of service have made a history for which we had no plan in our informal beginning. It was in the summer of 1876 that a few of us organized as a Committee, with the revered Abby Hopper Gibbons as our president, to respond to an appeal brought to us by a deputation from the International Federation for the Abolition of State Regulation of Vice, an organization of which Mrs. Josephine E. Butler, of England, is the heroic, consecrated leader. The grave and painful message which these delegates—the Rev. J. P. Gledstone and Mr. H. J. Wilson, M.P., of England—brought to us to warn us of the danger to which we were exposed, was intensified by the fact that an effort was made about that time to establish the old-world system of State-sanctioned vice in New York. We found local work to do at once to thwart the evil scheme, and it has proved that we have had need to keep continued and unremitting watch and guard over legislation in our own and other States all these intervening years. Meanwhile, we have also done what we could to spread a knowledge of the important mission of the International Federation and the principles involved in the movement, which were very little understood in this country. We have worked in quiet ways, chiefly through the types. *The Philanthropist*, published monthly for nearly a decade, has reached and awakened the interest of a valuable constituency of earnest, thoughtful people scattered throughout the country, who have given us their helpful cooperation, and our work has thus extended and broadened. We therefore find it desirable now to give ourselves a more fitting title, hence the change of name to that of *The American Purity Alliance*, by which we can also give those who have become our allies their proper recognition in auxiliary societies and otherwise."

History.

The League works by the dissemination of literature, meetings, the holding of purity congresses, the careful watching of legislation, etc., and has devoted itself especially to raising the age of consent, to preventing attempts to lower the age, and to agitation against the State control or licensing of prostitution. Its President (1895) is Aaron M. Powell; the Chairman of its Executive

Committee, Emily Blackwell, M.D.; its Corresponding Secretary, Anna Rice Powell, 243 East Sixth Street, Plainfield, N. J.; its Treasurer, Elizabeth Gay, West New Brighton, N. Y.; its office, 39 Nassau Street, Room 37, New York.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—See RAILWAY, ORGANIZATIONS OF.

AMERICAN RAILWAY UNION.—See RAILWAY EMPLOYEES, ORGANIZATIONS OF.

AMERICAN SOCIAL SCIENCE ASSOCIATION, THE.—This association was founded in 1865. Its present constitution is as follows:

I. This society shall be called the American Social Science Association.

II. Its objects shall be classified in five departments: The first, of Education; the second, of Health; the third, of Trade and Finance; the fourth, of Social Economy; the fifth, of Jurisprudence.

III. It shall be administered by a president, as many honorary vice-presidents as may be chosen, a treasurer, a secretary, and a council, charged with general supervision; five department committees, established by the council, charged with the supervision of their respective departments; and such local committees as may be established by the council at different points, to serve as branch associations. The council shall consist of the president, treasurer, and secretary, the chairman and secretary of each department, and 10 directors, with power to fill vacancies and to make their own by-laws. The president, vice-presidents, treasurer, chairman, and secretaries of departments, and directors shall be chosen annually by members of the association, and shall hold office till their successors are chosen. The president, or in his absence a director, shall be chairman of the council. The chairman of the local committees shall be chosen at the pleasure of their respective committees. Whenever a branch association shall be organized and recognized as such by the council, its president shall be *ex-officio* one of the vice-presidents of the American Association, and, together with the secretary and treasurer, shall be entitled to all the privileges of membership in that association. And whenever a local department shall be organized and recognized as such by the council, its chairman shall become *ex-officio* a member of the parent association. The chairman and secretary of each department, with the consent of the president of the association, may appoint such special department committees as they may think best. The general secretary shall be elected for three years, unless he resigns, or is removed by a two-thirds vote of the members present and voting in a regular meeting of the council; and out of his compensation he may pay the salary of an assistant secretary, who may also be secretary of one department.

IV. Any person may become a member by paying \$5, and may continue a member by paying annually such further sum as may be fixed at the annual meeting, not exceeding \$10. On payment of \$100, any person may become a life member, exempt from assessments. Honorary and corresponding members may be elected and exempted from the payment of assessments. **Constitution.**

V. The council shall have sole power to call and conduct general meetings, and to publish the transactions and other documents of the association. The department committee shall have power to call and conduct department meetings.

VI. No amendment to this constitution shall be made, except at an annual meeting, with public notice of the proposed amendment.

It has not been the practice of the association to elect members, but to extend a particular or a general invitation (as now) to all who are interested in social science, and wish to promote the spread of sound knowledge on the important topics involved in education, health, finance, jurisprudence, and social economy. Founded

at the very close of the Civil War, it has since aided, directly or indirectly, in the formation of other valuable societies—the National Prison Association, the Civil Service Reform Society, National Conference of Charities, several of the State conferences and charity organization societies, the American Historical Association, American Economic Association, etc. It has also been instrumental in promoting departments or professorships of social science in many universities and colleges which are now doing an extensive work of instruction.

Its present officers (1895) are : President, F. J. Kingsbury, Waterbury, Conn. First Vice-President, H. L. Wayland, Philadelphia, Pa. Vice-Presidents, Francis Wayland, New Haven, Conn. ; Daniel C. Gilman, Baltimore, Md. ; William T. Harris, Washington, D. C. ; Carroll D. Wright, Washington, D. C. ; Mrs. John E. Lodge, Boston, Mass. ; Lucy Hall-Brown, M.D., Brooklyn, N. Y. ; Mrs. Caroline H. Dall, Washington, D. C. ; S. W. Dike, D.D., Auburn, Mass. ; Charles A. Peabody, New York ; Andrew Dickson White, Ithaca, N. Y. ; Grace Peckham, M.I., New York ; Henry B. Baker, Lansing, Mich. ; Dorman B. Eaton, New York ; Henry Villard, New York ; H. Holbrook Curtis, M.D., New York ; R. A. Holland, St. Louis, Mo. ; John Eaton, Washington, D. C. General Secretary, F. B. Sanborn, Concord, Mass. Treasurer, Anson Phelps Stokes, 45 Cedar Street, New York.

The secretary says of the founding of the association :

"It was the scarcity of material for the investigation of social questions, indeed, which suggested to the founders of this association the importance of bringing together in this way the persons interested in the development of civilization here, and in setting forth its results and its unsolved problems for the information and guidance of each other. However the conception of such a society as ours originated—and I fancy it was obtained from the earlier society of the same name in England, now unhappily defunct—the idea was communicated in practical form to the American public by my colleagues of the Massachusetts Board of State Charities, in August, 1865. This board, the earliest of some 15 which now exist in the United States, and which convene every year in the National Conference of Charities, had found since October, 1863, when it was established, that the general information it sought in regard to

Its Object.

the topics of Poverty, Industry, Insanity, Pauperism, Crime, and Disease were very hard to obtain, because there was no common center to which such facts would naturally be drawn. Its seven members, therefore, after nearly two years of active service, united in summoning those persons interested in these and in other social topics to meet in convention at the Massachusetts State House in Boston, and there organize an association similar to that existing in England, and to another in Belgium. To this invitation about 300 persons, from all parts of the Northern States except the extreme West, responded ; and the American Social Science Association was then and there founded, under the presidency of Professor William B. Rogers, then at the head of the Massachusetts Institute of Technology, but extending his regard over the whole field of science as much as any man in America."

Speaking of the development of social science in this country, after referring to the development of the census and of national and State labor bureaus, the secretary says :

"Not a single lunacy commission, State board of health, labor bureau, or prison commission existed, I think, in the United States when we organized the association in 1865. There was but one State board of charities, as I have said, and that had made but one report. It existed till it had made 15, all more or less valuable for the facts they contained. It was then succeeded by another State board in Massachusetts,

with fuller powers—among them those of a lunacy commission—and this second board has made 12 reports. The New York State Board of Charities has made 23 annual reports ; that of Rhode Island as many ; that of Pennsylvania, 21 ; that of Ohio, 15 ; and the other States a smaller number, because they report only biennially. Now, all these volumes, if brought together, make a library by themselves ; and if we add to them the 18 volumes, small and large, of the National Conference of Charities, and the publications—some of them very valuable—of the New York State Charities Aid Association, the New York Prison Association, and the National Prison Association, a great collection of material of much variety and importance is available in a dozen libraries throughout the country for the use of students."

AMERICAN STATISTICAL ASSOCIATION, THE.—This association was organized in 1839, and has a membership of about 600. A quarterly publication was begun in 1888, by means of which special statistical monographs are being presented to the public, and in addition this journal contains a record of current statistical literature, which is intended to inform the members concerning the most important and recent statistical inquiries made in foreign countries. With this in view there is now prepared a *résumé* of the foreign periodicals and journals devoted to statistics. This publication has reached its twenty-fourth number, and is already recognized as a valuable record of statistical work. The present constitution of the association is as follows :

ART. I. This association shall be denominated the American Statistical Association.

ART. II. The objects of the association shall be to collect, preserve, and diffuse statistical information in the different departments of human knowledge.

ART. III. The association shall be composed of fellows and honorary members.

ART. IV. All members shall be chosen by ballot ; nomination for membership shall first be submitted to the Board of Directors ; if approved by them, the names shall be presented to the association, and for election the affirmative votes of four fifths of the members present shall be necessary. Each fellow shall pay annually \$2, or \$20 at some one time.

ART. V. Fellows only shall be entitled to vote, but honorary members shall have the right to sit and deliberate in all the meetings of the association.

ART. VI. The officers of the association shall be a president, five vice-presidents, a recording secretary, a corresponding secretary, a treasurer, a librarian, and three counselors, who, together with the president and secretaries, shall form a Board of Directors for the government of the institution, three of whom shall constitute a quorum at any meeting regularly convened. There shall be also three standing committees of three members each—*viz.*, on Publication, on Finance, and on the Library.

ART. VII. The association shall meet in the city of Boston on the third Friday in January, April, and October, and at such other times as the Board of Directors shall appoint. At the annual meeting in January the association shall hear reports of the Board of Directors, of the treasurer, of the librarian, and of the standing committees, elect officers, and transact other business. Vacancies may be filled at any regular meeting. Five members shall be necessary to form a quorum for transacting business and the election of members, but a less number may adjourn the meeting.

ART. VIII. No alteration in this constitution shall be made except on notice at a previous meeting, and by a vote of three fourths of the members present.

NOTE.—Each member shall be entitled to receive all reports and publications of the association.

Its presidents have been Hon. Richard Fletcher, A.M., LL.D. ; George C. Shattuck, M.D., LL.D. ; Edward Jarvis, A.M., M.D.

Its present officers (1895) are : President, Francis A. Walker, Ph.D., LL.D. Vice-Presidents, Hamilton A. Hill, A.M. ; Hon. Carroll D. Wright ; Richmond Mayo-Smith, A.M. ; Hon. Horace G. Wadlin ; Henry C. Adams, Ph.D. Correspond-

ing Secretary, E. R. L. Gould, Ph.D., Johns Hopkins University, Baltimore, Md. Treasurer, John S. Clark, Esq., 646 Washington Street, Boston, Mass. Secretary and Librarian, Davis R. Dewey, Ph.D., Institute of Technology, Boston, Mass. Assistant Secretary, Gary N. Calkins, Columbia College, New York. Counselors, John Ward Dean, A.M.; Samuel W. Abbott, M.D.; S. N. D. North, Esq. Committee on Publication, Davis R. Dewey, Ph.D.; Walter C. Wright, Esq.; Roland P. Falkner, Ph.D. Committee on Finance, Hamilton A. Hill, A.M.; Lyman Mason, A.M.; George O. Carpenter, Esq. Committee on Library, Hon. Julius L. Clarke; Rev. Robert C. Watterston; Rev. Samuel W. Dike, LL.D. (See also AMERICAN SOCIAL SCIENCE ASSOCIATION and INTERNATIONAL STATISTICAL INSTITUTION.)

AMSTERDAM, BANK OF. See BANK OF AMSTERDAM.

ANABAPTISTS, a name commonly given to that body of Christians who reject the baptism of infants and administer the rite only to adults. The doctrine first arose amid the discussions as to infant baptism which were held in the early Church. Thomas Munzer (1520), the leader of a set of enthusiasts called the prophets of Zwickau, did much to spread the beliefs of Anabaptism through Saxony and Switzerland. Waldshut became one of their centers of propagation. Revolting from the rigid rule of the State and from the false formalism of the Church, they carried their opposite principles too far; and it is certain that in some places the movement, guided by ambitious and licentious men, broke loose from all moral principles into lawlessness and lust; but for the most part Anabaptists have been a much maligned and misrepresented class of people, who earnestly desired and sought for a greater fullness of truth and brotherhood than any institutions then existing could provide. Their doctrines were: The equality of all Christians, the community of goods, the baptism of the Spirit, adult baptism, and the establishment of the kingdom of heaven on earth. About 1525 the "peasant war" broke out, partially caused and largely supported by these doctrines. The laboring classes were at this time very cruelly oppressed by the government, and the teachings of Anabaptism spread rapidly through Holstein, Westphalia, and the Netherlands. Again and again they were checked, and scattered, and persecuted even to death; but traveling preachers continued the agitation, and organizations sprang up wherever persecution turned its back.

In 1534 they became masters of Münster; they destroyed all churches, and appointed 12 judges to rule over the city. A tailor named Bockhold had himself crowned king, and for a year the city was given over to every kind of madness and licentiousness. At

the end of that time several Protestant princes conquered the city and restored peace and order by executing the ringleaders of the uproar. In Amsterdam and other cities Anabaptists, who had little in common with the lustful fanaticism of Bockhold, began to spread their doctrines. The *Revelations of St. John*

was their chief source of doctrine; and their main desire was to found a new kingdom of pure and primitive Christians. David Joris (1501-56), one of the chief of these, united Liberalism with Anabaptism, introduced much mystical theology, and strove to unite the different Christian sects. Another prominent leader was Merno Simons. In spite of dangers and persecutions he gathered together the scattered and disheartened Anabaptists of Germany and the Netherlands. He explained his belief in a book published in 1556, *Elements of the True Christian Faith*, which is still an authoritative book among the Mennonites. His adherents believe in strictly following the teachings of Scripture, in rejecting the taking of oaths, every kind of revenge, war, divorce (except for adultery), infant baptism, and the undertaking the work of a magistrate. Their belief is that while magistracy is necessary for the present time, it is foreign to the kingdom of Christ. The education and theology of the colleges they set very little value upon. Menno called his adherents "God's congregation; poor unarmed Christian brothers." In Germany the Mennonites are called *Taufgesinnte*, and in Holland, *Doopsgezinden*.

The church is the literal communion of the saints, which must be kept pure by strict discipline. They are Universalists in regard to grace and Zwinglians in their view of the Lord's Supper. They celebrate the rite of feet-washing. Their bishops, elders, and teachers serve gratis. They are split into many divisions, mainly the strict and the mild Mennonites. The latter are known as Waterländers, from a place in Holland. Some of their divisions take names from the peculiarities of their dress—Buttoners, Hook-and-eye-ers, etc. The purity of their lives, however, commands respect, and their industry makes them prosperous.

ANARCHISM (Gr. *an*, privative, and *ἀρχή*, government), the social doctrine of the abolition of government of man by man, and the constitution of society without government.

Under this general definition of anarchism there are, however, two schools of anarchists, so totally distinct and even opposed in their doctrines, their methods, and general characteristics, that we must consider them separately and distinguish between them at every point. The two schools are those of the individualist anarchists (often called in this country philosophical anarchists), and, secondly, the school of anarchist communists. The individualist anarchists, though perhaps the fewer in number, are, in this country especially, the abler body of thinkers, and carry out to their fullest logical results the principles which a great many individualists accept but do not fully carry out. Individualist anarchists do not believe in the use of force—not because they hold that it is wrong to use it, but simply because they are aware that the use of force never truly liberates, while their aim is absolute liberty—their motto being "Liberty, not the daughter, but the mother of order." They

start from the philosophy of individual sovereignty, and apply it to the problems of social science with relentless logic. While by no means objecting to organization and cooperation, provided it be voluntary, they would have all organization spring from the individual.

Anarchist communists, on the other hand, form a wholly different school of thought. They do not believe in government, and they do believe in overthrowing it by force. On its ruins they would plant a communal life, whose ideal is very little different from that of the socialists, except that it is not to be realized through the State. Most of the men who are called anarchists in the press, particularly of Europe, and almost all the bomb-throwers and dynamiters of recent years on either continent have been anarchist communists. The school is mainly European, as individualist anarchism is mainly American. Anarchist-communism counts among its followers names favorably known to science and letters, such as Krapotkin and Reclus, while many, even of the dynamitards, have been men of education and sometimes refinement. Nevertheless, it is mainly a movement among the working classes, particularly of France, Italy, Spain, and, to a less extent, Germany and Austria. In England there are but few anarchist communists. In America they are found only in a few cities. The so-called Chicago anarchists were anarchist communists. Individualist anarchism, on the other hand, is not a class movement, but almost purely intellectual, naturally drawing its strength largely from the classes possessed to-day of intellectual advantages. It will thus be seen that in philosophy, method, and general characteristics the two classes of anarchists are carefully to be distinguished. Both are distinctly revolutionary and opposed to the State; but the one starts from the individual, and advocates a revolution through ideas; the other starts from the community, and advocates a revolution through force. We print a statement of individualist anarchism by Victor Yarros, one of its foremost American representatives; and a statement of anarchist communism, by Pierre Krapotkin, perhaps its most distinguished representative. Says Mr. Yarros:

I. INDIVIDUALIST OR PHILOSOPHICAL ANARCHISM.

The individualistic or philosophical anarchists favor the abolition of "the State" and government of man by man. They seek to bring about a state of perfect freedom—of anarchy. To comprehend the precise import of this statement it is essential to grasp and bear in mind the definitions given by the anarchists to the terms employed in their expositions. The current misconceptions of the anarchistic doctrines are chiefly due to the persistent, though largely unconscious, habit of interpreting them in the light of the popular definitions of the terms "State," "government," etc., instead of in the light of their own technical use of these terms. The average man, on being told that the anarchist would abolish all governmental restraints, not unnaturally concludes that the proposition involves the removal of the restrictions upon *criminal* conduct, the relinquishment

of organized defense of life, liberty, and property. Those who are familiar with the doctrine of non-resistance to evil, preached by the early Christians and by the modern Tolstoians, generally identify anarchism with it. But such interpretations are without any foundation. The anarchists are emphatically in favor of resistance to and organized protection against crime and aggression of every kind; it is not greater freedom for the criminal, but greater freedom for the non-criminal, that they aim to secure; and by the abolition of government they mean the removal of restrictions upon conduct intrinsically ethical and legitimate, but which ignorant legislation has interdicted as criminal. The anarchistic principle of personal liberty is absolutely coincident with the famous Spencerian "first principle of human happiness," the principle of "equal freedom," which Mr. Spencer has expressed in the formula, "Every man is free to do what he wills, provided he infringes not the equal freedom of any other man." It is, in fact, precisely *because* the anarchist accepts this principle without reservation, and insists on the suppression and elimination of *all* aggression or invasion—all conduct incompatible with equality of liberty—that he declares war upon the "State" and "government." He defines "State" as "the embodiment of the principle of invasion in an individual or band of individuals, assuming to act as representatives or masters of the entire people within a given area."* Government he defines as "the subjection of the non-invasive individual to an external will;" and "invasion" as conduct violative of equal freedom.

Perhaps the clearest way of stating the political program of the anarchists will be to indicate its relation to other better known theories of government. The anarchists, agreeing with the view of the true Jeffersonian Democrats, that the best government is that which governs least, sympathizing with the position of the old Manchester individualists and *laissez-faire-ists*, who believed in a minimum of government interference, as well as with the less vague doctrines of the more radical modern individualists of the Spencerian school, who would limit the State to the sole function of protecting men against external and internal invaders, go a step farther and demand the dissolution of what remains of "government"—*viz.*, compulsory taxation and compulsory military service. It is no more necessary, contend the anarchists, that government should assume the protective military and police functions, and *compel* men to accept its services, than it is that government should meddle with production, trade, banking, education, and other lines of human activity. By voluntary organization and voluntary taxation it is perfectly possible to protect liberty and property and to restrain crime. It is doubtless easy to imagine a society in which government concerns itself with nothing save preservation of order and punishment of crime, in which there are no

Program.

* The definitions here given are those formed and consistently used by Benjamin R. Tucker, the editor of *Liberty*, the organ of the philosophical anarchistic movement.

public schools supported by compulsory taxation, no government interference with the issue of currency and banking, no custom-houses or duties on foreign imports, no government postal service, no censorship of literature and the stage, no attempt to enforce Sunday laws, etc. The *laissez-faire-ists* of the various schools have familiarized the thinking public with such a type of social organization. Now, the anarchists propose to do away with the compulsory feature of the single function reserved for government by the radical *laissez-faire-ists*. In other words, they insist on the right of the non-aggressive individual to "ignore the State," to dispense with the protective services of the defensive organization and remain outside of it. This would not prevent those who might desire systematic and organized protection from combining to maintain a defensive institution, but such an institution would not be a government, since no one would be compelled to join it and pay toward its support. Anarchy, therefore, may be defined as a state of society in which the non-invasive individual is not coerced into cooperation for the defense of his neighbors, and in which each enjoys the highest degree of liberty compatible with equality of liberty.

With regard to the question of putting down aggression, the jurisdiction of the voluntary defensive organization would of course extend to outsiders, and not be limited by its membership. The criminal are not to secure immunity by declining to join defensive associations. As the freedom of each is to be bounded by the equal freedom of all, the invader would be liable to punishment under anarchism no less than under government. Criminals would still be tried by juries and punished by executive officers. They would not be allowed to set up ethical standards for themselves and to do what is right in their own eyes. Such a doctrine involves not the *abolition* of government, but the widest possible extension of it. It repudiates all ethical principles and abandons all attempts at enforcing justice and protecting rights. Every man is allowed under it to govern his fellows, if he has the will and the power, and the struggle for existence in the simplest and crudest form is revived. Anarchism, on the other hand, posits the principle of equal liberty as binding upon all, and only insists that those who refrain from violating it should not be interfered with in any way, either by individual governors or combinations of would-be rulers.

Anarchists reject governmentalism because they find no ethical warrant and no practical necessity for it. It appears to them self-evident that society, or the community, can have no greater claims upon the individual than the component members of it have. The metaphysical and misleading analogies between society and organism, upon which is usually founded the governmentalist's theory of the prerogatives of the State, anarchists reject with undisguised contempt. "The community," or "the State," is an abstraction, and an abstraction has neither rights nor duties. Individuals, and individuals only, have rights. This proposition is the corner-stone of the anarchistic doctrine, and those who accept it

are bound to go the full length of anarchism. For if the community cannot rightfully compel a man to do or refrain from doing that which private and individual members thereof cannot legitimately force him to do or forego, then compulsory taxation and compulsory cooperation for any purpose whatever are wrong in principle, and government is merely another name for aggression. It will not be pretended that one private individual has the right to tax another private individual without his consent; how, then, does the majority of the members of a community obtain the right to tax the minority without its consent? Having outgrown the dogma of the divine right of kings, democratic countries are unconsciously erecting the dogma of the **Government** divine right of majorities to rule. **Aggression.** The absurdity of such a belief is apparent. Majorities, minorities, and any other combinations of individuals are entitled to insist on respect of their rights, but not on violating the rights of others. There is one ethical standard, not two; and it cannot be right for government to do that which would be criminal, immoral, when committed by individuals. Laws of social life are not made at the polls or in legislative assemblies; they have to be discovered in the same way in which laws of other sciences are discovered. Once discovered, majorities are bound to observe them no less than individuals.

As already stated, the anarchists hold that the law of equal freedom, formulated positively by Spencer and negatively by Kant, is a scientific social law which ought to guide men in their various activities and mutual relations. The logical deductions or corollaries of this law show us at once our rights and our duties. Government violates this great law not only by the fact of its very existence, but in a thousand other ways. Government means the coercion of the non-invasive, the taxation of those who protest against being forced to join the political organization set up by the majority. It enacts statutes and imposes restraints which find no sanction in the law of equal freedom, and punishes men for disobeying such arbitrary provisions. It is true that governments profess to have the public welfare in view, and to enforce nothing save what morality and justice dictate. Justice, however, is invariably confounded by governments with legalism, and by the enforcement of justice they often mean the enforcement of the very laws which they enact in violation of justice. Thus laws in restraint of trade and of exchange are enforced in the name of justice, whereas justice demands the fullest freedom of trade and exchange. Strictly speaking, the enforcement of justice cannot be undertaken by government at all, since a government that should attempt to enforce justice would have to begin by signing its own death-warrant. A government that would enforce equal freedom and let the inoffensive alone would be, not a government, but a voluntary association for the protection of rights.

In republican countries men loosely speak of their "free government," their "government by consent." In reality there is no such thing as government by consent. Majorities rule, and the minorities are forced to acquiesce.

Arguments for Anarchism.

The principle of consent is clearly fatal to governmentalism, for it implies the right of the non-invasive to ignore the State and decline to accept its services. Ethically a man has a perfect right to do this, for the mere refusal to join the political organization (which is merely an insurance association) is not a breach of the principle of equal freedom. Our "free governments" deny this right, hence they are immoral. They cannot become moral except by ceasing to be governments and becoming purely voluntary associations for defense.

Apart from the question of compulsory taxation and compulsory military service, on the abolition of which anarchists alone lay stress (although they readily admit that the police functions of government will be the last to disappear), there is little, if any, difference between anarchists and Spencerian individualists on the question of government interference. The cessation of such interference with economic relations—with the issue of money, banking, wages, trade, production, etc.—is advocated on the ground that the solution of the social problems is to be found in liberty rather than in regulation, in free competition rather than in State monopoly. On the subject of public education, postal service, poor laws, sanitary supervision, etc., anarchists, in common with advanced individualists, hold that government interference is as pernicious practically as it is unwarranted ethically. Corruption and inefficiency are evils inseparable from government management, and there is nothing which government does that could not be done better by private enterprise under free competition.

In short, the anarchists object to government-alism because it is unethical, as well as unnecessary and inexpedient. Government is either the will of one man or the will of a number of men, large or small. Now, the will of one or many is not a criterion of right and justice, while for the adjustment of the conflicting interests of the members of society such a criterion is an absolute necessity. Majority rule, and even the rule of a despot, may be, under certain conditions, preferable to a state of civil chaos; but as men advance and study the facts of their own development, they begin to realize the truth that there is no relation whatever between right

and numbers, justice and force. Majority rule is discredited along with despotic rule, and ethical science becomes the sole guide and authority. The social laws require to be applied and enforced as long as predatory instincts and invasive tendencies continue to manifest themselves in human relations, and this necessitates the maintenance of associations for the protection of freedom and the punishment of aggression. But the governmental method is not adapted to the promotion of this end. Government begins by coercing the non-invasive individual into cooperation for defense and offense, regardless of the fact that a benevolent despotism is not a whit more defensible than a selfish despotism.

In general, it may be stated that any methods not in themselves invasive are regarded as legitimate by the anarchists in the furtherance

of their cause. But they rely chiefly, if not entirely, on the methods of education—theoretical propaganda of their views—and of passive resistance to government. In violence, so-called propaganda by deed and subterranean plotting against existing institutions, they do not believe. **Methods.**

Political changes may be brought about by revolutions, and possibly also such economic changes as are contemplated by the State socialists. But freedom can rest only on ideas and sentiments favorable to it, and revolutionary demonstrations can never abolish ignorance and the spirit of tyranny. Freedom cannot be forced on those who are not fit for it. The emancipation of the people from the aggression of government must come through their own deliberate choice and effort. Anarchists can but disseminate true political teachings and expose the nature and essence of governmentalism. Anarchists, however, do not believe that it is necessary to convert the whole people in order to carry their principles into practice. A strong and determined minority could, while remaining passive, successfully resist the attempt of government to tax them and otherwise impose its will upon them. Public opinion would not approve of a government campaign of violence against a number of intelligent and perfectly honest individuals banded together for the sole purpose of carrying on their legitimate activities and asserting their right to ignore injunctions and prohibitions having no authority from an ethical point of view.

Even if anarchists believed in the use of violent methods, and if they thought that violent resistance to government would hasten their emancipation, they would certainly resort to it, since it is not immoral or invasive to use force against invaders—there would be one important difference between them and other schools of reformers. Anarchists would not prevent others from living under government side by side with them, while other reformers seek to impose their schemes on the whole community in which they live. Thus the State socialists, in pursuance of their program of State monopoly of capital, intend to suppress all competition and all rivalry on the part of individual owners of capital. The anarchists, on the other hand, if allowed to remain outside of the governmental organization, would force no one to join them or follow their example. Still, as a matter of fact, anarchists abjure violence even in their own interests, vividly realizing the truth that the progress of justice and freedom is arrested in a state of war. Peace is an essential condition to the spread of rational ideas and the growth of the sentiment of toleration. Appealing as they do to the ideas and feelings of justice, it would be suicidal for anarchists to encourage violence and excite the lowest passions of men by revolutionary tactics.

To reform by ordinary political methods the anarchists are also opposed, at least under present conditions. As they do not seek any new positive legislation, they can expect nothing from politics. They demand the repeal of the legislation which improperly restricts men's freedom of action, and such repeal they cannot secure while being in a minor-

ity. Whether they would cooperate with other parties in attempting to carry specific measures of repeal, would depend largely on circumstances. It is to be remembered that, while the anarchists are strenuous in their opposition to every vestige of government, they do not expect to realize their entire program at one stroke. They are prepared for very slow and gradual reform, and would welcome the success of any single libertarian proposal. They would rejoice in the triumph of the free-trade idea, the repeal of the laws perpetuating land monopoly and monetary monopoly, and the abolition of special privileges. If they do not form themselves into a political party for the purpose of attaining one or more of these objects, it is because they can do more by other methods. Moreover, to enter into the political arena is to recognize, by implication, the principle of government. To vote is to coerce or to threaten coercion. Behind the ballot is the bullet of the soldier, ready to force the defeated minority into submission. The voter does not merely assert his right to self-government; he sets up a claim to govern others. The anarchist cannot employ a method which would put him in such a false light.

Thus the anarchist is neither a government bomb-thrower nor a revolutionary bomb-thrower. He objects to the use of violence by the government as well as against it. He restricts himself to the method of education and such passive resistance as is exemplified by a refusal to pay taxes or rent or import duties on commodities purchased in foreign countries.

VICTOR YARROS.

Historical Sketch of Individualist Anarchism.

Philosophical anarchists usually regard Proudhon as the founder of their school of social science; but there were in America, altho far less widely known, men entertaining anarchistic views before Proudhon's time. We will, therefore, first notice the anarchist movement in America, and then consider it in other countries. America, or at least the United States, with its early extreme individualism and fear of the State (see CENTRALIZATION), was the fitting birthplace of anarchistic thought.

Josiah Warren, a plain and only moderately educated New Englander, but of unusually independent and earnest spirit, was probably the first to enunciate precise anarchistic conceptions. He had become interested in the social views and plans of Robert Owen (*q.v.*), at this time first taking root in the land; had joined the Owenite community at New Harmony; had carefully studied its principles and mused upon its failure, till finally, about 1828, he reached the conclusion that its principles were exactly the opposite of the true ones, and that, instead of the communistic idea of each working for all, as Owen taught, the true way to produce order, harmony, and well-being, was for each to live, in his own way, absolutely untrammelled by others, so far as he did not intrude upon the similar privileges of others. His thoughts took especially a financial turn, and he came to the conclusion that cost was the true limit of price; that usury and profit in all their forms were, therefore, economically wrong, and, moreover, that they would disappear under perfectly free competition. He sought to put his ideas into practice, to actually test them before giving them to the world, and therefore started, and for two years successfully carried on, a store in Cincinnati, where cost was the limit of price, and where usury and profit were eliminated. Finding that he was doing a business of \$150,000 a year—a large amount for Cincinnati in those days—he was convinced of the practicality and correctness of his idea, and therefore closed his business to devote his life to the propagation of his ideas. His main writings were *True Civilization*, a short work, first published in 1846, and *Equitable Commerce*,

in which he elaborated his ideas of cost as the limit of price. These books found at least a few thoughtful readers. Stephen Pearl Andrews declared at a later day that the *True Civilization* was the text and basis of all his own writings, and John Stuart Mill refers to Warren with expressions of deepest interest and respect.

Others, however, were thinking in the same line. Lysander Spooner, who has but recently passed away, may be called the Nestor of anarchism, of the extreme individualistic school. Commencing public life as a young lawyer in Worcester, Mass., he first showed strong analytic and argumentative powers in several pamphlets defending Deism against Christianity, but soon passed more and more into sociological studies and controversy, coming to hold and defend extreme views as to individual sovereignty and the tyranny of the State. As early as 1844 he established a private mail between Boston and New York, and later extended it to Philadelphia and Baltimore, achieving success, until at last compelled to stop, owing to petty and constant persecution and annoyance from the Government. From that time he devoted his great abilities to the promulgation of his ideas. During the anti-slavery contest he did good work as an abolitionist, and incorporated his views in *The Unconstitutionality of Slavery*. His legal acumen appears in his *Trial by Jury*, in which he reverts to the early and true meaning of the phrase—a trial by one's peers; and protests against the absurd and monstrous system (as he claims it to be) of ignorance and injustice now passing under that name. How far he carried his ideas appears in an unsigned monograph from his pen, entitled *Revolution*.

Stephen Pearl Andrews was a disciple of Warren. As Warren especially studied economic questions, so Andrews studied the family and marriage. His *Science of Society*, published in 1850, is still considered by philosophical anarchists a classic on the subject. Warren himself declared it a better statement of his own ideas than he himself could write. (For further account, see ANDREWS.)

We now first come to the influence of Proudhon in America, Colonel William B. Greene, of Boston, being the first in this country known to have declared himself a follower of the great Frenchman. Colonel Greene's book on *Mutual Banking* is one of the most acute and searching inquiries into the monetary problems to be found in the literature of the subject. Colonel Greene was a keen, logical thinker and a profound scholar. He was a remarkably witty speaker and writer, and his book, entitled *Socialistic, Communistic, Mutualistic, and Financial Fragments*, shows his power and versatility. E. H. Heywood, a writer on various subjects, was another disciple of Warren. He is the author of a number of very able pamphlets. Charles T. Fowler, also a disciple of Warren, was a Unitarian minister when he first fell under the influence of Warren. He studied Proudhon, and after leaving the church, devoted himself to the propaganda of anarchistic doctrines. He died a few years ago, leaving an admirable series of pamphlets on social and economic problems.

These men, however, while holding essentially anarchist views, and contributing, severally, to the development of anarchism in the United States, did not adopt the name anarchist, and did not really start the movement which has taken such definite shape under that distinctive denomination. The man who, assimilating and profiting by the teachings of Proudhon, Warren, Greene, and the American and English individualists, formulated a consistent and comprehensive anarchistic philosophy, and started the practical anarchistic movement, is Benjamin R. Tucker, the editor of *Liberty*, the organ of anarchism. Mr. Tucker was a young man, a student of the Massachusetts Institute of Technology, when he, becoming interested in social reform, sought the acquaintance of Warren and Greene. The latter called his attention to Proudhon's *What is Property?* and so impressed was he with the originality and value of that revolutionary (in an intellectual sense) and epoch-making work, that he set himself the task of translating it into English. No work has ever enjoyed the privilege of a more competent rendering into another language. The vigor and eloquence of Proudhon's style was fully preserved in the translation, and to this is due a large share of the influence exerted by Proudhon's work in America and England. A few years later Mr. Tucker started his paper, *Liberty*, which has been for more than a decade the recognized authority on anarchism. Mr. Tucker does not strictly

Other
Americans.

Present
Writers.

follow Proudhon, any more than he strictly follows Warren. He rejects the inconsistencies of the former as he does the crudities of the latter. He may be said to have organized the various anarchistic ideas—economic, political, etc.—into a coherent and systematic whole. Where Proudhon was vague and Warren inadequate, Mr. Tucker is clear, logical, consistent, and scientific. Mr. Tucker has influenced a considerable number of able men in journalism and other professions, as well as some of the prominent men in the labor movement. We will only mention here the name of Dyer D. Lum, one of the leaders of the early Greenback movement, who died a few years ago. Mr. Lum, while sympathizing to some extent with the methods of revolutionary reformers, was for several years before his death a vigorous and scholarly champion of the economic and political ideas of anarchism.

The growth of anarchism has not been rapid, and its history is not eventful or sensational. Its indirect influences, however, have wrought great changes in social science and in the intellectual attitude of sociologists and reformers.

In Europe, the real history of philosophic anarchism begins with Proudhon. (For a fuller notice of his life and teachings, see PROUDHON.) We study him here but in brief, in relation to the movement of anarchism. Born in 1809, after a bitter personal experience with poverty and ill-paid work, he published in 1840 his great work, *What is Property?* Of this

an admirer says: "He first with genius, and with learning and acumen rarely equalled, pleaded for absolute liberty of the individual and the doing away of all government. Property in its modern sense he showed to be not the product of individual labor on the part of the owner of the property, but the product of the labor of others, taken from them by legalized wrong, or by aid of monopolies and class legislation created by the State. Hence the truth of his celebrated sentence, 'Property is theft.'" The cure, he argued, was to do away with all government, and then each individual could retain that which he had produced, so that justice and order and well-being would be the result of liberty."

The book exposed him to new persecution from the Government and learned societies, which continued more or less to his death in 1865. He passed much of his life, banished from France, in Belgium. Yet he was ever active and at times popular in France. He was elected in 1848 to the Constituent Assembly by 77,000 votes, which, together with his frequent imprisonments and banishments, as well as the suppression of books, shows his power and influence in his generation. Yet few followed him understandingly. Proudhon himself declared that even those who voted for him did not understand his views. He believed that in America (as seems to be the case) his thoughts would first take root. His principal writings besides the above named are: *The Creation of Order in Humanity* (1843); *A System of Economical Contradictions* (1848); *Justice in the Revolution and in the Church* (1858); *Justice* (revised edition, 1859-60).

Proudhon was right; few followed him understandingly. The movement that sprang from his teachings has in the main, in Europe, been anarchist communism, which is no more like philosophic anarchism than Proudhon was like Bakounin. The real followers of Proudhon and philosophical anarchism, in Europe, can almost be counted on one's fingers, tho their influence has been more marked than this might seem to indicate.

In Germany Caspar Schmidt, better known under his *nom de plume* of Max Stirner, laid what some regard as the ethical foundations of anarchism in his *Der Einzige und sein Eigentum* (1845). John Henry Mackay, a Scotchman by birth, but with a German mother, and brought up in Germany from boyhood, has developed philosophic anarchism in poems, a novel (*The Anarchists*, translated into English, 1891), and other works. In England philosophic anarchism under this name has had scarcely any development at all; but perhaps this is only because so much of its individualism, of which there has been considerable development, has come so near to philosophic anarchism in such writers as Herbert Spencer, Auberon Herbert, Wordsworth Donisthorpe, Thomas Mackay, Frederick Millar, and others. A notice of the first three will be found under each name.

II. ANARCHIST COMMUNISM.

The following statement of anarchist communism is abridged from a tract on *The Place*

of Anarchism in Socialistic Evolution, by Pierre A. Krapotkin:

"All things belong to all, and provided that men and women contribute their share of labour for the production of necessary objects, they are entitled to their share of all that is produced by the community at large. 'But this is communism,' you may say. Yes, it is communism, but it is the communism which no longer speaks in the name of religion or of the State, but in the name of the people. . . . The tendency of this closing century is toward communism, not the monastic or barrack-room communism formerly advocated, but the free communism which places the products reaped or manufactured in common at the disposal of all, leaving to each the liberty to consume them as he pleases in his own home.

"This is the solution of which the mass of the people can most readily take hold, and it is the solution which the people demand at the most solemn epochs. In 1848 the formula 'From each according to his abilities, to each according to his needs' was the one which went straight to the heart of the masses, and if they acclaimed the republic and universal suffrage, it was because they hoped to attain to communism through them. In 1871, also, when the people besieged in Paris desired to make a supreme effort to resist the invader, what was their demand? That free rations should be served out to every one. Let all articles be put into one common stock and let them be distributed according to the requirements of each. Let each one take freely of all that is abundant, and let those objects which are less plentiful be distributed more sparingly and in due proportions—this is the solution which the mass of the workers understand best. This is

also the system which is commonly practised in the rural districts of France. So long as the common lands afford abundant pasture, what commune seeks to restrict their use? When brushwood and chestnuts are plentiful, what commune forbids its members to take as much as they want? And when the larger wood begins to grow scarce, what course does the peasant adopt? The allowing of individuals.

"Let us take from the common stock the articles which are abundant, and let those objects whose production is more restricted be served out in allowances according to requirements, giving preference to children and old persons—that is to say, to the weak. And, moreover, let all be consumed not in public, but at home, according to individual tastes and in company with one's family and friends. This is the ideal of the masses.

"But it is not enough to argue about 'communism' and 'expropriation'; it is furthermore necessary to know who should have the management of the common patrimony, and it is especially on this question that different schools of socialists are opposed to one another, some desiring authoritarian communism, and others, like ourselves, declaring unreservedly in favour of anarchist communism. In order to judge between these two, let us return once again to our starting point, the Revolution of the last century.

"In overturning royalty the Revolution pro-

claimed the sovereignty of the people ; but, by an inconsistency which was very natural at that time, it proclaimed not a permanent sovereignty, but an intermittent one, to be exercised at certain intervals only, for the nomination of deputies supposed to represent the people. In reality it copied its institutions from the representative government of England. The Revolution was drowned in blood, and, nevertheless, representative government became the watchword of Europe. All Europe, with the exception of Russia, has tried it, under all possible forms, from government based on a property qualification to the direct government of the little Swiss republics. But, strange to say, just in proportion as we have approached nearer to the ideal of a representative government, elected by a perfectly free universal suffrage, in that same proportion have its essential vices become manifest to us, till we have clearly seen that this mode of government is radically defective. Is it not, indeed, absurd to take a certain number of men from out the mass, and to intrust them with the management of *all* public affairs, saying to them, 'Attend to these matters ; we exonerate ourselves from the task by laying it upon you ; it is for you to make laws on all manner of subjects—armaments and mad dogs, observatories and chimneys, instruction and street-sweeping ; arrange these things as you please and make laws about them, since you are the chosen ones whom the people has voted capable of doing everything !' It appears to me that if a thoughtful and honest man were offered such a post he would answer somewhat in this fashion :

" You intrust me with a task which I am unable to fulfil. I am unacquainted with most of the questions upon which I shall be called on to legislate. I shall either have to work to some extent in the dark, which will not be to your advantage, or I shall appeal to you and summon meetings in which you will yourselves seek to come to an understanding on the questions at issue, in which case my office will be unnecessary. If you have formed an opinion and have formulated it, and if you are anxious to come to an understanding with others who have also formed an opinion on the same subject, then all you need do is to communicate with your neighbours and send a delegate to come to an understanding with other delegates on this specific question ; but you will

Argument. certainly reserve to yourselves the right of taking an ultimate decision ; you will not intrust your delegate with the making of laws for you. This is how scientists and business men act each time that they have to come to an agreement.'

" But the above reply would be a repudiation of the representative system, and nevertheless it is a faithful expression of the idea which is growing everywhere since the vices of representative government have been exposed in all their nakedness. Our age, however, has gone still further, for it has begun to discuss the rights of the State and of society in relation to the individual ; people now ask to what point the interference of the State is necessary in the multitudinous functions of society.

" Do we require a government to educate our

children? Only let the worker have leisure to instruct himself, and you will see that, through the free initiative of parents and of persons fond of tuition, thousands of educational societies and schools of all kinds will spring up, rivalling one another in the excellence of their teaching. If we were not crushed by taxation and exploited by employers, as we now are, could we not ourselves do much better than is now done for us? The great centres would initiate progress and set the example, and you may be sure that the progress realised would be incomparably superior to what we now attain through our ministries. Is the State even necessary for the defence of a territory? If armed brigands attack a people, is not that same people armed with good weapons the surest rampart to oppose to the foreign aggressor? Standing armies are always beaten by invaders, and history teaches that the latter are to be repulsed by a popular rising alone. While government is an excellent machine to protect monopoly, has it ever been able to protect us against ill-disposed persons? Does it not, by creating misery, increase the number of crimes instead of diminishing them? In establishing prisons into which multitudes of men, women, and children are thrown for a time, in order to come forth infinitely worse than when they went in, does not the State maintain nurseries of vice at the expense of the tax-payers? In obliging us to commit to others the care of our affairs, does it not create the most terrible vice of societies—indifference to public matters? . . .

" Let others, if they will, advocate industrial barracks or the monastery of authoritarian communism, we declare that the tendency of society is in an opposite direction. We foresee millions and millions of groups freely constituting themselves for the satisfaction of all the varied needs of human beings—some of these groups organised by quarter, street, and house ; others extending hands across the walls of cities over frontiers and oceans. All of these will be composed of human beings who will combine freely, and after having performed their share of productive labour will meet together, either for the purpose of consumption, or to produce objects of art or luxury, or to advance science in a new direction. This is the tendency of the nineteenth century, and we follow it ; we only ask to develop it freely without any governmental interference. Individual liberty ! 'Take pebbles,' said Fourier, 'put them into a box and shake them, and they will arrange themselves in a mosaic that you could never get by intrusting to any one the work of arranging them harmoniously.'

" Now let me pass to another part of my subject—the most important with respect to the future.

" There is no more room for doubting that religions are going ; the nineteenth century has given them their death-blow. But religions—all religions—have a double composition. They contain, in the first place, a primitive cosmogony, a rude attempt at explaining nature, and they furthermore contain a statement of the public morality born and developed within the mass of the people. But when we throw religions overboard or store them among our public rec-

No Need of the State.

ords as historical curiosities, shall we also relegate to museums the moral principles which they contain? This has sometimes been done, and we have seen people declare that as they no longer believed in the various religions, so they despised morality and boldly proclaimed the maxim of *bourgeois* selfishness, 'Every one for himself.' But a society, human or animal, cannot exist without certain rules and moral habits springing up within it; religion may go, morality remains. If we were to come to consider that a man did well in lying, deceiving his neighbours, or plundering them when possible (this is the middle-class business morality), we should come to such a pass that we could no longer live together. You might assure me of your friendship, but perhaps you might only do so in order to rob me more easily; you might promise to do a certain thing for me, only to deceive me; you might promise to forward a letter for me, and you might steal it, just like an ordinary governor of a jail. Under such conditions society would become impossible, and this is so generally understood that the repudiation

of religions in no way prevents public morality from being maintained,

Ethical Side. developed, and raised to a higher and ever higher standard. This fact is so striking that philosophers seek to explain it by the principles of utilitarianism, and recently Spencer sought to base the morality which exists among us upon physiological causes and the needs connected with the preservation of the race.

"Let me give you an example in order to explain to you what *we* think on the matter.

"A child is drowning, and four men who stand upon the bank see it struggling in the water. One of them does not stir; he is a partisan of 'Each one for himself,' the maxim of the commercial middle class; this one is a brute, and we need not speak of him further. The next one reasons thus: 'If I save the child, a good report of my action will be made to the ruler of heaven, and the Creator will reward me by increasing my flocks and my serfs,' and thereupon he plunges into the water. Is he, therefore, a moral man? Clearly not! He is a shrewd calculator, that is all. The third, who is an utilitarian, reflects thus (or at least utilitarian philosophers represent him as so reasoning): 'Pleasures can be classed in two categories, inferior pleasures and higher ones. To save the life of any one is a superior pleasure, infinitely more intense and more durable than others; therefore, I will save the child.' Admitting that any man ever reasoned thus, would he not be a terrible egotist? and, moreover, could we ever be sure that his sophistical brain would not at some given moment cause his will to incline toward an inferior pleasure—that is to say, toward refraining from troubling himself? There remains the fourth individual. This man has been brought up from his childhood to feel himself *one* with the rest of humanity; from his childhood he has always regarded men as possessing interests in common; he has accustomed himself to suffer when his neighbours suffer, and to feel happy when every one around him is happy. Directly he hears the heart-rending cry of the mother, he leaps into the water, not through reflection, but by

instinct; and when she thanks him for saving her child, he says, 'What have I done to deserve thanks, my good woman? I am happy to see you happy; I have acted from natural impulse, and could not do otherwise!'

"You recognise in this case the truly moral man, and feel that the others are only egotists in comparison with him. The whole anarchist morality is represented in this example. It is the morality of a people which does not look for 'the sun at midnight—a morality without compulsion or authority, a morality of habit. Let us create circumstances in which man shall not be led to deceive nor exploit others, and then by the very force of things the moral level of humanity will rise to a height hitherto unknown. Men are certainly not to be moralized by teaching them a moral catechism; tribunals and prisons do not diminish vice—they pour it over society in floods. Men are to be moralized only by placing them in a position which shall contribute to develop in them those habits which are social, and to weaken those which are not so. A morality which has become instinctive is the true morality, the only morality which endures while religions and systems of philosophy pass away.

"Let us now combine the three preceding elements, and we shall have anarchy and its place in socialistic evolution.

"Emancipation of the producer from the yoke of capital; production in common and free consumption of all the products of the common labour.

"Emancipation from the governmental yoke; free development of individuals in groups and federations; free organization ascending from the simple to the complex, according to mutual needs and tendencies.

"Emancipation from religious morality; free morality, without compulsion or authority, developing itself from social life and becoming habitual.

"The above is no dream of students, it is a conclusion which results from an analysis of the tendencies of modern society; anarchist communism is the union of the two fundamental tendencies of our society—a tendency toward economic equality and a tendency toward political liberty. **Fundamental**

So long as communism presented itself under an authoritarian form, which necessarily implies government, armed with much greater power than that which it possesses to-day, inasmuch as it implies economic in addition to political power—so long as this was the case communism met with no sufficient response. Before 1848 it could, indeed, sometimes excite for a moment the enthusiasm of the worker who was prepared to submit to any all-powerful government, provided it would release him from the terrible situation in which he was placed, but it left the true friends of liberty indifferent.

"Anarchist communism maintains that most valuable of all conquests—individual liberty—and moreover extends it and gives it a solid basis—economic liberty—without which political liberty is delusive; it does not ask the individual who has rejected God, the universal tyrant, God the king, and God the Parliament, to give unto himself a god more terrible than any

of the preceding—God the community, or to abdicate upon its altar his independence, his will, his tastes, and to renew the vow of asceticism which he formerly made before the crucified God. It says to him, on the contrary, 'No society is free so long as the individual is not so! Do not seek to modify society by imposing upon it an authority which shall make everything right; if you do, you will fail as popes and emperors have failed. Modify society so that your fellows may not be any longer your enemies by the force of circumstances; abolish the conditions which allow some to monopolize the fruit of the labour of others; and instead of attempting to construct society from top to bottom, or from the centre to the circumference, let it develop itself freely from the simple to the composite, by the free union of free groups. This course, which is so much obstructed at present, is the true, forward march of society; do not seek to hinder it, do not turn your back on progress, but march along with it! Then the sentiment of sociability which is common to human beings, as it is to all animals living in society, will be able to develop itself freely, because our fellows will no longer be our enemies, and we shall thus arrive at a state of things in which each individual will be able to give free rein to his inclinations, and even to his passions, without any other restraint than the love and respect of those who surround him.'

"This is our ideal, and it is the ideal which lies deep in the hearts of peoples—of all peoples. We know full well that this ideal will not be attained without violent shocks; the close of this century has a formidable revolution in store for us; whether it begins in France, Germany, Spain, or Russia, it will be a European one, and spreading with the same rapidity as that of our fathers, the heroes of 1848, it will set all Europe in a blaze. This coming revolution will not aim at a mere change of government, but will have a social character; the work of expropriation will commence, and exploiters will be driven out. Whether we like it or not, this will be done independently of the will of individuals, and when hands are laid on private property we shall arrive at communism, because we shall be forced to do so. Communism, however, cannot be either authoritarian or parliamentary, it must either be anarchist or non-existent; the mass of the people does not desire to trust itself again to any Savior, but will seek to organize itself by itself."

HISTORY AND METHODS OF ANARCHIST COMMUNISM.

Anarchist communism, tho more or less indebted to the thoughts of Rousseau, Proudhon, Ruge and others, owes its origin as a movement to the Russian Bakounin. Born of aristocratic and even princely parentage, Michael Bakounin, at first an officer in the Russian Army, threw up his commission at the age of 21, disgusted by the oppression of the Government and the consequent sufferings of the poor, and studied philosophy, reading Hegel and Schopenhauer in St. Petersburg and Berlin. Coming into revolutionary circles mainly under the influence of Arnold Ruge, who represented the extreme Hegelian left, Bakounin took part in the Dresden insurrection of 1848, and was arrested and condemned to death, but eventually handed over to the Russians and imprisoned in Schlüsselberg and in 1852 sent to Siberia. Hence, however, he eventually escaped, through Japan and the United States, and, in 1861, appeared in London, a revolutionist, declared by his enemies to be half-crazed by his years

of suffering and imprisonment. Be this as it may, he threw himself into revolutionary propaganda of every kind, mainly as an Internationalist, but sometimes inconsistently as a Pan Slavist, and occasionally as a Nihilist. Switzerland, Italy, and Southern France were the main scenes of his efforts, but he contrived to fill all Europe with his spirit of revolution. Gradually his utterances became wilder and his position more extreme. He commenced to preach the gospel of pandestruction. When the International (*q. v.*) was founded in London under the presidency of Marx in 1864, Bakounin did not at first connect himself with it. But later, realizing what capital could be made of it, he threw himself into the movement, and almost captured the International for anarchism. He did capture it in Italy, Spain, Southern France, Belgium, and to a large extent in Switzerland and other countries. In 1872, however, Marx as president contrived to have the congress of the International called at the Hague, where Bakounin could not come, since he was only secure in Switzerland, and would have been arrested in traversing any country through which he could have reached the Hague. At this congress, therefore, the adherents of Bakounin were defeated, and the General Council of the International was transferred to New York City. It resulted in the death of the International; but out of the split came the modern movements of democratic socialism and anarchist communism, economic schools which, altho previously to 1872 they had been more or less confounded, are now utterly distinct and even opposed. The ultimate ideals of the followers of Marx and Bakounin were not, however, so different. They both believed in communism, and communism was the early name for all socialism as well as for anarchist communism; but the split came in methods. The followers of Bakounin believed in destroying the State; Marx stood for capturing the State by legitimate political means, and through the State establishing the Social Democracy, or communism. Both opposed the present State; but one sought to overturn it at once by force, the other sought to capture it and use it. For a while it seemed doubtful which policy would win.

For a considerable time, the anarchist communists, especially in the southern countries, were stronger than the socialists. The working classes did not see the strength of the socialist programme. Anarchist communism, if it appealed less to their heads, appealed more to their instincts. It appealed to revolutionary deed. Words, its advocates declared, were cheap; it is the propaganda by deed that makes men think. The propaganda by deed has ever been the favorite policy among anarchist communists, being defended, though not practised, even by such men as Krapotkin and Reclus. But organization among anarchists has never prospered. Their policy lends itself to individual deed. Bakounin did not quietly accept his defeat by Marx at the Hague. He and his adherents called another congress in Switzerland, and declared that they were the true International. From this time anarchist communism had an organized existence. (For further details as to the preceding period, see BAKOUNIN; INTERNATIONAL.)

In 1876 Bakounin died, Elisée Reclus, Paul Brousse, and others gathering around his grave, ready to carry on his work. In October of the same year a congress was held at **Organization**. Berne, and enunciated the principles of anarchist communism, altho still under the name of socialism. It denounced even the Paris Commune, as not having entirely eliminated the principle of authority. At this congress two Italian delegates were present, Carlo Cafiero and Enrico Malatesta, and went home to head a revolution in April, 1877, in the Italian province of Benevento. They burnt the archives and laid their hands on what arms and money they could find, and distributed them to the people. The same year a congress was held at Verviers, where Krapotkin first appeared on the scenes under the name of Scrachoff. In 1878, Brousse and Krapotkin commenced publishing the *Avant Garde*, the first anarchist organ. The same year Nobelung and Hodel made their attack upon Kaiser Wilhelm at Niederwald; the cooper Broncasi attempted the life of Alphonso XII., and Passanante the life of the King of Italy, Humbert I. At a congress at Freiburg that year, a letter from Reclus made the following succinct statement of anarchist communism: "We are revolutionaries," he said, "because we desire justice. . . . Progress has never resulted from mere peaceful evolution; it has always been an outcome of a sudden revolution. The necessary preliminary preparation of the minds of men may be a gradual process; but the realization of their hopes comes abruptly and as a surprise. . . . We are anarchists, who recognize no one as

our master, as we are ourselves the masters of nobody. There is no morality without liberty. . . . We are also international collectivists, for we are aware that the very existence of human beings necessarily implies a certain social grouping." The congress voted for the appropriation by the community of all wealth, the abolition of the State, and even of any central administrative agency; and as regards means of propaganda, the congress favored the dissemination of anarchist ideas, and even rebellion and revolutionary deed. In 1879 the *Avant Garde* ceased to appear, and Krapotkin and others started a new paper, the *Révolution*, at Geneva (later moved to Paris). The same year Johann Most, expelled from Germany and driven from the socialist meetings, arrived in London, December, 1878, and in January, 1879, began publishing his paper, *Freiheit*.

In 1880 Ottero Gonzales attempted the life of Alfonso XII. At a congress in Switzerland of this year, Krapotkin advised the adoption of the name anarchist communism in the place of collectivism. In 1881 the French anarchists and socialists finally separated, and a congress of anarchists was held at London. Krapotkin was banished from Switzerland for his utterances; Most, in London, was sentenced to 16 months' hard labor for his words concerning the assassination of the Czar. At the close of 16 months he removed, with his paper, to the United States. There were outbreaks in southeast France, and many discoveries of dynamite plots were reported. Anarchists were arrested all through southern France. In the north, Louise Michel delivered a series of lectures. The daughters of Elisée Reclus ostentatiously contracted "free marriages." Krapotkin himself was arrested. In 1883 the anarchist trials in France took place, and 47 were sentenced, among them Louise Michel. All through Europe at this time anarchists were being arrested and sentenced. In Spain a campaign was undertaken against the Black Band. In December Vyvot was tried at Lyons for having caused the explosion at Bellecour Theatre, and was sentenced to death, but the sentence was commuted by President Grévy. The year 1884 was comparatively calm, though dynamite was found laid against the Federal Palace at Berne, and led to the expulsion of anarchists from Switzerland. In 1885 German anarchists were tried. Krapotkin published this year his *Paroles d'un Révolté* and Reclus his *The Products of the Earth*. An attempt was also made to blow up the English House of Parliament. In 1886 there were several riots in Europe, especially at Charleroi, and the great strike at Chicago took place, with the famous Haymarket meeting, the arrest of eight anarchists, and the condemnation of seven of them to death (in 1887). (See CHICAGO ANARCHISTS.) In 1887 *L'Idée Ouvrière* was started at Havre. In 1888

History.

the Père Peinard was started at Paris, a paper in the slang of the French streets. In 1889 Most, Malato, and Grave all issued anarchist pamphlets. In 1890 the first international May-day demonstration took place, and the anarchists took advantage of it in incendiary speeches and gatherings. Merlino, Malato, and Louise Michel were imprisoned. The *International*, an anarchist paper, was started in London. In 1891 the French anarchists agitated chiefly against the army and the police. At Levallois the black flag was unfurled. Several anarchist papers were started, the *Pot à colle* and the *l'En-dehors*. In 1892 bombs were exploded in France in private houses of deputies and at cafés, among others at the Café Rich. In June one of the dynamiters, Ravachol, was condemned to death, and executed in July. In 1893 there was more violence in Spain. Pallas was tried and executed for throwing a bomb at Marshal Campos at Barcelona, and there was also a terrible bomb explosion at the El Lyceo Theatre in Barcelona. On December 9, Vaillant threw a bomb in the French Chamber of Deputies. In 1894 severe laws against anarchists were passed in France and other countries; 100 anarchists were arrested in France alone and several deported. The papers *Révolution* and *Père Peinard* were seized and compelled to discontinue. Jean Grave, the leading anarchist communist after Krapotkin and Reclus, was imprisoned. Vaillant was executed. Émile Henry threw a bomb in the Café Terminus. Bombs were exploded also in the Hôtel St. Jacques and other houses. An attempt was made to murder the prefect of Barcelona. An Italian anarchist, Cesario Santo, assassinated the French President, Carnot, at Lyons. Restrictive legislation in Italy sought not only to arrest all anarchists, but to close all trade-union meetings. In Germany the Kaiser introduced severe measures against both anarchism and socialism, which have been, however, rejected by the Reichstag. Such is a brief sketch of the anarchist-communist movement. There is no general organization. Anarchists meet in little

groups, which are forever changing, dissolving, and reforming. Communication between groups is simply conducted through individuals. The party is without leaders. Anybody, even detectives, can easily join anarchist groups, but detectives learn little, for the groups as groups do nothing, and serve simply to bring individuals together. Thus the group that Vaillant belonged to did not know his project of throwing the bomb in the Chamber of Deputies. Till recently *Le Révolté* has been the chief literary and *Le Père Peinard* the chief popular organ; but these have disappeared without successors. In 1893 an attempt was made to hold an anarchist-communist congress in connection with the World's Fair at Chicago, but it had to meet surreptitiously on account of the police, and when it met its members could agree upon no program nor declaration of principles, though it is said that an international committee was chosen. In America anarchist communism has held on to the name of the old International. **America.** longer than in Europe. In 1872, as we have seen, the general council of the International was transferred at Marx's suggestion to New York City. But in this country it never thrived. The fundamental differences between the socialists and the anarchists soon showed themselves here, as in Europe. In 1877 the socialist wing, in a meeting at Newark, took the name of the Socialist Labor Party (see SOCIALISM), and practically left the International to the anarchists. The split, however, was not at once complete. In 1883 the socialists met at Baltimore and the anarchists at Pittsburg, and these took the old name of the International Working People's Association. By 1885 the split with the socialists was complete, and since then in America, as in Europe, anarchists and socialists have had nothing in common. The congress at Pittsburg adopted unanimously a manifesto or declaration of motives and principles, often called the Pittsburg proclamation, in which they describe their ultimate goal in these words:

"What we would achieve is, therefore, plainly and simply:

"1. Destruction of the existing class rule, by all means—i.e., by energetic, relentless, revolutionary, and international action.

"2. Establishment of a free society based upon cooperative organization of production.

"3. Free exchange of equivalent products by and between the productive organizations without commerce and profit-mongery.

"4. Organization of education on a secular, scientific, and equal basis for both sexes.

"5. Equal rights for all without distinction to sex or race.

"6. Regulation of all public affairs by free contracts between the autonomous (independent) communes and associations resting on a federalistic basis."

In 1881, however, another association was formed, designated by the initials I. W. A., or International Workmen's Association, differing in a few particulars only from the I. W. P. A. It lays greater stress on education and is somewhat less inclined to favor violence in the present, holding that a revolution in the minds of men must precede the political revolution. The following explanation of its principles and methods is taken from the *First Report of the Kansas Bureau of Labor Statistics*.

"To print and publish and circulate labor literature; to hold mass-meetings; to systematize agitation; to establish labor libraries, labor halls, and lyciums for discussing social science; to maintain the labor press; to protect members and all producers from wrong; to aid all labor organizations; to aid the establishment of unity and the maintenance of fraternity between all labor organizations; to bring about an alliance between the manufacturing and agricultural producers; to encourage the spirit of brotherhood and interdependence among all producers of every State and country; to ascertain, segregate, classify, and study the habits and acts of their enemies; to secure information of the wrongs perpetrated against them, and to record and circulate the same; to arouse a spirit of hostility against and ostracism of the capitalist press; to prepare the means for directing the coming social revolution by enlightening public opinion on the wrongs perpetrated against the producers of the world; to obliterate national boundary lines and sectional prejudices, with a view to the international unification of the producers of all lands; and to eradicate the impression that redress can be obtained by the ballot. The organization is formed on the "group" system—that is, any person who subscribes to these principles may become an organizer. He organizes a group of eight besides himself. When this group becomes thoroughly

conversant with the principles and methods of the organization, each member becomes an organizer and forms a group of his own; and this goes on indefinitely. North America is divided into 10 divisions—the Canadian, the British Columbia, the Eastern States, the Middle States, the Western States, the Rocky Mountains, the Pacific Coast, the Southern States, the Mexican, and the Missouri Valley. Each division is presided over by a division executive of nine persons. The International was organized on its present basis on July 15, 1881, with 54 delegates, representing 320 'divisions,' or groups, composed of 600,000 members. The countries represented were France, Belgium, Holland, Germany, Austria, Italy, Spain, Switzerland, Russia, Siberia, Bulgaria, Roumania, Turkey, Egypt, England, Mexico, and the United States."

It is the agitation of these groups of the I. W. A. and the I. W. P. A. which have produced what popular anarchistic communism there is in this country. But the movement has come to naught. The I. W. A. and the I. W. P. A. no longer exist save in the minds of a few half-crazed persons, and the only present activity is the publication of a paper and the occasional delivery of speeches by Most and others, which make "a good copy" for the newspapers. There have been also a few attempts of devoted but fanatical men to assassinate men of wealth and influence, like Frick and Russell Sage; but these acts have been very rare. When an agitator like Most speaks, he will often get a large audience, who will cheer his utterances, but the movement has no power.

Among English working men, too, there is little, if any, anarchism. The head of Oxford House, in East London, recently testified that there were no anarchists among the English working people and that the last place possible for a man to arrive with a bomb was East London. Among the foreign residents in London there are some anarchist clubs, and there is some anarchist communism among the intellectual radicals, but it has little force. The only countries in which anarchist communism at all thrives to-day are in the southern countries of Europe, under the despotism of Russia, and among some of the inflammable French and Belgians; but even in these countries it is giving place to the organized political movement of Social Democracy. It can only thrive on such governmental persecution as the Italian Government is now attempting against the whole labor movement.

ARGUMENTS AGAINST ANARCHISM.

I. The argument against individualist anarchism is, first, that it starts from a false basis. The individual, say the philosophical opponents of anarchism, is not sovereign; he does not even exist. Man is not born to and never attains, nor can attain, individual sovereignty. From his birth to his death he is dependent upon his fellow-man, and ever must be so long as he is a social being. Society is not made up of units, but is one; and the sooner this is realized, and man no longer attempts an impossible individual sovereignty, the sooner will the individual find his true freedom in developing his inmost personality in the unity of a perfect state. Anarchism is opposed thus, first, because it misreads the *facts* of individual life. Second, the opponents of anarchism assert that for anarchists to define the State as *necessarily* invasive, because States always have been more or less invasive, is to be illogical. The State, according to the anarchist's own admission, is a power, and has been, as at least most anarchists admit, in the past a necessary power. Why, then, throw away that power? Why—since some co-operative organization for defense and other purposes anarchists themselves declare necessary—not use the State, making it non-invasive? To say that the State cannot be harnessed to do the will of the people, because it never has been wholly so harnessed in the past, is as if a man before the discovery of the uses of electricity should declare that electricity always *must* be harmful, since it always had done harm. The

fact is, say these critics, that the State, with all its evils—and they are to be admitted, every one—has in the past been immeasurably useful and beneficial, and should not be thrown away, but captured and improved and made to do the will of freemen.

II. As to the anarchist assertion that States have no right, for example, to compel any man to pay a tax, since no individual has a right to tax another, and the mere multiplying individuals into a majority cannot make that right in many persons which is wrong in one, it is said that this is purely a doctrinaire position of unproven ethics. That it seems axiomatic and convincing to a certain class of minds by no means proves its truth. The opposite assertion that the individual is born in society, and has as his only right to take his place in society, which is a natural unit, and not made up of individual units, and has rights and duties of its own, among others that of ordering the conditions of society according to the will of the majority, and compelling others to support it, is, it is claimed, as plausible a dogma as the anarchist dogma, and a good deal more deducible from facts. The truth is, that the science of social ethics is as yet so utterly undeveloped that to talk of what is ethically right in society is to say nothing. One man holds this opinion; another that; and neither can convince the other. The only possible way out of social problems, unless one takes the religious ground of theism, and find in that a law of procedure, is to slowly learn by experience; believers in government, therefore, base their main arguments against anarchism on the facts of experience. They say:

III. It will not work. Said President Andrews, in a discussion with Mr. Tucker at Salem:

"Suppose the citizens of Salem to constitute an anarchistic group under the beautiful social compact which Mr. Tucker describes. Not many days will elapse before some of the parties to that compact will show how useless it is. Let some rioters from Beverly or Beverly Farms invade the Salem group. The foreman of the town calls all hands to turn out and put them down. One man replies that he does not care to come out; he has the rheumatism, or he is reading a book, or engaged in some other work, and says, 'I pray you, have me excused.' What is going to be done? I know of no way in which the anarchistic group named Salem can defend itself—as Mr. Tucker says is legitimate—except by coercing Meroz to come up to the help of the Lord against the mighty. The anarchist must here renounce his theory and resort to some of those species of action which Mr. Tucker denounces as not permissible because of the nature of coercion, aggression upon individual rights."

Says another writer: "Some rule there must be under any theory. You cannot escape law. If it is not the rule of brotherhood, it must be the rule of might. You do not escape rule by flying to anarchy. Says Mr. Donisthorpe, in his *Individualism: a System of Politics*: 'It is a mistake to suppose that anarchism is lawless. Nothing of the kind. Where there is no ruling body; where there is no governmental

Impracticable, say its Opponents.

authority, as in San Francisco within the memory of many of us, what happens? Did the marauders and pests of society carry all before them? Not a bit of it. Those who had inherited the habits of a social and methodical mode of life, owing to its greater average economy, banded themselves together and straightway lynched those who were desirous of violating the principles of order and method.' This, says Mr. Donisthorpe, was anarchism. Exactly; and most people prefer Uncle Sam, with all his faults, to Judge Lynch."

Concerning the economic impossibilities of anarchism, G. Bernard Shaw says:

"The full economic detail of individualist anarchism may be inferred with sufficient completeness from an article entitled *State Socialism and Anarchism: How far they agree, and wherein they differ*, which appeared in March, 1888, in *Liberty*.

"The economic principles of modern socialism,' says Mr. Tucker, 'are a logical deduction from the principle laid down by Adam Smith in the early chapters of his *Wealth of Nations*—*vis.*, that labor is the true measure of price. From this principle these three men [Josiah Warren, Proudhon, and Marx] deduced "that the natural wage of labor is its product."

Now the socialist who is unwary enough to accept this economic position will presently find himself logically committed to the Whig doctrine of *laissez-faire*. And here Mr. Tucker will cry, 'Why not? *Laissez-faire* is exactly what we want. Destroy the money monopoly, the tariff monopoly, and the patent monopoly. Enforce then only those land titles which rest on personal occupancy or cultivation,* and the social problem of how to secure to each worker the product of his own labor will be solved simply by every one minding his own business.'

"Let us see whether it will or not. Suppose we decree that henceforth no more rent shall be paid in England, and that each man shall privately own his house, and hold his shop, factory, or place of business jointly with those who work with him in it. Let every one be free to issue money from his own mint without tax or stamp. Let all taxes on commodities be abolished, and patents and copyrights be things of the past. Try to imagine yourself under these promising conditions with life before you. You may start in business as a crossing-sweeper, shopkeeper, collier, farmer, miller, banker, or what not. Whatever your choice may be, the first thing you find is that the reward of your labor depends far more on the situation in which you exercise it than on yourself. If you sweep the crossing between St. James' and Albemarle Streets you prosper greatly. But if you are forestalled not only there, but at every point more central than, say, the corner of Holford Square, Islington, you may sweep twice as hard as your rival in Piccadilly, and not take a fifth of his toll. At such a pass you may well curse Adam Smith and his principle that labor is the measure of price, and either advocate a democratically constituted State socialist municipality, paying all its crossing-sweepers equally, or else cast your broom upon the Thames and turn shopkeeper. Yet here again the same difficulty crops up. Your takings depend not on yourself, but on the number of people who pass your window per hour.

"It is useless to multiply instances. There is only one country in which any square foot of land is as favorably situated for conducting exchanges, or as richly endowed by nature for production, as any other square foot; and the name of that country is Utopia. In Utopia alone, therefore, would occupying ownership be just. In England, America, and other places, rashly created without consulting the anarchists, Nature is all caprice and injustice in dealing with labor. Here you scratch her with a spade; and earth's increase and foison plenty are added to you. On the other side of the hedge so steam-diggers will not extort a turnip from her. Still less adapted to anarchism than the fields and mines is the crowded city.

"Now Mr. Tucker's remedy for this is to make the occupier—the actual worker—the owner. Obviously

* See Mr. Tucker's article entitled *A Singular Misunderstanding in Liberty* of September 10, 1892. "Regarding Land," writes Mr. Tucker, "it has been steadily maintained in these columns that protection should be withdrawn from all land titles except those based on personal occupancy and use."

the effect would be not to abolish his advantage over his less favorably circumstanced competitors, but simply to authorize him to put it into his own pocket instead of handing it over to a landlord. He would, then, it is true, be (as far as his place of business was concerned) a worker instead of an idler; but he would get more product as a manufacturer and more custom as a distributor than other equally industrious workers in worse situations. He could thus save faster than they, and retire from active service at an age when they would still have many years more work before them. His ownership of his place of business would of course lapse in favor of his successor the instant he retired. How would the rest of the community decide who was to be the successor—would they toss up for it, or fight for it, or would he be allowed to nominate his heir, in which case he would either nominate his son or sell his nomination for a large fine?

To such problems as these individualist anarchism offers no solution. It theorizes throughout on the assumption that one place in a country is as good as another."

Such, in brief, is Mr. Shaw's argument. Anarchism aims to establish individual liberty; but as long as any occupier can have the best lands in agriculture and the best building lots, he can, under free competition, receive enormous gains over his competitor—can with these gains buy machinery that others cannot afford, and run his competitors out of business, re-enacting under anarchism all or most of the industrial evils that we have to-day—the development of great monopolies, the oppression of the small producer, wage slavery, the unemployed, etc. It is not government, but the natural inequalities of land and of human ability that are the fundamental source of the economic differences, and under competition the under dog must always serve the upper. The only way to individual freedom for all men is, then, to pool the difference of land and talent and have all work for all, which is collectivism. Such is, in brief, the "socialist" argument against anarchism.

IV. As to the anarchist communists, who are collectivists, it is said that for the poor, ignorant, and downtrodden to attempt to overthrow the State by force is but folly, no matter what the aim. To appeal to force will simply call out force, and the strong and rich and powerful will surely win. Moreover, to appeal to force without organization, as anarchist communists do, is to appeal to force in the weakest possible way. It may kill a few kings; it can never overthrow kingdoms. If it could overthrow the State it would simply produce a chaos, in which the strongest would rule and enact anything but equality on earth.

Tucker (New York, 1893), the fullest exposition of individualist or philosophical anarchism; *Anarchism: Its Aims and Methods*, by Victor Yarros, the best brief statement; *What is Property?* by P. J. Proudhon, translated by B. R. Tucker (1876); *System of Economical Contradictions*, by Proudhon; translated by Tucker (1888); Proudhon's *Complete Works* (33 vols., Paris, Lacroix, 1868-76); *Political Justice* (on property), by William Godwin, edited by Salt (London, Sonnenschein, 1891); *Free Political Institutions*, an abridgment of Lysander Spooner's *Trial by Jury*, edited by Victor Yarros, a book treating of the administration of justice under anarchism and showing the difference between a voluntary association and government; *The vindication of Natural Society*, the famous pamphlet written by Edmund Burke, the English statesman, in his radical days; *Social Statics*, first edition, by Herbert Spencer, which contains the chapter on *The Right of the Individual to Ignore the State*, omitted from recent revised editions; *The Economics of Anarchy*, by Dyer D. Lum; *A Politician in Light of Haven*, by Auberger Herbert, a plea for voluntary taxation and a criticism of government and politics; *A Letter to Grover Cleveland*

and *No Treason*, by Lysander Spooner, books showing that the United States Constitution is of no authority and that government is essentially tyrannical; *Mutual Banking*, by Colonel William P. Greene, a clear and admirable exposition of anarchistic finance. The best philosophical anarchist papers are first and foremost *Liberty* (edited and published by B. R. Tucker, Gold Street, P. O. box 1312, New York City, headquarters for all literature and information as to philosophical anarchism); *Lucifer*, a weekly (published by Moses Harman in Topeka, Kan.), and *Egoism*, a monthly (in Oakland).

ANARCHIST COMMUNISM: *God and the State*, by Michel Bakounin, translated by B. R. Tucker (Boston, 1883); *Appeal to the Young* (1890); *Coming Anarchy* (*Nineteenth Century*, 1887, vol. xxii., p. 149); *Law and Authority* (1886); *Paroles d'un Révolté* (1885); *Place of Anarchism in Socialistic Evolution* (1886); *Scientific Basis of Anarchy* (*Nineteenth Century*, 1887, vol. xxi., p. 238)—all by Prince P. A. Krapotkin; *Anarchy*, by an anarchist (1884), and *Evolution and Revolution*, by J. E. Reclus (London, Reeves, 1891); *Die Anarchie* (1888) and *Social Monster* (1890), by Johann Most (New York); *Anarchism: Its Philosophy and Scientific Basis*, by Albert R. Parsons (Chicago, 1887); *The Red International*, by Zaeker (1880); translated (London, Sonnenschein, 1886). For historical notices of anarchist communism, see *Contemporary Socialism*, by John Rae, revised edition; the *Anarchist Peril*, by Felix Dubois, translated by Ralph Derechiff (1894).

The present anarchist communist papers in this country are: Most's *Die Freiheit* (published weekly in New York City); *Der Anarchist*, the organ of the movement in New York City, also weekly; the *Chicagoer Arbeiter Zeitung*, a Chicago daily, with an especial Sunday edition, *Die Fackel*, and weekly edition, *Der Vorbote*. The principal editor of the *Chicagoer Arbeiter Zeitung* and the *Der Vorbote* is Robert Steiner; of *Die Fackel*, H. C. Bechtold. In England, *Freedom*, Mrs. C. M. Wilson's monthly (published at 26 Newington Green Road, London, N.), and *The Commonweal*, just restarted, with *Die Autonomie* (in German), represent communist anarchism. The best work against anarchism is *The Impossibilities of Anarchism*, by Bernard Shaw (Fabian Tract, No. 45).

ANDOVER HOUSE, THE, IN BOSTON.

—The Andover House commenced its work in January, 1892. The movement began among a group of the younger graduates of Andover Seminary who had been under the instruction of Professor William J. Tucker, now President of Dartmouth College. President Tucker himself first proposed the plan, and has all along been its leader.

The Andover House Association, which stands responsible for the work, has, however, represented from the beginning a large variety of persons having no identity of interest except that in the more progressive lines of social activity.

The House is located at 6 Rollins Street, in the south end of the city, which is destined to be the metropolitan poor quarter of Boston. The location was selected so as to allow the work to reach both ways—toward the better grades of working people and toward the laboring and casual classes.

In the first instance, the House is the home of a group of educated men, who in one way and another enter actively into all the better interests of the immediate neighborhood. The keynote of every effort is personal friendliness. As far as possible the attitude of patronage is completely avoided.

At the beginning the work of the House has necessarily had to be somewhat ill-defined. Indeed, the work of a university settlement can never take on the exact and highly organized form of an institution; however, the purpose of making the work regular and continuous is held

strongly in mind. The original purpose included not only well-meaning effort, but careful study of actual conditions to accompany and inform such effort.

As a rule, each resident visits a certain group of families and makes it his duty to become thoroughly acquainted with them. As he learns about the life of the families, not as a canvasser learns, but as a friend learns about a friend, he makes out a complete schedule, covering every significant point. There will thus be at the House in the course of a few years a body of accurate knowledge which will greatly aid intelligent action. Much time is also given to careful investigation of social problems, affecting the life of the city as a whole. In several instances, through such study, residents have done useful work in the way of the improvement and development of some of the larger forms of philanthropic work in Boston.

The residents cooperate with the various local agencies in the way of self-help, as well as of charity and philanthropy. They have participated in certain local societies of the people's own; they serve on a local committee of the associated charities; they act upon the managing board of different charitable institutions, besides rendering a large amount of irregular service in such causes; they cooperate as far as possible, according to their particular inclination, with the work of the churches in the neighborhood, tho they avoid the very appearance of proselytism; and this not merely as a matter of policy, but of principle.

It is held to be very important to do everything through cooperation with existing agencies that can be done in that way.

The House is not meant to be an institution foisted upon the neighborhood, but simply an influence which shall act in support and confirmation of such good influences as are already in action; thus, the House undertakes very little formal educational work, because the educational system of Boston, including evening elementary schools and the evening high school, so well fill the need in that particular.

The gatherings at the House, while they are by regular appointment, are very informal in their nature, beginning with recreation of various kinds, and leading always toward the mental and moral improvement of those who come.

There are clubs for boys and girls, for little children, for young men and young women, and there is a weekly meeting for mothers of the neighborhood; but in all these the numbers are small, and the effort is constantly to have the influence of a personal rather than a mechanical one. In connection with this work much aid is given by persons from other parts of Boston, both men and women.

The residents of the House and a number of other persons who are actively interested arranged two Free Art Exhibitions, held by permission, in 1895, in a large hall owned by the city. Each exhibition lasted for four weeks, including Sundays, and was attended by over 40,000 people.

ROBERT A. WOODS.

ANDREWS, ELISHA BENJAMIN, D.D., LL.D., President of Brown University, was

born at Hinsdale, N. H., January 10, 1844. He served in the United States Army from 1861-64, and rose from private to second lieutenant; he was wounded at Petersburg August 24, 1864, losing an eye. He graduated at Brown University, Providence, R. I., in 1870, and at Newton Theological Institute, Newton, Mass., in 1874; was principal of the Connecticut Literary Institution, Suffield, Conn., 1870-72; pastor of the First Baptist Church, Beverly, Mass., 1874-75; President of Denison University, Granville, O., 1875-79; Professor of Homiletics in Newton Theological Institution, 1879-82; Professor of History and Political Economy at Brown University, 1882-88; Professor of Political Economy and Finance in Cornell University, 1888-89; President of Brown University, 1889. President Andrews was appointed one of the commissioners sent by the United States to the monetary conference at Brussels in 1892. He is of the new or historical school. On the question of the tariff, he believes in the infant industry argument, and would carry it further than Mill. Industries being firmly established, Professor Andrews believes that protection and, if necessary, prohibition should be used to wage war upon injurious *foreign* monopolies, and free trade to wage war upon injurious domestic monopolies. A tariff commission will, he considers, be needed to arrange this. On questions of currency he is an ardent bimetalist. On questions of industry he would neither nationalize nor municipalize any industry, monopoly or otherwise, till every available resource in the way of regulation had been tried in vain; he would then nationalize or municipalize without hesitation, tho with care. He is the author of *Institutes of our Constitutional History, English and American* (1887); of *Institutes of General History* (1889); and of *Institutes of Economics* (1889); *An Honest Dollar* (1893); *Wealth and Moral Law* (1893); *History of the United States* (1894).

ANDREWS, STEPHEN PEARL, author, born in Templeton, Mass., 1812; died in New York City in 1886. Studying at Amherst College, he later removed to New Orleans, and became a lawyer. He was an ardent abolitionist, and in 1839 removed to Texas, where he converted many of the slave-owners, who were also land-owners, by showing them that they would become rapidly rich from the sale of land if immigration were induced by throwing the country open to free labor. His impetuous and logical eloquence gained him a wide repute and great personal popularity; but, on the other hand, his seemingly reckless and fanatical opposition to slavery aroused an intense feeling of opposition, and his life was seriously endangered. In 1843 he went to England in the hope that, with the aid of the British Anti-Slavery Society, he might raise sufficient money there to pay for the slaves and make Texas a free State. He was well received; but the plan was finally abandoned through fear that it would lead to war with the United States. Returning to America, he went to Boston and became a leader in the anti-slavery movement there.

While in England he learned of phonography, and after his return wrote and published exten-

sively on that subject and on the philosophy of language in general. He was the founder of the present system of phonographic reporting. He is said to have been familiar with 30 languages. He was a prominent member of the Liberal Club of New York, and for some time its vice-president. In later life he wrote more on sociology, especially on the family, taking an extremely individualistic position. He is claimed by the American philosophical anarchists as one of their great writers. (See ANARCHISM.) His most important works on that subject are: *Cost the Limit of Price* (New York, 1851); *The Constitution of Government in the Sovereignty of the Individual* (1851); *Love, Marriage, and Divorce, and the Sovereignty of the Individual*: a discussion by Henry James, Horace Greeley, and Stephen Pearl Andrews, edited by the latter (1853).

ANGLICAN POSITION IN POLITICAL AND SOCIAL REFORM, THE.—There is a church position in relation to political and social reform so different from either the accepted Protestant or Romanist positions that it is entitled to a presentation by itself. We call it Anglican, first, because it goes logically with that conception of the Church which is generally called Anglican, and, secondly, because it has been, as a matter of fact, most developed in the Church of England. Nevertheless, it is a conception by no means necessarily confined to the Anglican communion, and, as a matter of fact, many, perhaps the majority, of parishes of the Anglican communion do not hold to this position. What position in social reform *is* occupied by the Church of England and the Protestant Episcopal Church of the United States we consider under CHRISTIAN SOCIAL UNION, etc.; here we are concerned not with what they have done, but with a statement of a certain view of the relation of the Church to political and social problems. The position may be summed up in two points: *First*, that the only difference to be admitted between Christians, as far as organization goes, is one of *geography*, and, *secondly*, that in each geographical division the Church is responsible for the Christianizing of the whole secular as well as spiritual life of that division.

On the first point the holders of this view conceive of the Church not as a society formed by men who hold to particular articles of religion, but as a society founded by Christ, the members of which are those who have been initiated into it by baptism. They may be pious or impious, educated or uneducated, but if they have been once initiated (baptized) they are members of it. It matters not whether they have been baptized as Romanists, Methodists, Baptists, Unitarians, or what not; if baptized they are members of the Church. As far as membership goes, it does not matter what their views are—Trinitarian, Unitarian, orthodox, unorthodox, vegetarian, socialist, anarchist, or aught else. Church *membership* is not a question of character or belief, but of whether one has or has not been initiated into the society, and to this initiation, Anglicans hold that every child is entitled in virtue of his humanity. Once within the Church, it is indeed the duty of the

individual and the duty of the Church to aid the individual to grow up in the right way; but his *membership* depends not on how he grows up, but on the fact of initiation. This being so, the only difference, *as far as organization* goes between Christians, is one of geography. In one place there can only be one Church. Anglicans recognize only parish, diocesan, and national divisions. It is here that they differ from Romanists. Anglicans hold that parishes are associated in dioceses, and dioceses in national churches, and national churches in one oecumenical Church, but

The Church. with no parish, diocese, or national church having supremacy over any other. Under the One Head of the

Church, Christ, they hold the Church to be democratic, with no human superior or head. So conceiving the Church, they hold that in each parish the Church of that parish is responsible for all the life in that parish, be it political, social, industrial, or aught else. They believe that the Church is a secular institution as truly as a spiritual one, because they recognize no divorce between the secular and the spiritual. Hence work is one form of worship, and worship is one form of work. This position by no means necessitates the union of Church and State. It is not necessary that the Church have temporal power to influence a community. Let the State legislate, but let the Church be the inner controlling and animating power. Such is the position.

That it is different from Rome in being essentially democratic and catholic, as it believes the Roman position to be imperial and sectarian, we have seen. That it differs essentially from the usual Protestant position, which forms the Church upon some especial creed, and groups around that all who hold its creed, is equally apparent. The Anglican position would recognize no opinionative differences and organize no opinionative churches. In the labor movement it would not organize a labor church nor a working man's church any more than a rich man's church, but would recognize all the baptized as belonging to one Church, whose creed, laws, and forms of worship are to be neither fixed nor changed by individuals, but to be voted on democratically by all the initiated and by none else. This united power it would set to work, in dependence upon Divine life, to influence all life. Such is the position.

As we have said, it is by no means wholly realized in the Church of England or in any country. The Church of England often acts like the narrowest sect. But the holders of this view contend that it was originally the catholic or universal conception of the Church, and that it has been, tho' abused and confused, best preserved in England. Says Professor E. A. Freeman (*Growth of the English Constitution*, p. 10), speaking of the English social unit: "That unit, that atom, the true kernel of all our political life, must be looked for in Switzerland, in the *Gemeinde*, or commune; in England—smile not while I say it—in the parish vestry." The holders of this Anglican view would have the parish vestry, or, rather, the whole parish perhaps, purged of entangling alliance with the State, freed from dependence upon wealthy patrons, delivered

from the narrowness which to-day makes the system often a scandal and a derision, reassert its true function of influencing the whole broad life of the community.

Holland, and *The Social Faith of the Catholic Church*, by W. D. P. Bliss. See also *The Church Reformer*, 8 Duke St., Adelphi, London, W. C., England, and *The Dawn*, Boston, Mass.

ANSEELE, EDWARD, born 1856; son of a shoemaker in Ghent; became a clerk in a notary's office, and then a painter, in order to work for socialism. He founded the papers *Volkswel* and *Vooruit*. His great work, however, was the foundation of the *Vooruit*, the Socialist Co-operative Bakery, and Socialist Club of Ghent, and precursor of the important socialist cooperative movement in Belgium (*q.v.*). He is author of a Flemish socialistic novel, for the writing of which he suffered six months' imprisonment.

ANTHONY, SUSAN BROWNELL, was born at South Adams, Mass., February 15, 1820. Daniel Anthony, her father, a cotton manufacturer, was a liberal Quaker. After completing her education, Miss Anthony taught in New York State from 1835-50. She first spoke in public in 1847, and from that time took part in the temperance movement, organizing societies and lecturing. Through her exertions and those of Mrs. E. C. Stanton women came to be admitted to educational and other conventions, with the right to speak, vote, and serve on committees. About 1857 she became prominent among the agitators for the abolition of slavery. In 1858 she advocated the co-education of the sexes. Her energies have been chiefly directed to securing equal civil rights for women. In 1854-55 she held conferences in each county of New York in the cause of female suffrage, and since then she has addressed annual appeals and petitions to the Legislature. She was active in securing the passage of the act of the New York Legislature of 1860, giving to married women the possession of their earnings, the guardianship of their children, etc. During the war she devoted herself to the Women's Loyal League, which petitioned Congress in favor of the Thirteenth Amendment. In 1860 she started a petition in favor of leaving out the word "male" in the Fourteenth Amendment, and worked with the National Woman Suffrage Association to induce Congress to secure to her sex the right of voting. In 1867 she went to Kansas, with Elizabeth Cady Stanton and Lucy Stone, and there obtained 9000 votes in favor of woman suffrage. In 1868, with the cooperation of Mrs. Stanton and Parker Pillsbury, and with the assistance of George F. Train, she began in New York City the publication of a weekly paper called *The Revolutionist*, devoted to the emancipation of women. In 1872 she cast ballots at the State and Congressional election in Rochester, in order to test the application of the Fourteenth and Fifteenth Amendments of the United States Constitution. She was indicted for illegal voting, and was fined by Justice Hunt; but, in accordance with her defiant declaration, never paid the penalty. Between 1870 and 1880 she

lectured in all the Northern and several of the Southern States more than 100 times a year. In 1881 she wrote, with the assistance of her co-editors, Elizabeth Cady Stanton and Matilda Joslyn Gage, *The History of Woman Suffrage*, in two volumes.

ANTI-MASONS, a name given to a political party formed in New York and other States in 1827. William Morgan, a tailor of Batavia, N.Y., it was said, intended to betray the secrets of the Masonic order. He disappeared suddenly, and his fate has never to this day been discovered. It was rumored that he had been murdered by the Masons, and in the excitement that followed the above-named party was formed. Legal investigation as to Morgan's whereabouts was made, but nothing proved. The Governor and most of the public officers of the State were Masons, and this fact heightened the excitement. In 1828 the Anti-Masons cast a vote of 33,000, 70,000 the year following, and 128,000 in 1830. In New York, William H. Seward, Thurlow Weed, and Millard Fillmore were Anti-Masonic leaders. The party nominated William Wirt for President in 1832, but carried only one State—Vermont. In 1835 they elected the Governor of Pennsylvania. After this date the party rapidly fell to pieces, most of its members joining the Whigs.

ANTI-MONOPOLY PARTY, a party organized at Chicago May 14, 1884. It nominated Benjamin F. Butler, of Massachusetts, for the Presidency. Its platform demanded economical government, the passage and enforcement of equitable laws, including an interstate commerce law (since passed), labor bureaus, industrial arbitration, a direct vote for Senators, a graduated income tax, payment of the national debt as it matures, and "fostering care" for agriculture. It denounced the tariff and the grant of land to corporations. Its nominee was also indorsed by the Greenback Party (*q.v.*), and polled 130,000 votes.

ANTI-POVERTY SOCIETY, THE, was founded in New York City in connection with the Henry George movement of 1885-87. On March 26, 1887, a few men met in the office of *The Standard*, Mr. George's paper, to form a society, under the auspices of which "Father McGlynn" could conduct his work for land reform, which was then assuming large proportions. According to the account published in *The Standard*:

"They were of various creeds and shades of belief. One was a Catholic priest, another a Congregationalist clergyman, another a Presbyterian minister; some were Catholics, some Protestants, some agnostics, the strong band of union between them all being a deep religious conviction that poverty, with its attendant evils of vice and criminality and greed, is not an unavoidable curse inflicted on humanity by a cruel and offended deity, but altogether the result of a neglect by man of the beneficent laws of God. At this meeting and by these gentlemen the Anti-Poverty Society was organized, its principles and purposes being embodied in the following brief declaration:

"Believing that the time has come for an active warfare against the conditions that, in spite of the advance in the powers of production, condemn so many to degrading poverty, and foster vice, crime, and greed, the undersigned associate themselves together in an or-

ganization to be known as the Anti-Poverty Society. The object of the society is to spread, by such peaceable and lawful means as may be found most desirable and efficient, a knowledge of the truth that God has made ample provision for the needs of all men during their residence upon earth, and that poverty is the result of the human laws that allow individuals to claim as private property that which the Creator has provided for the use of all."

The President was Dr. McGlynn; the Secretary, Michael Clarke. Weekly meetings were held. The first public meeting was held May 1, 1887, in Chickering Hall, and public meetings were continued for many months amid intense excitement. This was largely due to the personal interest taken in Dr. McGlynn (*q.v.*) and in his contest with his archbishop and the papal authorities. As that passed away the excitement of the movement gradually dwindled, but the principles voiced in the movement were scattered and are still being scattered far and wide by the lectures of Dr. McGlynn and in other ways. (See SINGLE TAX; GEORGE; MCGLYNN; LAND, etc.)

ANTI-RENTERS (IN UNITED STATES HISTORY).—An organization which from 1839 to 1849 resisted the collection of rent on certain manorial estates in New York State. Mr. Alexander Johnston writes of them in *Lalor's Cyclopaedia*: "Large portions of Columbia, Rensselaer, Greene, Delaware, and Albany counties, in the State of New York, belonged to manors, the original grants of which were made to "patroons" by the Dutch Company, and renewed by James II., the principal being Rensselaerswyck and Livingston Manor. The tenants had deeds for their farms, but paid annual rental in kind, instead of a principal sum. This arrangement caused growing dissatisfaction among the tenants after 1790. When Stephen Van Rensselaer, who had allowed much of the rent to remain in arrears, died in 1839, the tenants, who longed to become real land-owners, made common cause against his successor, refused to pay rent, disguised themselves as "Injuns," and began a reign of terror, which for 10 years practically suspended the operations of law and the payment of rent throughout the district. An attempt to serve process by militia aid, known as the Helderberg War, was unsuccessful. In 1847 and 1849 the Anti-Renters "adopted" a part of each State ticket, and thus showed a voting strength of about 5000. In 1850 the Legislature directed the Attorney-General to bring suit against Harmon Livingston, to try title. The suit was decided in Livingston's favor in November, 1850, but both parties were then ready to compromise—the owners by selling the farms at fair rates and the tenants by paying for them."

ANTI-TENEMENT-HOUSE LEAGUE.

—This is a league formed in Boston March 6, 1891, to preserve and protect the home, to abolish the tenement; and since it believes the making of clothing under the contract or sweating system in tenements (see SWEATING SYSTEM)

to be the worst industrial evil in tenement life, the League has given its first and main efforts to fighting this sweating system.

By the by-laws adopted the objects of the League were said to be :

To encourage the manufacture and sale of goods made under healthful conditions, and to secure the final abolition of the tenement-house and sweating system of manufacturing clothing.

Its methods were said to be :

To call attention, by means of lectures and the distribution of literature, to the danger to public health and morals consequent upon the herding of people together, and the turning of the family into a factory, and to take such other steps as may be deemed necessary to secure the objects of the League.

On June 8, 1891, Mr. Crowley, the secretary, who for several years had been carrying on a crusade against the sweating evil, both in Boston and New York, arousing much interest by his revelations, addressed a letter to the clergy of Boston, urging them to take up the theme. In response many sermons were preached, among them those by Mr. Banks, since published under the title *White Slaves*. Another phase of the agitation was the addressing of a letter to Postmaster Hart, of Boston, advising him that the letter-carriers' uniforms were being made in tenement-houses by sweaters. This was denied ; but it was found that Mr. Crowley was right, and the contract was taken away and awarded to a clean firm, who were underbid the next year by a firm prominent in the sweating system. The result of this agitation was the present law in Massachusetts requiring all clothing-makers in tenements to have a license, creating two commissioners to see that the law is not violated, and making other provisions.

In December, 1891, the League invited the clothing dealers of Boston to cooperate with it in suppressing the sweating system ; but only a few firms responded, and these in a lukewarm way, it being only too evident that the average clothing dealer was more interested in maintaining than in suppressing the sweating system.

The League then proceeded, at the suggestion of the secretary, to memorialize Congress upon the sweating system, and as a result Senator Hoar presented a bill suggested by Secretary Crowley, and Congress appointed a committee of investigation, whose report has since been published.

On June 7, 1892, the League held a joint meeting with the Industrial Aid Society of Boston and the stockholders of the Working Men's Building Association, to consider a plan presented by Mr. H. K. Hannah for building cheap suburban residences, to be sold on instalments to working men. As the result, a society has now been incorporated to build such homes. Other work of the League has been to give lectures and hold mass-meetings over the country, to spread literature and create public sentiment against the evil.

A. P. A. See AMERICAN PROTECTIVE ASSOCIATION.

APPLEGARTH, ROBERT, born at Hull,

England, in 1833. Tho unapprenticed, he picked up the trade of a joiner and cabinet-maker. He moved to Sheffield in 1852, and soon became the most prominent member of the local Carpenters' Union, inducing it to unite with the Amalgamated Society of Carpenters and Joiners in 1861. From 1862-71 he held the office of general secretary of this organization, voluntarily resigning at last. He was an unsuccessful candidate for the London School Board from Lambeth in 1870, polling a large vote ; and was invited to be a candidate for Parliament at Maidstone, but retired in favor of Sir John Lubbock. In 1871 he was appointed a member of the Royal Commission on the Contagious Diseases Act. Upon resigning his secretaryship he entered journalism for a time, but before long became foreman to a firm manufacturing engineering and diving apparatus. Eventually he became the proprietor of the business. He still retains (1895) his interest in trade-unionism. Mr. Applegarth sought to win for the trade-union organization a social and political status, and was, in his day, an ideal representative of the labor movement in the political world.

APPRENTICESHIP, a contract whereby one person, called the master, binds himself to teach some trade or profession to another person, called the apprentice, the latter being bound to serve the master for a specified period of time at low wages, and often for a season at no wages. This custom arose in the middle ages, and played an important part especially in the ancient guilds (*q. v.*). It did not merely apply to such occupations as are now followed by artisans. It was common and correct in the middle ages to speak of the university of smiths, or tailors. Toward the end of the medieval period and the beginning of industrialism, as the arts and trades became gradually established, each assumed the form of a college or corporation of masters and scholars. The term *apprentice* was then applied not only to mechanics, but to art students as well. The length of apprenticeship during the middle ages was seven years, the same length of time taken by undergraduates in the liberal arts. After this time the apprentice became a full member of the corporation, and was qualified to practise the business for himself and to teach others.

The rules of apprenticeship were much more strictly observed on the Continent than in England ; nevertheless, guilds were formed in England as early as the twelfth century. In the reign of Elizabeth it was enacted that no person should carry on any trade without having first served a seven years' apprenticeship. London became the stronghold of the guilds, which were frequently involved in political struggles and local tumults. During the reign of Charles II. the apprentice laws were limited and subverted by the judges.

Adam Smith and most of his school disapproved of apprenticeship, believing it to restrict the rightful liberty of the workman and restrain the full freedom of competition. There is no doubt that at that time there were many unwise and troublesome customs regarding apprenticeship that merited this antagonism ; but it is also certain that many of the charges brought

against the institution were too sweeping. The old trade corporations, however, were obliged to make way for the new trade-unions.

In the United States the English precedent has generally been followed in regard to apprenticeship. The division of labor has tempt-

European Guilds.

ed many masters to keep their apprentices busy at some one branch of the trade, and thus to fail in their agreement to teach them the whole business. This neglect has brought on suits for damages by the apprentices; and the Pennsylvania courts have decided that the master is bound to teach the apprentice every necessary part of the trade.

There have been no corporations in this country exactly similar to the European guilds, the one nearest approaching them being, perhaps, the Carpenters' Company, of Philadelphia. In the earlier part of this century efforts were made to enforce the apprentice laws, and to capture and punish runaways; but the establishment of the factory system and development of machinery undermined effectually the whole institution of apprenticeship. The division of labor has so simplified the labor of each worker that after a few weeks or even days of apprenticeship a boy or girl can learn almost any separate part of the trade. There is still great demand for skilled mechanics, but more especially for those of an inventive turn. It is only in the smaller towns and villages that the custom of apprenticing at present prevails; and it is to be noticed that it is from these towns and villages that the skilled mechanics of the cities come. It has been estimated that out of 4,000,000 skilled manufacturers and mechanics there are 3,000,000 in small towns and villages or cities of less than 20,000 inhabitants. Some large manufacturing cities still retain in a greatly modified form a system of apprenticeship; but generally there is no written agreement between employer and employee, and boys are hired under a verbal agreement, which permits them to leave or be discharged at any time. This plan results in creating large numbers of half-skilled workmen.

In the biography of James Nasmyth, of Manchester, England, the inventor of the steamhammer, the author says:

"But the arrangement which we greatly preferred was to employ intelligent, well-conducted young lads, the sons of laborers or mechanics, and advance them by degrees according to their merits. They took charge of the smaller machine tools, by which the minor details of the machines in progress were brought into exact form without having recourse to the intricate and costly process of chipping and filing. A spirit of emulation was excited among them. They vied with each other in executing their work with precision. Those who excelled were paid an extra weekly wage. In course of time they took pride not only in the quantity, but in the *quality* of their work, and in the long run they became skilful mechanics. . . . Every one of these lads was at liberty to leave at the end of each day's work. This arrangement acted as an ever-present check upon master as well as apprentice. The only bond of union between us was mutual interest. The best of them remained in our service, because they knew our work and were pleased with the surroundings; while we, on our part, were always desirous of retaining men we had trained, because we knew we could depend upon them. Nothing could have been more satisfactory than the manner in which this system worked."

Mr. Nasmyth found much carelessness in the

work of those employees who could not be discharged, and endeavored to prevent it by dividing the period of apprenticeship into half-yearly lengths. Other manufacturers have sought to retain apprentices by bonuses, or by establishing a rising scale of wages according to time served; but most success in fully training mechanics is expected from better general education. (See INDUSTRIAL EDUCATION.)

The American trade-unions, striving to raise wages, and therefore to limit the number of competitors for work, have often attempted to limit the number of apprentices which can be allowed to learn any trade; and this not unnatural step has tended to diminish the number of American skilled workmen, mechanics from Europe being allowed to enter this country with scarcely any limitation on immigration, and the trade-unions have been powerless to prevent their introduction. The only thing they could do was to take these men into their unions as rapidly as possible. Hence, without any ill will of unions against native-born workmen, but merely from their desire to raise their wages, has risen a state of things which some writers, not understanding the cause, have utterly misunderstood; as, for example, the conductors of the recent agitation on the subject in the *Century Magazine*, where (May, 1893) one finds such statements as these:

"Shall American boys be permitted to learn trades, and, having learned them, shall they be permitted to work at them? . . . Most persons thus interrogated would reply at once: 'Why do you ask such unnecessary questions?' We ask them because under the present conditions of trade instruction and employment in this country the American boy has no rights which organized labor is bound to respect. He is denied instruction as an apprentice, and if he be taught his trade in a trade school, he is refused admission to nearly all the trade-unions, and is boycotted if he attempts to work as a non-union man. The questions of his character and skill enter into the matter only to discriminate against him. All the trade-unions of the country are controlled by foreigners, who comprise the great majority of their members. While they refuse admission to the trained American boy, they admit all foreign applicants, with little or no regard to their training or skill. In fact, the doors of organized labor in America, which are closed and barred against American boys, swing open, wide and free, to all foreign comers. Labor in free America is free to all save the sons of Americans.

Apprenticeship and American Trade-unions.

Shall American Boys Learn Trades?

"These are neither idle nor exaggerated statements. They are sober, solemn truths, expressed with studied moderation. So-called American labor to-day is a complete misnomer, as far as the trades are concerned. How has it come about that the United States alone among the nations of the earth has not merely surrendered possession of her field of mechanical labor to foreigners, but acquiesces when the foreign possessors exclude from that field her own sons?"

Professor E. W. Bemis, at the time of Chicago University, in an article first appearing in the *Annals of the American Academy of Political and Social Science*, contends that these statements cannot be substantiated. He says:

"Most of our trade-unions have so little prejudice against any nationality, native or foreign, that they keep no records of the number of each in their membership. . . .

"While the foreign born are in the majority in many of the hard-handed industries, this is not because of our labor organizations, but often in spite of their efforts, of late increasing, to prevent by restricting immigra-

tion this form of competition of those with a lower standard of living. Where the American born are not in our unions, it is either because the American boy does not like manual labor, and so is not engaged in the trades in which there are unions, or else he refuses to join the union of his trade. Many unions write that the Germans take most readily to labor organization, while in Chicago the native farmers' boys from the Atlantic seaboard States are least responsive. An intense, self-sufficient individualism, which was more fitted to our earlier history, where organization of capital was also little developed, than to the present era of the corporation and the trust, keeps a large, but of late, decreasing percentage of the American boys actually in our trades from joining the unions of those trades."

Nor can it be even shown that the majority of trade-unions seek to unduly limit apprenticeship. In 1891 Professor Bemis investigated this question, embodying the results in a paper which appeared in the proceedings of the American Social Science Association for that year. Mr. Bemis says :

"Of the 60 to 70 trade-unions in the United States then having a national or international organization, 48, with a membership of over 500,000, made returns to the writer. Most of the other unions are small and known to place no restrictions on apprentices. Now of these 48 unions, 28, embracing 222,000 members, or 45 per cent. of the above 500,000, had no restrictions upon apprenticeship; in 10 unions, with 107,000 members, or 39 per cent. of all, restriction was left to the locals. Nearly all of these 107,000 were carpenters, printers, cigar-makers, painters, and decorators. No returns were received from most of the building trades aside from the carpenters, but it is known that where they have any restrictions upon apprenticeship, they are usually a matter of local regulation. Let us examine a little the restrictions in these unions. Only those branches of the cigar-makers' organization which make the better grade of cigars attempt any restriction at all of apprentices. Where restriction is attempted, it is usual to allow one apprentice to a shop and two apprentices

Statistics.

where from five to 10 journeymen are employed. The term of apprenticeship being three years, and the natural working life of cigar-makers over 15 years, there is, in the application of this rule, opportunity for a considerable yearly increase in the number of cigar-makers. It may be a sufficient evidence that the cigar-makers do not unduly restrict the number of apprentices if I state that the Chicago union, with a membership of 1900, has between 700 and 800 apprentices.

"Of the 11 local typographical unions in New York State investigated in 1886 by the New York Bureau of Labor Statistics, eight reported some restriction of apprentices. The very moderate rule common to most of these was one apprentice to four or five journeymen, the term of learning being four years. But such rules are of comparatively little avail in keeping down the number of apprentices because of the large number trained in the country newspaper offices, where, in the absence of unions, no rules are applied. All of the 11 unions, as stated in the report, admitted to their membership on equal terms with any others those boys who had learned their trades in non-union establishments. The Chicago Typographical Union allows one apprentice (in newspaper and two in job offices) to the first 10 journeymen and one apprentice to every five journeymen thereafter. A veteran printer of the union has found this rule would allow for the 1700 membership of one of the Chicago unions about 250 apprentices, but the number employed is only about 140, very clearly proving that not as many boys desire to be apprentices in the printing trade by nearly one half as the union rules would allow.

"In view of the common belief that the building trades are successful in limiting the number of apprentices, it is very significant to note the fact brought out in the Massachusetts census for 1885, that in none of the building trades was there one half, and in most cases not one fourth, as many apprentices as the union rules would allow. Among the blacksmiths there was one apprentice only to 23 journeymen; among the carpenters, 1 to 62; among the machinists, 1 to 20; among the masons, 1 to 105; among the painters, 1 to 89; among the plumbers, 1 to 44; among the printers, 1 to 10; among the tinsmiths, 1 to 16. In Wisconsin, in 1880, according to the fourth biennial report of the Commissioner of Labor and the industrial statistics of that State, there was only one apprentice to every 13 among the masons; one to every 12 among the carpenters; one to every 12½ among the painters, while there were three apprentices to every four journeymen among the plumbers.

"Two of the most exclusive unions in this country are the Tile-Layers and the Flint Glass-Workers. The former, with a small membership, requires a learner to serve two years as an apprentice, and then he must be able to secure a two years' contract as a laborer at \$3 a day for the first year and \$3.50 for the second. He must then be able to earn \$4 a day and pay an initiation fee of from \$25 to \$100, according to the locality.

"The Flint-Glass Workers allow only one apprentice to every 20 men, unless there are less in a shop, and he must serve four years. By adding an initiation fee of \$100 in case of emigrants, and having other stringent shop rules, they keep up wages to from \$6 to \$9 a day for their members in this skilled trade during the 10 months' work season. But these examples of a labor trust modeled after the increasing examples of the same among capitalists are the exception in the labor world.

"Only 17 of the 48 unions making returns as above stated had any national rules restricting apprentices, and only 14 of these unions, with 71,000 members, or 14 per cent. of the 500,000 in the 48 unions, reported any success in the enforcement of such rules. Of these 71,000, 9500 were glass-workers, 5417 were hat-makers, 20,000 were iron-moulders, and 20,000 were journeymen tailors."

Mr. Bemis continues in his article in the *Annals of the American Academy* :

"Altho the writer of the *Century* articles charges the trade-unions with the downfall of the apprenticeship system—the only system known until very recently for imparting trade instruction—he says in the June number, 1893: "At the sixth annual convention of the Pennsylvania Association of master house painters and decorators, held at Scranton in January last, one of the delegates read a paper on the apprenticeship system as observed in his trade. He said that after a personal investigation among at least 600 master painters and decorators of Philadelphia and vicinity, he had discovered that not an average of one in 15 had a single apprentice in his business, and that the larger the workshop or establishment, the greater seemed the abhorrence with reference to the employment of boys to learn the trade, many of the masters going so far as to say that in all their experience as masters, extending over 15 to 35 years, and employing from 15 to 50 and as high as 80 workmen, they had never bothered their brains teaching a boy the business."

"The downfall of the apprenticeship system is due largely to the introduction of machinery and the consequent subdivision of work in large shops. This renders it impracticable for the employer to take a personal interest in each of his men, or to give them an all-round training. It is more profitable to set the learner at work upon a single machine or branch of work, where he will soon acquire speed. The boy prefers this, because he is eager to begin earning as soon as possible. But the apprenticeship system as managed under modern conditions is at best a poor method of trade instruction. It is a picking-up process. Scores of wage-earners have assured me that very little actual teaching is done for the boy in the apprenticeship, but he must do a great deal of drudgery, run more or less danger of moral contamination, and can only learn what he may incidentally pick up by watching others. This is a great waste of time. There is no awakening of keen ambition and love of the work; no adequate training or imparting of dignity to the work. A journeyman is hardly ever paid, as he should be, when on piece-work for the time lost in teaching an apprentice. This alone accounts for much of whatever opposition there may be among journeymen to a large number of apprentices."

Such seem to be the facts as to the situation. For a discussion of the question of industrial education, see article under that name.

A suggestive treatment of the problem of apprentices is reported from Neuchâtel in Switzerland :

"A new law for the regulation of apprenticeship in Neuchâtel came into force in February, 1891, from which much good is expected. The aim of the law is to raise the status of apprentices and to develop industrial skill in the different trades practised in the canton, but especially in the watch-making industry. To this end all apprentices are placed under the supervision of the communal authority, which can delegate its powers to a select committee, composed of equal numbers of employers and employed. Where *Conseils de Prud'*

hommes or trade syndicates exist this supervision can be entrusted to them. The committee must from time to time visit the workshops where apprentices are employed and see that the latter are properly taught and treated. Masters are forbidden to take apprentices without a written contract, or to employ them in other than their proper occupation, and they are also required to allow them sufficient time for religious and secular instruction. The hours of labor are fixed at 10 per day for apprentices between the ages of 13 and 15, and at 11 hours a day for those over 15, the hours devoted to education being included in these limits. As a rule, no apprentice can be required to work at night or on Sundays or holidays. The Council of State of the canton appoints a commission in connection with the cantonal department of industry and agriculture, which must be as representative as possible of the trade-unions recognized by the State. The function of the commission is to consider all schemes which may result in the improvement of the position of apprentices, and to examine all apprentices on the expiration of their apprenticeship.

The persons admitted to these examinations must be apprentices of Neuchâtel or other Swiss cantons who have served at least half of their time with an employer resident in the canton. The examinations include theoretical knowledge, but lay greater stress upon the practical work turned out by the apprentice. Candidates who satisfy the examiners are provided with certificates from the Minister of Industry and Agriculture, stating the results of the examination. Prizes consisting of books, tools, or a savings-bank account are given to the best candidates, and exhibitions are provided for those who are desirous of further perfecting themselves in their trade. The sum of 3000 frs. is to be devoted annually to prizes from the cantonal budget, and the work executed by the candidates who pass their examination is to be publicly exhibited. All the provisions of this law are equally applicable to women."

AQUINAS, ST. THOMAS, the chief representative of the theology, philosophy, and economic teaching of the medieval Church. He was born in 1225 or 1227, at the castle of his father, the Count of Aquino, in the territories of Naples; and he received his education at Monte Cassino and the University of Naples. When but 17 years old, in spite of the opposition of his family, he took the habit of the Dominican order at Naples, and was afterward sent away to study theology and philosophy under the famous Albertus Magnus at Cologne and Paris. Aquinas early gained distinction as a student of theology, and began his lectures, which were given at Paris, Rome, Bologna, and other places. He was on familiar terms with many princes of his time, and especially honored by the kings of France and of Naples, who frequently sought advice from him. The Popes also were not slow to recognize the merit of Aquinas; and Clement IV. offered him the archbishopric of Naples and the abbacy of Monte Cassino, both of which were declined. It was on the route to the Council of Lyons, whither he had been specially summoned by Gregory X., that Aquinas died, March 7, 1274. He was canonized in 1323 by Pope John XXII. In his life there was a union of simple piety with the greatest philosophical power. He fulfilled the ecclesiastical ideal of a saint and a Father of the Church. As

a theologian his name stands with that of Augustine.

To us Aquinas represents scholasticism, the philosophy of the middle ages. From the beginning the Christian Fathers, like the later Alexandrians, had made philosophy the handmaid of religion; and we find in scholasticism the same exaltation of theology over all other knowledge. Scotus Erigena, the earliest schoolman, said: "There are not two studies, one of philosophy and one of religion; true philosophy is true religion, and true religion is true philosophy." Hence the greatest work of Aquinas, the *Summa Theologiæ*, aimed to give a summary of all the science of the time. Into the philosophical and theological part of the *Summa* it is not necessary to go at length in this article. It may be said that the whole philosophical effort of the middle ages was to reconcile the demands of reason with the dogmas of the Church. So in the *Summa* Aquinas asserts the existence of two sources of knowledge—revelation and reason. Revelation includes Scripture and Church tradition and teaching. Reason, in this sense, is natural truth, such as came to men through the philosophy of Aristotle and Plato. Natural truths are to be apprehended by the individual reason and the supernatural truths of revelation by faith. Yet these two kinds of truth are not at variance, since they rest on the Absolute One, who is God. Philosophy and theology are, therefore, harmonious. There are three principal divisions of the *Summa Theologiæ*, which may be said to treat respectively of God, man, and the God-Man. The latter part of the third division was added after the death of the author. Of the other works of Aquinas, his commentaries on Scripture and on Aristotle, and the *Adversus Gentiles*, dealing with Mohammedan science, it is not necessary to speak further. All his writings lead up to the *Summa*.

To Aquinas theology is the sum of all science, and hence he is little interested in economics. But since the scope of the *Summa* was so wide, he naturally was obliged to deal to a certain extent with both politics and economics. His statements have great value to students of social questions, because he so thoroughly represented medieval Church thought. Most of his teaching on these subjects may be found in various passages of the *Summa*.

In regard to private property, Aquinas justified individual ownership. He argued that the results of private ownership were beneficial, and he adopted from Aristotle the theory that property should be owned separately, but used for the common good. Aquinas, however, had to deal with the fact that the Christian Church at first seemed to condemn private property and to glorify communism. There was even in the canon law itself an apparent approval of common ownership, and in one place a declaration, quoted from Clement of Rome, that all men ought to have the use of the things of this world in common. Hence some explanations and qualifications were necessary, if he wished to harmonize his own position with that of the early Church. By natural law, in one sense,

there was no reason why a piece of land should belong to one person rather than to others. But in another sense, Aquinas says, since it was desirable that the land should be cultivated without interruption by violence, the private ownership might be called natural. It is natural by way of consequence, tho not natural absolutely. Private property was due to positive enactments of law; but the natural law did not introduce it, neither did it forbid it. Thus Aquinas justifies, tho with the qualifications mentioned, the principle of individual ownership. In dealing with the subject of property as it concerned the monastic orders, or as it affected the highest sort of Christian living, Aquinas takes the conservative view. He holds, in opposition to many in the monastic orders who wished for absolute poverty, not only individual, but corporate, that property is only injurious when it hinders the spiritual life. A moderate property, especially if possessed by a religious order, is not necessarily an evil.

Following naturally from his views as to poverty and private property comes the position of Aquinas in regard to the bestowal of charity. He does not unduly exalt almsgiving, as some Church writers had done. The practice is obligatory; but at the same time alms need only be given, as a general thing, after a man has provided for himself and his family in a proper way. The giving should usually be from the superfluity—what remained after legitimate expenses.

One example of Aquinas' teaching on politics may be referred to. On the question of the right of government to tax its subjects, he favors the subjects rather than the prince. He says

that rulers should seek the common good of the people in preference to their own advantage. Hence they

Right of Taxation.

should not take from their subjects by taxation save when some public need arises. Their revenues should

be derived from their own special possessions. But it is right that they should tax their subjects for such purposes as the common defense against an enemy, etc. This opinion was advanced in answer to an inquiry put to Aquinas by the Duchess of Brabant.

In treating of commercial ethics, Aquinas follows generally the teaching of the earlier Church Fathers, and stands firm for the application of Christian principles to trade. He agrees with the old views as to usury, and especially with those of his instructor, Albertus Magnus. Usury is wrong. Money is a *consumptible*; the borrower has a natural right to make use of it when loaned, and the lender should not ask a payment for its use in addition to the return of the original sum, as this would be a double charge. Aquinas, however, allows the right of the lender to make a charge for any loss that might occur from the payment of the money being deferred beyond the set time. Though usury is a sin, it is not wrong, he teaches, for a man to borrow from a usurer for some good purpose, or for one to lend money to a usurer for safe-keeping, having no desire of gain.

Trade was, in Aquinas' view, a base thing, and even sinful when carried on for the sake of gain. But it was not so when the trader pur-

sued it as a means of livelihood, and was content with a moderate profit, which he used for good purposes. Further, trade was also right when it served the public interest and provided a country with the necessities of life. The civil law was wholly imperfect, then as now, from a Christian standpoint, in its provisions regarding business. The Christian principle was, according to Aquinas, that no one should ever demand or pay more than a just price. He was conscious of the opposition between his teaching and the civil law, but he explains that human law has its necessary limitations, and does not prohibit everything that is wrong. Divine law is higher, and must forbid all things that are opposed to justice and virtue. It was necessary, therefore, for Aquinas to protest against applying the principles of the civil law only to business, and to assert the pre-eminence of the Christian and Divine law. He makes competition subsidiary to justice.

The scholastic philosophy reaches its culmination in Aquinas, and no medieval writer has had more influence than he. The *Summa Theologiæ* was meant to be exhaustive, to be a compendium of all knowledge, and it remains the most complete body of moral and theological science ever written. It is even now, to a great extent, a recognized manual of the theology of the Roman Catholic Church.

References: There is no adequate account of the economic teaching of Aquinas; which may be best collected from Aquinas himself. See the *Summa Theologiæ* as to private property, *Secunda Secundæ*, *Quæstio 77*, *Articulus 3*; *Q. 66*, *Art. 1, 2*; as to voluntary poverty, *Q. 188*, *Art. 7*; as to alms, *Q. 32*, *Art. 5, 6*; as to slavery, *Pars Prima*, *Q. 96*, *Art. 3*; *Prima Secundæ*, *Q. 94*, *Art. 5*; as to price, *Secunda Secundæ*, *Q. 77*; as to usury, *Q. 78*; as to taxation, *De Regimine Judæorum* among the *Opuscula*. The best brief account will be found in C. Jourdain, *La Philosophie de S. Thomas d'Aquin*, 1858. See also W. J. Ashley, *Economic History*, vol. 1., part 1, 1888, and his article on Aquinas in Palgrave's *Dictionary of Political Economy*, to which article we are in the main indebted for that portion of our article bearing on Aquinas' economic teaching.

ARBITRATION AND CONCILIATION (INDUSTRIAL).—(For courts of conciliation other than industrial, see **CONCILIATION, COURTS OF**. See also **STRIKES AND PULLMAN STRIKE**. For arbitration between nations, see **INTERNATIONAL ARBITRATION**.) We are concerned in this article with arbitration and conciliation as applied to the settlement of industrial disputes alone. We consider, first, *definitions*; secondly, *the history of the subject*; thirdly, *the difficulties, advantages and various views of the different kinds of arbitration and conciliation*.

I. DEFINITIONS.

Arbitration and conciliation are not identical. Says Mr. Henry Crompton in his *Industrial Conciliation*:

“Arbitration is not the same as conciliation, but may be used when conciliation has failed, or where there has been no attempt at conciliation. Arbitration is ‘after the fact,’ and implies that a cause of difference and a dispute have arisen. By arbitration this may be settled, a compromise effected, and war averted; and that whether the dispute relates to past arrangements, as to what are the terms of an existing contract, the just application of those terms to a new state of things, or whether the difficulty is to agree upon future prices or conditions of labor. Desirable as this obviously is, conciliation aims at something higher—at doing before the fact that which arbitration accomplishes after.

It seeks to prevent and remove the causes of dispute before they arise, to adjust differences and claims before they become disputes."

There are various kinds of both arbitration and conciliation. There is, in the first place, the general distinction between *voluntary* and *compulsory* arbitration and conciliation.

Voluntary arbitration takes place when the parties to the dispute, *of their own will*, refer the matter at issue to the decision of a board or body of arbitrators, or even to one arbitrator, as may be agreed upon

Voluntary Arbitration. may do this of their own desire, or be induced by the mediation of outside parties or by public sentiment.

It is, nevertheless, voluntary arbitration, unless they are compelled *by law* to have recourse to such arbitration. The appeal may be made to arbitrators or to an arbitrator chosen in a great variety of ways. The arbitrating body may be chosen for the occasion, or it may be a standing board chosen by one employer and his employees, or by the united employers and employees, either of one trade or of one city or geographical section, or, again, the appeal may be to a board of arbitration appointed by the State or by outside parties. In all these cases it is still *voluntary* arbitration, even though the appeal be to a board appointed by the State.

Compulsory arbitration arises only when the law *compels* any employer or employee to *submit the question at issue to arbitration, and to abide by the result*. Unless the law compel *both* the submission of the question and the abiding by the

Compulsory Arbitration. judgment it cannot be called actually compulsory arbitration. An intermediate form of arbitration

may, however, be conceived of, and in a sense actually has been developed, where the law compels parties at strife to appear before a board of arbitration upon summons and to state their case and submit to examination, with or without evidence, yet where the law does not compel the parties to accept the decision. In such a case the hope is that by compelling the parties at strife to state and argue the case before responsible men, the judgment arrived at by such men and the publication of their decision will induce, or, perhaps, by the power of public sentiment even compel, the acceptance of the decision without compulsion by law. Again, the case may be conceived of, though we believe it has not been developed, where the law compels parties who have voluntarily resorted to arbitration to abide by the result. In full compulsory arbitration, however, both the resort to and the abiding by the decision of arbitrators must be required under the penalty of the law.

Such are some of the forms that *arbitration* may assume. *Conciliation* has, or may have, a similar variety of forms. Compulsory conciliation in its full sense may seem a contradiction of terms; nevertheless, the law may require, and often has required, as in France particularly, the maintenance of boards of conciliation, by which all questions liable to create strife must be decided, subject to appeal to various higher courts of law or of arbitration. Conciliation, too, when voluntary, may be of many kinds. A particular employer or firm may agree with his

or its employees on a board of conciliation to determine all matters on which differences are likely to arise, or a board of conciliation may be chosen by the united employers and employees either of a particular trade or of a particular town or geographical section; or government (national, municipal, or State) may appoint boards of conciliation; or, finally, private parties—a church (as in New York City) or any body of men—may appoint a board or committee of conciliation.

Once more, in *combinations* of both arbitration and conciliation there is chance for still more variety, while finally, as to the methods of choosing, constituting, and conducting boards, the differences are beyond computation, and cannot at length be noticed here. The main differences, however, *must be kept in mind*. There are often extreme objections raised against and difficulties encountered in the way of one form of arbitration and conciliation which do not apply to another. Of scarcely any industrial problem is it more difficult or more dangerous to make general statements. Before attempting any general consideration, therefore, the history should be carefully studied in considerable detail.

II. HISTORY.

The history of modern industrial arbitration and conciliation belongs almost wholly to the last quarter of a century, yet finds its origin in France early in the century, and there connects itself in an interesting way with the medieval methods of settling industrial disputes. (See GUILDS.) We shall study the history by countries, commencing with France.

In the silk trade of Lyons there existed, in the last century, created by the trade guild or corporation, a *Tribunal Commun*, for the settlement of industrial disputes, which was a part of the recognized guild system of the medieval period. It was broken up by the law of March, 1791, abolishing all the French guilds.

The silk manufacturers, however, felt its loss, and taking advantage of a visit of Napoleon to their city, they petitioned for an institution similar to their old court. This was granted by the law of March 18, 1806, and Lyons thus saw the first of what became the famous French *Conseils des Prud'hommes* (boards of conciliation, composed of skilled men of a trade). This first *conseil* and its immediate successors were not composed, as the *conseils* are now, equally of employers and employees. The employers were in the majority, and in a sense the working men were not really represented at all, for this first *conseil* consisted of five merchants and four *chefs d'ateliers* or overseers, and thus was representative of all the early *conseils*. They were what their name implied, councils of the heads, or skilled men of the trade. Nevertheless, they attempted the work of modern boards of conciliation, and with considerable success. Similar *conseils* were started at Rouen in 1807; Nîmes, 1807; Avignon and other places, 1808. By the law of 1809 workmen themselves were admitted to the *conseils*, tho' not in equal number with the manufacturers, this not being granted till 1848, and then being soon withdrawn. In 1810 a *conseil* was formed in the soap manufacturing trade in Marseilles, and from this time entered other trades. After 1810 the system spread through all France and into the adjacent countries. There are at present 117 *conseils* in France, four in Paris alone handling some 24,000 cases annually.

The *conseils* at present in France consist of two committees, or bureaux: a bureau of conciliation, called a *bureau particulier*, and a bureau of arbitration, called a *bureau général*. The bureau of conciliation is composed of one employer and one workman, whose office is to form a tribunal to which, without the cost, delay, or vexation of legal process, can be referred disputes

French
Conseils des
Prud'hommes.

between working men themselves or between working men and their employers. The jurisdiction of this bureau, however, is limited at present to the interpretation of contracts and disputes involving amounts not over \$40, though a bill has already passed the Chamber of Deputies to raise the limit to \$100. Two thirds of the cases that come before them are stated by the Report on France of the (English) Royal Commission on Labour, to be settled at a cost not exceeding 30 centimes (6 cents), the cost of issuing a citation notice; 75 per cent. of the cases refer to wages. The bureau is compelled to sit at least three times a week.

The bureau of arbitration (*bureau général*) is composed of three employers and three workmen, and considers cases that cannot be settled by the bureaus of arbitration. Witnesses may be called, and are compelled to appear. Counsel may not appear. Appeal can be taken to the Tribunal of Commerce if the sum involved is over \$40. Workmen and employees alternately preside. In each commune (township) or *circonscription*, the employers elect their representatives and the working men theirs. Details vary, but usually any working man of 25 years, who has worked three years in the place, has a right to vote for the workmen's representatives. The *conseils* have jurisdiction alone in the trades for which they are appointed. From 1879 to 1888 the bureaus of conciliation tried 470,280 cases, of which 66 per cent. resulted in conciliation, or were withdrawn before judgment, and 33 per cent. proved irreconcilable. The bureaus of arbitration heard 119,487 cases, of which 67,222 were withdrawn before judgment, 40,659 were finally decided, and 9886 were admitted to appeal. Less than one fifth of these ever came up for appeal, and of these only 32 per cent. were reversed. The difficulty of settlement, however, appears to be on the increase. In 1887, of 41,017 cases before bureaus of conciliation, 15,656 were not conciliated. In 1888, out of 41,117 cases, 16,319 were not conciliated. In 1889, out of 43,141, 16,178 were not. In 1890, in the *conseil* for the textile trade in Paris, 312 cases came up and 1124 could not be conciliated, and in 1891, 281 cases came up and 949 could not be conciliated. According to Maurice Bloch's *Annuaire de l'Economie Politique*, of the cases appearing before the bureaus of conciliation from 1876-89, 71 per cent. of the cases were conciliated; in 1881, 61 per cent.; in 1882, 64 per cent.; in 1883, 64 per cent.; since 1883, not over 53 per cent. This is perhaps due to the increasing size of industrial disputes. The *conseils*, it will be remembered, are limited to the comparatively minor matters of personal or implied contracts between employers and workmen, such as payment of wages, absence from work, poor workmanship, apprenticeship; but the increasing need has led to the question whether the *conseils* could not be made to settle more important matters, as in the cases of strikes, etc. It has been generally felt, however, in France, that their machinery was not adequate to such cases, and organizations of both employers and workmen have endeavored to construct machinery of their own to this end, while latterly the State has tried its hand. The most important of French strikes—that of the Carmaux miners in 1892—was settled by the intervention of M. Loubet, the prime-minister. According to the English Report on France (1894), out of 1212 employers' associations in France, 144 had provision for conciliation or arbitration, and out of 1588 working men's associations, 648 (in 1891).

French Conciliation.

On December 27, 1892, a law was promulgated in France providing for a new form of arbitration. In case of industrial disputes (strikes, etc.), it is the duty of the justice of the peace to urge (not require) having recourse to conciliation or arbitration, and he may organize a board of arbitration if he choose. Conciliation, however, must be voluntary and unanimous, not imposed by a majority vote. The law has scarcely had time to work, but in 1893 634 strikes are reported, and in 1903 conciliation or arbitration was tried. Of these attempts, 43 were initiated by the employees, 40 by justices of the peace, five by employers, and two by mutual agreement. Employers declined conciliation 33 times, employees five. In 54 cases, committees of conciliation were appointed; 33 led to conciliation, 21 being compromised. In 17 cases unconciliated disputes were referred to arbitration, but objections to the decision were raised six times by employers, three times by the employed, and twice by both. In 16 cases, strikes were continued after attempts at conciliation, but 10 were initially compromised.

Arbitration and conciliation in Belgium has little that is new. *Conseils des Prud'hommes* were established in Belgium, as in France, on the basis of the French law of 1806, but were so controlled by the employers and

by head workmen, whose interests lay more with the employers than with *bona fide* workmen, that they gave little satisfaction. The workmen's grievances were somewhat allayed by the law of 1859 and still more by the law of 1889. At present the Belgian *Conseils des Prud'hommes* resemble very closely the French. In Belgium, too, as in France, the difficulty of settlement seems to be rising, as appears in the following figures taken from the *Annuaire Statistique de la Belgique*, 1892, and quoted in the Report on Belgium of the English Royal Commission on Labour.

Belgium.

YEAR.	Cases.	Conciliated.	Arbitrated.	Not Settled.
1882.....	3,545	1,951	589	558
1883.....	3,314	2,183	275	560
1884.....	3,272	2,287	301	497
1885.....	3,336	2,305	322	488
1886.....	3,509	2,333	336	554
1887.....	4,171	3,079	425	650
1888.....	4,333	3,071	507	717
1889.....	4,578	3,391	477	695
1890.....	4,531	3,399	457	667
1891.....	5,078	3,250	838	967

As in France, again, there has been recent effort in Belgium to establish courts of arbitration and conciliation other than the *Conseils des Prud'hommes*. In 1876, after the strike at Marrinout, M. Weiler, mining engineer for the collieries, organized what were called chambers of explanations, which were practically boards of conciliation. They were somewhat successful, and in 1886, after the riots of that year, the Government passed a law establishing councils of industry and labor to act as boards of conciliation. Up to May 30, 1892, 50 councils had been established. But their success has not been great. The mining industry in Belgium is one where the miners work under very severe conditions, and strikes are constantly arising too bitter and too large for courts of conciliation to effect to any marked degree.

Passing from Belgium to other continental European countries our account is abridged from the very valuable and recent reports of the various countries made to the English Royal Commission on Labour.

Special courts for the settlement of industrial disputes have in some form or other been provided for by the German law since the beginning of the century. . . . **Germany.** incorporation into France of the left bank of the Rhine during the Napoleonic wars brought the Rhine provinces under the Napoleonic Code, which provided for the formation of *Conseils de Prud'hommes*. . . . Councils of this kind were instituted in 1808 for Aix-la-Chapelle and Burscheid, and in 1811 for Crefeld and Cologne; when the provinces reverted to Prussia the councils were left intact, and an effort was made to extend the system to other parts of the country. . . . By an Order in Council of August 7, 1846, they were called "Royal Councils," and empowered to deal with all disputes arising between manufacturers and their foremen, workmen, and apprentices; home workers were also included under their jurisdiction. . . .

The restriction of the power of the guilds effected by the Prussian Industrial Code of 1845 had led to dissatisfaction among artisans with the legal provisions for settling industrial disputes. The tendency of Prussian legislation appeared to be in the direction of relegating all disputes to the ordinary courts, while the artisans demanded special industrial courts on the model of those existing in the Rhine provinces. A committee of employers and employed, summoned by the Government to Berlin to consider the matter, drew up a bill for the establishment of industrial courts, which became law on February 2, 1849. Only 11 courts were established. . . . The procedure of these courts was not laid down with any exactness, and their constitution was not very clearly defined in the Act; these defects, combined with the delay attending their decisions, go far to account for their comparatively small success.

The Industrial Code of 1869, which regulated the industries of the empire, contained a section, since repealed by the Act of 1890.

In the amendment to the Industrial Code of 1881 concerning the guilds, provision was made for the establishment of courts of arbitration, for the settlement of

disputes between members of the guild and their journeymen or apprentices, and a further amendment of 1887 extended the jurisdiction of these courts in some cases to non-members. Further, the insurance laws of 1883 and 1884 provided for arbitration in disputes between employers and their work-people with regard to the amount which the employers should contribute to the sick funds, or the compensation due under the Accident Insurance Law. On the whole, however, the State provision for arbitration and conciliation in Germany has proved ineffective, and the advocates of this method of settling industrial disputes have, ever since 1873, made repeated efforts to secure additional powers. . . . In 1886 a resolution was passed "To request the Chancellor of the Empire to introduce a bill for the compulsory establishment of industrial courts, with the condition that the assessors in such courts shall be elected in equal numbers by employers and employed separately, and by ballot." The insertion of the word "compulsory" was due in a great measure to the influence of the socialist members, and it was omitted in the further resolution passed in 1889.

The law, finally passed on July 29, 1890, which came into effect on April 1, 1891, holds to the old principle of leaving the institution of industrial courts in the main to the communal authorities. It differs from the sections of the Industrial Code, which it supplants, by including a series of provisions for the formation, under certain circumstances, of a board of conciliation. The preamble states that "in many recent strikes it has been felt that, altho both sides were ready to treat, negotiations could not be initiated without long delay, because no regular and authoritative body existed which could undertake the conduct of such negotiations. The present law attempts to establish a body of this kind. . . ." The authorities of a commune, or of a number of communes combined, may establish such a court; should they prove remiss, the employers and workmen concerned may appeal to the central Government to order the establishment of a court. All expenses not covered by fees, costs, and fines must be met by the commune. The court consists of a president, nominated by the communal authorities and approved by the Government, and at least two assessors; but whatever be the number, half must represent the employers and half the employed. They are elected by ballot, and must be over 30 years of age; neither paupers nor persons under any legal disability are eligible, and all persons elected must have resided or been employed for two years in the district. Women may neither vote nor be elected. The electorate includes all persons over 25 years of age, who possess the qualifications required for assessors. The assessors, who cannot refuse election, except for special reasons, are compensated for traveling expenses and for loss of time. The contending parties may not be represented by lawyers or by persons who are professionally engaged in legal proceedings. The courts may take the evidence on oath both of the parties concerned and of witnesses or experts. If the matter in dispute exceeds the value of 100 marks (65), an appeal may be made against the decision of the court to the regular courts of the district. Any industrial court may convert itself into a board of conciliation when appealed to by both parties. . . . The decisions of the court, when acting as a board of conciliation, are not legally binding, and cannot be enforced; in other cases the court notifies its decision to the parties concerned, who must declare within a given time whether they accept it or not. . . . In any case, the result of the negotiations must be public. The court must give its opinion on industrial questions when required to do so by the Government or the communal authorities, and it is empowered to make suggestions to these authorities on matters relating to the persons or establishments under its jurisdiction. The law recognizes the existing rights of the guilds and their courts, but calls upon all other industrial courts to revise their constitution before April 1, 1892, and to remodel it in accordance with the existing law.

German Law. of age, who possess the qualifications required for assessors. The assessors, who cannot refuse election, except for special reasons, are compensated for traveling expenses and for loss of time. The contending parties may not be represented by lawyers or by persons who are professionally engaged in legal proceedings. The law recognizes the existing rights of the guilds and their courts, but calls upon all other industrial courts to revise their constitution before April 1, 1892, and to remodel it in accordance with the existing law.

So far 179 courts have been formed in the six largest German States, or 133 in Prussia, 13 in Bavaria, 13 in Saxony, nine in Württemberg, seven in Baden, and four in Hesse. Alsace and Lorraine, in spite of their great industrial development, have as yet taken no advantage of the Act, and the fact that Saxony has no more courts than Bavaria seems to show that there is no definite relation between the provision for arbitration and the probable need of it.

The *Sozialpolitisches Centralblatt* calls attention to the very few cases in which industrial courts have exercised the power given to them by the Act of resolving themselves into boards of conciliation. One

successful instance is, however, recorded in Kiel, in September, 1892, when a pending dispute between brewers and their work-people was averted. The Leipzig court has established an information office which furnishes advice gratis to workmen. The assessors attend in turns and give the workmen the benefit of their experience; and tho the office has lately been in difficulties, owing to the complaints of the unorganised workmen that its benefits were confined to those who were organised, it continues to exist and to do useful work. It was established in April, 1890, and in the first year of its activity gave advice to over 1000 workmen.

Efforts have been made from time to time in Germany to organise voluntary boards of arbitration and conciliation in the different industries, but except in the printing trade little has been achieved in this direction. In 1873 the Economic Club (*Verein für Sozialpolitik*) issued a report on the subject, and presented a petition to the Reichstag praying for the "speedy promulgation of a (normal) law authorising boards of conciliation." The trade-unions were in favour of establishing such boards, and, about 1870, boards seem to have been formed in Grünberg, Guben, Danzig, Berlin, Stralsund, Barth and Zingst, Rostock, Offenbach, and Biebrich. The details recorded of these boards are both meagre and contradictory; and their history does not appear to have contributed much to the records of successful arbitration.

In Switzerland, boards of conciliation and arbitration have already been instituted in connexion with 25 trade-unions, and in some cantons they have been established and supported by the cantonal governments.

The principal object of these boards is to draw up wages lists and workshop rules, which employers and employed both agree to observe. The unions in which they have been established have found them both active and efficient. The board of the Embroiderers' Federation **Switzerland.** considered 665 cases of disputes between October, 1885, and March, 1889, 554 of which it brought to a satisfactory conclusion. The cantons where they have been established are Geneva, Neuchâtel, Vaud, and Urban Bâle.

The *Tribunaux d'Arbitrage Industriel*, which were instituted at Geneva in 1874, consisted of a justice of the peace as president and two arbitrators, elected respectively by the employers and employed. These arbitrators acted from political motives, and hence the boards proved a failure. They were consequently abolished in 1885 to make room for *Conseils de Prud'hommes* on the French pattern. Disputes referred to these courts are first brought before the conciliation board, then before the board of arbitration, while a court of appeal gives the final decision as to all cases in which the damages are estimated at more than 500 frs. The judge and clerks are paid by the State, and the whole process is free both to employers and employed. Besides their judicial functions the *prud'hommes* are authorised to superintend the training of apprentices, the sanitary condition of workshops, and to make recommendations to the Government for the advancement of trade and industry in the canton. They thus form a kind of chamber of commerce.

A peculiar feature in the constitution of these boards is that counsel is not allowed to either side, but plaintiff and defendant are represented by members of the trade to which they belong. To facilitate this representation the *prud'hommes* are divided into 10 trade groups. . . .

In 1888, 753 cases were brought before the board of conciliation, 21 of which were withdrawn, and 522 were settled; the remaining 210 were passed on to the board of arbitration, 203 of which were settled by it and six by the court of appeal. The total number of cases for the first three years amounted to 2182, of which 1995 concerned questions of wages and compensation, 113 were cases of dismissal, 12 were connected with men who had left work without warning, 55 with breach of apprentice rules, five with certificates (*Förderung eines Zeugnisses*), and two with breach of contract. The disputes on wages questions thus form 01.3 per cent. of the total number, and the percentage of disputes settled by conciliation, which in 1885 amounted to 55.6, had risen in 1888 to 69.3. The beneficial results of the board meet with general recognition, and it is proposed to extend its competence to agriculture also.

An Act conferring similar powers was passed at Neuchâtel in 1885, with this difference, that whereas the Geneva boards are compulsory, in the canton of Neuchâtel they are optional, and are only formed in places which obtain the necessary powers from the cantonal Government. Each board consists of from 16 to 30 sworn members, and the president, who is elected for six months, is alternately an employer and

a workman. Each board has a court of conciliation and a court of arbitration. The officials of the board are elected and paid by the cantonal Government. These boards possess the same administrative powers as those of Geneva. Chaux-de-Fonds is the only place which has hitherto availed itself of the powers conferred under this Act, but the court established there has become a fixed institution, and is now regarded as indispensable.

In Italy institutions for the settlement of disputes between labour and capital hardly exist. In the event of strikes, the political authorities are called upon to restore order; after which, by common consent, the question is either referred

Italy.

to the president of the local chamber of commerce, or, as at Rovigo, to the heads of the working men's associations, or, as at Genoa, to some influential person. But the labour chambers are now beginning to assume the position of arbitrators in disputes arising between masters and operatives. The recently organised chamber of Venice proposes in addition, under Art. 31 of its regulations, the establishment of a mixed industrial court of arbitration.

This principle of arbitration has also been adopted by the Government. As the commissioners of 1878 pointed out, boards of conciliation ought to be peculiarly easy to establish in Italy, where traditions of the mediæval trading associations still linger. "From the time of the communes, and throughout the most splendid period of Italian industry, the colleges (*le Università*) of merchants and craftsmen had the right of electing special judicial bodies which exercised both the functions of the modern commercial tribunals and those which are generally relegated to the colleges of *Probi Viri*." The commissioners of 1878, after many inquiries, came to the conclusion that the institution of boards of arbitration (*Collegi di Probi Viri*) would be well received both by employers and employed. Sixteen chambers of commerce and 22 prefects pronounced decidedly in their favour; four prefects and 10 chambers of commerce hesitated; 10 chambers of commerce and eight prefects were hostile. Nevertheless, no bill was agreed upon till June, 1893, and as yet little has resulted.

Of other countries Dr. E. K. L. Gould writes in the *Yale Review* (February, 1895):

"Provisions in Austria for dealing with industrial difficulties are fairly similar to those made in Germany and need not be separately described.

"In the Scandinavian kingdom of Sweden and Denmark disputes have to be decided, in the former country before a police court, in the latter by a suit at law the same as any ordinary breach of contract. A project is now before the Danish Parliament looking to the creation of industrial tribunals, to consist of not less than

Scandinavia.

four members, with a president chosen by them. Representation of both orders is to be equal. The sanction of the communal authorities is requisite. Questions arising under existing contracts are to be tried in these courts. As boards of conciliation only will they deal with collective disputes. There are no voluntary boards of any prominence in either of these two countries."

We come now to the in many ways more important study of arbitration and conciliation in England, and notice

England.

the first, Professor Jevons' summary of the early English legislation on the subject. He says in his *The State in Relation to Labour*, p. 150:

"Under the Elizabethan statutes there was no place for arbitration, because the conditions of labour were placed entirely in the hands of magistrates. But the decadence of that legislation was marked by the statute of the 20 Geo. II., cap. 19, which introduced a new principle by giving summary jurisdiction to justices of the peace in disputes between masters and servants when the term of hiring is one year or longer. A justice of the peace may decide all such disputes, although no rate or assessment of wages has been made that year by the justices of the peace of the shire, etc. Extensive powers were given to the magistrates for coercing refractory servants and apprentices, although there was the alternative of discharging them from their engagements. By the 3 Geo. II., cap. 11, the powers of the act were extended to the case of agricultural servants hired for less than a year; but the magistrate's interference was clearly limited to disputes arising during the currency of a hiring, and no power was given to bind servants beyond that term.

"During the eighteenth century a series of acts was partly the same as those known as the Combination Acts, which provided means for the settlement of disputes in particular trades, especially those engaged with cotton. The act of the 43 Geo. III. (1803), cap. 131, was of a more elaborate character, and enabled disputes between masters and weavers, or such as arise with persons engaged in ornamenting cotton goods by the needle, to be settled by referees appointed by a justice of the peace. Such acts were, however, consolidated and replaced by that of the 5 Geo. IV., cap. 95, which established one general law relating to arbitration of disputes in every branch of trade and manufacture (1824)."

Besides these laws, attempts were early made in England at voluntary arbitration. It is said that disputes were invariably settled in the pottery trade as early as 1836. The carpet-weavers in 1839 adopted a system of voluntary conciliation, consisting of a yearly meeting with their employers to determine wages. The system was still in practice in 1856. A Macclesfield Silk Trade Board of Arbitration was established in 1849, in direct imitation of the French *Conseils des Prud'hommes*, but it lasted only four years. In 1853 and 1854 the National Association of United Trades for the Protection of Industry was successful in conciliating several disputes. But it was not until 1860 that any important and permanent board of conciliation was established, the first being modelled after the French *conseils*, and established through the efforts of Mr. A. J. Mundella in the hosiery and glove trade of Nottingham.

Boards of Conciliation.

The trade had long suffered from disastrous strikes, and in that year had had three strikes, one lasting 11 weeks and threatening a general lockout. Conciliation came as a needed relief. The Nottingham board was soon followed by a similar board in the building trades of Wolverhampton, created by the efforts of Sir Rupert Kettle. The boards were very successful, and were copied rapidly. The action of these boards is purely voluntary; the only power used is the appeal to honour. The boards are made up of an equal number of representatives of employers and employed, the officers usually being a president, vice-president, and two secretaries, one for each class. All have an equal vote. Meetings are held monthly, quarterly, or when needed. The boards have a sub-committee to settle minor difficulties. Expenses are met by both parties.

At first the working men were admitted to the room, only to sit on a rude bench before their employers, and only allowed to speak when spoken to. To-day they sit around one table, employer and employé alternating. Conclusion is not usually reached by show of hands. Mr. Crompton, writing of these boards, says:

"The proceedings of the board are very informal, not like a court, but the masters and men sit round a table, the men interspersed with the masters. Each side has its secretary. The proceedings are without ceremony, and the matter is settled by what the men call a 'long-jaw' discussion and explanation of views, in which the men convince the masters as often as the masters the men. Of course this does not mean that every member of the board is always convinced, though it seems that even this is very often the case; but when they are not they are content to compromise. . . . It is, in fact, conciliation, and is far better than the decision of a court or of an umpire. The 'long-jaw,' ending in agreement, may take a longer time, but is the true practical way out of the difficulty."

Mr. Mundella, in 1868, after eight years' experience on the board, thus speaks on this point:

"When we came to make our rules it was agreed that the chairman should be elected by the meeting, and should have a vote, and a casting vote when necessary. I was chosen the chairman in the first instance, and I have been the chairman ever since. I have a casting vote, and twice that casting vote has got us into trouble, and for the last four years it has been resolved that we would not vote at all. Even when a working man was convinced, or a master convinced, he did not like acting against his own order, and in some instances we had secessions in consequence of that; so we said, 'Do not let us vote again, let us try if we can agree,' and we did agree."

Palgrave's *Dictionary of Political Economy* gives the following detail of the board established in 1860 in the manufactured iron trade of the north of England: "The men belonging to the different works select in each case by ballot a delegate, and the employers belonging to a single firm are similarly represented by a single delegate. The members of the board thus constituted elect a president, together with one secretary,

from among the delegates of the masters, and a vice-president, together with a second secretary, from among the delegates of the men. They also elect a standing committee, as it is called, consisting of five representatives of the men and five representatives of the masters (five of whom alone are able to discuss or vote on any question); and of this committee the president and vice-president are *ex-officio* members, without enjoying any power of voting. The standing committee meets every month, or, if occasion demands, more frequently, and the board itself meets twice a year and at other times when summoned by the committee. In the first instance, all questions are laid before the committee. They are submitted in writing to the secretaries seven days before the meeting; the written reply of the other side is usually placed before the same meeting, and an agreement of submission signed by the parties concerned. If the standing committee cannot arrive at an agreement, the referee, who is a permanent official, is called in and can take evidence; and in this way all questions may be settled, except a general advance or reduction in wages, or the appointment of an arbitrator. These questions the board alone can decide, and it also determines matters referred to it from the standing committee, selecting an arbitrator if it cannot itself arrive at an agreement. The necessary expenses of the board are defrayed by the subtraction of a penny every fortnight from the wages of every workman earning upward of half-a-crown a day, and by requiring each firm to pay an amount equal to that thus subtracted from the wages of their employes. Up to September 1, 1889, the standing committee had held 313 meetings and adjusted 850 disputes, and the board itself had met 109 times."

This board has proved to be one of the most important and successful. In 1868 formal boards of arbitration and conciliation were established in the pottery trade in Staffordshire, in the Leicestershire hosiery trade, and the Nottingham lace trade. Legislation, too, was introduced

Boards of Arbitration and Conciliation.

to aid the movement, an act to establish equitable councils of conciliation (30 and 31 Victoria, cap. 105) being passed in 1867, and another in 1872 (35 and 36 Victoria, cap. 46). Neither, however, proved really operative, save as matters of education. In 1872 a joint committee to settle disputes was appointed in coal trade in Durham, and soon after in Northumberland. Of these joint committees, Schulze Gaevernitz, writing in 1890, says that "for 16 years these committees have been uninterruptedly active. Their decisions have scarcely ever been disputed, and neither party has ever raised any objection to the committee as an institution. The Northumberland Joint Committee has since its establishment discussed and decided a total of almost 4000 cases." Nevertheless, alongside of this favorable view must be put an unfavorable view, which we shall consider later. In 1873 a joint committee was established in the Cleveland ironstone mining industry, and has been successful. In 1875, three other boards were established, particularly the South Wales Miners' Sliding Scale and Joint Committee, and almost every year since this some new board, and often more than one, has been organized, the down to 1889 no distinctively new feature was developed. Since 1889, however, a new form of board of conciliation has appeared. Down to this date all boards had been connected with some particular industry, but in 1889 the London Chamber of Commerce took the lead, in connection with the trade-unions of London, in an effort to establish local district boards unconnected with any one trade. In 1890 a board was established, and the same year the chambers of commerce in Bristol, Hull, Leeds, Manchester, Walsall, and Wolverhampton followed the example. Since then the movement has been almost constant.

Yet while we trace this growth of boards of conciliation, we have now to chronicle that many of the older ones are failing. According to the Report of the Royal Commission on Labour (1892), the board of the Nottingham hosiery and glove trades has, after 20 years, now become "practically extinct, though a desire to revive it is expressed on the side of the operatives." The arbitration portion of the pottery trade board has been given up, tho the committee of conciliation still continues. The board in the wrought-nail trade lasted only one year. Dissatisfaction is reported with other boards, while the existence of some of the boards most successful has not prevented some of the greatest strikes in England has yet known. The Newcastle arbitration agreement, representing "the matured experience of the colliery proprietors and of a compact body of 5000 coal-miners" is often praised, yet the subsequent history of the coal-mining industry, with its gigantic strike, is hardly an advertisement of the suc-

cess of the agreement. Says Mr. W. P. Reeves, Minister of Labour in New Zealand, writing in the *Review of Reviews* (American edition) for August, 1894:

"Even in the case of England one has only to read the dry list of strikes published monthly and yearly by the Board of Trade to see to how great an extent voluntary arrangements and optional conciliation have failed. When one takes up a magazine article or pamphlet by some worthy and optimistic disciple of Sir Rupert Kettle or Mr. Mundella, and reads that in 17 years the board of arbitration for the manufactured iron trade has settled 800 disputes, that the London Chamber of Commerce has drawn up a series of admirable conciliation rules, or that the powerful trade-unions of the boiler-makers has in 13 years never spent more in a year on labor disputes than 9 per cent. of an annual income of \$650,000, one is almost stirred to hope that the industrial millennium is within our horizon. Yet we turn to hard matter-of-fact records, and note that in 1889 the strikes in the United Kingdom numbered 1145; that in 1890 their total was 1028; that in 1891 it was 875; that in 1892 it was 601; and that for 1893 the figures seem certain to be rather higher than for the preceding year. Surely these prove that private voluntary boards are at the best but an imperfect palliative. . . . Thus the attempt a year or two since to form a central board for the British tailoring trade broke down ignominiously at the first award. Equally unfruitful was a well-meant endeavor made in the manufactured steel trade in the west of Scotland. The Macclesfield Silk Trade Board lasted only four years. Such stumbles on the threshold might be looked for. But it is significant to recall the break up of Mr. Mundella's model board establishment for the Notts lace and hosiery trade, and dissolved after 20 years of service. Nor, I read, is Sir Rupert Kettle's elaborate scheme, now resorted to in the Wolverhampton building trade, popular as it was for many years. Seventeen years of usefulness did not save the South Wales Miners' Joint Committee. Nor did a 25 years' life prevent the Conciliation Board for the Staffordshire pottery trade coming to an end in 1892. Like it, the Leicestershire Hosiery Board met the same fate after a long career. I cannot find that more than five of these trade conciliation boards have been newly set up since 1889. Yet the British strikes during the last quinquennial period have averaged nearer 900 than 800 a year. The chambers of commerce in London, Bristol, and other cities have indeed established general conciliation boards. But, except in the metropolis, they would seem to have done little or nothing. A few similar efforts in the colonies have had the like result.

"I must not be understood as wishing to belittle the undoubted usefulness of boards of conciliation. I do but point out that their utility lies chiefly in arranging in a friendly way those minor points of difference which seldom lead to strikes. Nevertheless, he would not be a very acute observer who could not see that it is these same minor points which, left unsettled, occasionally lead step by step to the worst and most embittered conflicts. The causes of some of the most lamentable and heartfelt strikes and lock-outs have been curiously inadequate."

Mr. Reeves goes on to make a plea for compulsory arbitration which we shall consider later. We are now concerned simply with the history of the subject, and of compulsory arbitration there has been no history.

The last point that we must notice in the history of the subject in England, is the distinguished success that has been reached in some important cases, in the settlement of large strikes, by the voluntary interposition of men of unusual influence and unquestioned standing in the community. This was notably the case with the great dock strike of London in 1889. About 150,000 workmen were involved in the strike; it had paralyzed the commerce and affected the trade of all London. It naturally arrested universal attention.

Very great sympathy was felt for the dockers. Support came in from the wealthy and the poor. Australia sent funds. The clergy and members of the nobility contributed. About £40,000 passed through the hands of the strikers' committee. Their side was ably organized and led by John Burns, Tom Mann, Ben Tillett, and others. Nevertheless the dock companies were strong and determined. It was a desperate battle. Such were the conditions when Cardinal Manning, the Lord Mayor, the Bishop of London, and Sydney Buxton, M.P., undertook conciliation, and were finally successful, winning most of the points for the dockers. The dock companies yielded, they said, to an "external pressure" which "may have very far-reaching consequences in the future." Cardinal Manning undoubtedly exerted the greatest influence

Strikes.

in securing the result. It was very largely the personal weight of the committee that gave it its success, coupled with the fact that they acted at an opportune time. Similar was the influence of the Bishop of Durham and others in the great coal strike—these, together with other smaller ones, showing what public sentiment can do in settling even vast and heated controversies, when voiced by persons of commanding influence acting at opportune times.

Perhaps even more significant is the part that Government has commenced to play. We give from the *Weekly Times* of November 17, 1893, the text of the Government's invitation to the Coal-owners' and Miners' Federation to submit their differences to a conference, with a member of the Government, the Earl of Rosebery, as chairman. It is a document of historical importance, as the first step of this kind taken in any large way by Government, and because, as is well known, it led to the settlement of a most protracted and widely spread contest. The text is as follows:

"Sir: The attention of her Majesty's Government has been seriously called to the widespread and disastrous effects produced by the long continuance of the unfortunate dispute in the coal trade, which has now entered on its sixteenth week.

"It is clear from information which has reached the Board of Trade that much misery and suffering are caused not only to the families of the men directly involved, but also to many thousands of others not engaged in mining, whose employment has been adversely affected by the stoppage.

"The further prolongation of the dispute cannot fail to aggravate this suffering, especially in view of the approach of the winter, when the greatly increased price of fuel is likely to cause distress among the poorer classes throughout the country.

"Moreover, the Government have little doubt that the effect of the stoppage of industry is rapidly extending and increasing, and that unless an early settlement is effected, lasting if not permanent injury may be done to the trade of the country.

"The Government have not up to the present considered that they could advantageously intervene in a dispute the settlement of which would far more usefully be brought about by the action of those concerned in it than by the good offices of others. But, having regard to the serious state of affairs referred to above, to the national importance of a speedy termination of the dispute, and to the fact that the conference which took place on November 3 and 4 did not result in a settlement, her Majesty's Government have felt it their duty to make an effort to bring about a resumption of negotiations between the employers and employed, under conditions which they hope may lead to a satisfactory result.

"It appears to them that an advantage might accrue from a further discussion between the parties of the present position of matters under the chairmanship of a member of the Government, who it is hoped will not be unacceptable to either side.

"Lord Rosebery has consented, at the request of his colleagues, to undertake the important duty which such a position involves.

"I have, therefore, to invite the (Miners' or Coal-owners') Federation to send representatives to a conference to be held forthwith under his chairmanship. In discharging this duty, it is not proposed that Lord Rosebery should assume the position of an arbitrator or umpire, or himself vote in the proceedings, but that he should confine his action to offering his good offices in order to assist the parties in arriving between themselves at a friendly settlement of the questions in dispute,

"I am, etc.,

"W. E. GLADSTONE."

The latest significant step in the history of arbitration and conciliation in England took place in the settlement of the great boot trade dispute of this year (1895), and its significance consists in the deposit of money on both sides to assure their abiding by the agreement. Says the *Times* of April 26, 1895:

"There have been many boards of conciliation before to-day, but they have always lacked effective means of enforcing their decisions. It is a novel and important feature in this agreement that an attempt is made to provide a sanction for their decrees. . . . The agreement provides that immediate steps shall be taken to draw up piece-work statements for lasting and finishing piece-workers, and for welved work at Northampton; the employers to have the option of payment by time or piece. These statements are to be drawn up by a joint committee of employers and operatives, and any differences are to be determined by an umpire. Boards of arbitration and conciliation are immediately

to be reconstituted with revised rules, and empowered to settle all questions submitted to them concerning wages, hours of labour, and conditions of labour which cannot be settled mutually by employers and employed. No board is to require an employer to employ any particular workman, or a workman to work for any particular employer. No board is to claim jurisdiction outside its district, or to interfere with the rights of employers to make reasonable regulations for time-keeping or the preservation of order in their factories; or to put restrictions on the introduction of machinery or the output therefrom. Provision is made for financial guarantees for the carrying out of the agreement; and any question as to its interpretation is to be settled by Sir Courtenay Boyle, whose decision is to be final. It is understood that work will be generally resumed not later than the 29th inst.

"The two parties to the settlement have deposited sums of £1000 each with Sir Courtenay Boyle and Sir Henry James in accordance with the terms of the agreement. . . . Mr. Ward, President of the Federation, addressed a meeting of Leicester manufacturers on the terms of settlement, which he described as a charter of rights for the manufacturers, under which three fourths of the disputes which afflicted their industry would be rendered impossible."

Boards of conciliation in connection with trade-unions have existed in Australasia in several industries for many years. The Federated Seamen's Union drew up a scheme for such a board, which was accepted by the Australasian Steamship Owners' Association in 1884.

In case of failure to come to an agreement, the board was empowered to appoint two arbitrators. In 1886 the union refused to submit a case to the board, and the owners declared the agreement broken. The Boot Manufacturers' Association and the Operative Boot-Makers' Union of South Australia have established a board of conciliation consisting of five employers and five employés elected by their respective associations for 12 months at a time. . . . A board of conciliation also exists in connection with the Amalgamated Carpenters and Joiners. Five workmen members meet five employers and endeavour to arrange a settlement; the union's report for 1890 shows that some 30 disputes were settled in that year. In the building trades, if an isolated union fails to settle its difficulties by sending a deputation to the employer, the matter may be referred to arbitration, or to a board of conciliation; where this course is not adopted, or where it proves a failure, a ballot is taken to test the wishes of members in regard to a strike. The conciliation board connected with the Building Trades Council and the Contractors' Association put an end to a strike which arose during the building of the Hotel Australia, owing to an alteration in the hours of work without due notice. After hearing the representations of the board, the contractor agreed to defer the change for seven days; when the men returned to work, however, he reduced this period of notice to 48 hours.

Where no regular board of conciliation has been established, differences are sometimes adjusted by conferences between the two parties. In 1873 the master printers of Victoria entered into an agreement with their employés to hold a series of conferences at regular intervals with satisfactory results. The demands of the Seamen's Union in New South Wales were met by a conference in 1890, and a further conference was held in September of that year between the marine engineers and the shipowners, which for the time settled their differences.

The most frequent method, however, of settling disputes is by the intervention of bodies representing the federated unions in each colony. The majority of unions are now affiliated to some central body, and matters in dispute are accordingly referred to the central council when the lesser unions fail to effect a settlement. It then devolves on the officers of the council to intervene, and, either by sending a deputation to the employers, or by other forms of mediation, to put an end to the dispute. Should these efforts fail, the council again consults the individual unions as to the necessity of a strike. Thus the South Australian United Trades and Labour Council intervened in some 15 disputes of a more or less serious character, and in nearly every instance succeeded in improving the position of their members. In one instance they called a conference and obtained an agreement providing for the closing of butchers' shops at six on all week days except Saturday and abolishing Sunday work, except in the case of Government contracts. In two other instances they obtained reductions of working hours for carriers and for iron-workers.

Such conferences sometimes result in drawing up a

written agreement as to the future conditions of labour, and this method of promoting social peace is strongly recommended by the New South Wales Commission on Strikes. In most industries there have as yet been no such agreements, and in the few cases in which the custom has obtained, the agreement has only lasted a few years.

In New South Wales there have been two arbitration acts, the first passed in 1867, "to make arbitration more effectual," and the second in 1891, to establish councils of conciliation and arbitration in accordance with the recommendations of the Royal Commission on Strikes of 1890. No other colony has as yet (1893) passed any act on the subject, though a number of schemes have been prepared, and bills have been introduced into the various legislatures. . . . The act of 1891 divides New South Wales into five industrial districts; in each of these a council of conciliation is to be formed, two members of which are to be appointed on the recommendation of the organised employers and two on the recommendation of the organised employés. . . . The act is to continue in force for four years, *viz.*, till March, 1895. At a meeting of the Trade and Labour Council of Sydney, held after the passing of the act, to elect the nominees, a motion was brought forward to postpone such election until a compulsory clause was inserted in the act, on the ground that without such a clause employers would never agree to arbitration. The motion met with some approval, but was rejected on the ground that it was necessary to test the act before condemning it.

The history of arbitration and conciliation in the United States is more varied, but not so encouraging. The following sketch of the history is abridged from the Report on the United States of the English Royal Commission on Labour.

United States.

One very early instance of arbitration is recorded at the beginning of the eighteenth century, when a copper arbitration board was established in the mines of Simsbury, now called East Granby, in Connecticut. These mines, however, were soon exhausted, and for a time were converted into a State prison. The next recorded attempts at a peaceful settlement of industrial disputes is not until those of the Sons of Vulcan between 1865 and 1876.

On February 13, 1865, a Committee of Boilers met a Committee of Iron Manufacturers and agreed upon a sliding scale of wages, thus to this extent forming a board of conciliation.

It was agreed that the price for smelting iron was to be \$9 for every ton of 2240 lbs. when iron sold at 8½ cents a pound, and that the price for smelting was to be reduced 25 cents for every fall of a quarter of a cent in the selling price. Ninety days' notice was required to terminate the scale from either side, but it only lasted a few months. In 1867, after a strike in which the men had been successful, another scale was drawn up. By this the price for smelting was to be \$8 a ton when iron sold at five cents a pound, with a 25 cents' reduction for every fall of a quarter of a cent in the price of iron. The agreement could be terminated with 30 days' notice on either side. This scale remained in force for seven years, but was modified so as to allow of an advance in wages whenever the price of a pound of iron varied by a tenth of a cent. It did not provide for any fall in that price below three cents a pound, and when the price did fall below three cents the employers proposed a reduction of \$1 a ton, and the employés one of 50 cents. After a four months' strike the men were, as before, successful, and resumed work on the 50 cents' reduction. In 1876 the various classes of ironworkers united to form the Amalgamated Association of Iron, Steel, and Tin-workers of the United States, and several scales were drawn up for different branches, wages rising or falling in most cases with every fluctuation of a tenth of a cent in price. The method of fixing wages by sliding scale has continued among iron-workers up to the present time with more or less success.

In 1870 some of the shoe manufacturers of Massachusetts formed a committee of five to meet with the committee of the Knights of St. Crispin, and to draw up a scale of wages for the ensuing year. This was the first board of arbitration or conciliation in Massachusetts, and it was established in an industry which had been harassed more than any other by industrial conflicts. For a time the system worked well. In 1871 the committee met again to determine prices for the second year, but during the year difficulties arose between the employers and the Crispin organization, and at the beginning of 1872 the manufacturers returned no reply to the invitation of the Crispin committee. The collapse of the order, following upon a prolonged strike, led, in 1875, to the formation of the Shoemakers'

League, which again established a board of arbitration; but the league had so little influence, that at the end of the year it was dissolved by a unanimous vote. The next year witnessed a revival of the Knights of St. Crispin and of their board of arbitration, and to prevent a repetition of the previous troubles, it was determined that no strike should be declared except by the vote of the board and the unanimous consent of the employés in the establishment concerned. In 13 months the board settled over 100 difficulties, and its working was regarded with favour by the manufacturers, although they took no active part in its proceedings. It was composed of 11 members, each representing a different branch of labour. The members were elected for one year, and chosen, as Mr. Carroll D. Wright says, "Not alone for their integrity and general intelligence, but also because they were regarded as superior workmen, each being an expert in his branch of the business." In cases referred to them for arbitration, the decision of the board was final, in other cases an appeal might be made to the lodge, or local branch of the order. Meetings were held as often as required, generally twice a week. Members received no payment for evening attendance, but for time deducted from their working hours they were paid at the rate of 30 cents an hour. The order gradually gave way before the Boot and Shoe Workers' International Union, so that the attempt to substitute arbitration for strikes was not permanently successful. The work, however, accomplished by this board did much to show the value of the principle. We must notice also efforts of the Miners' National Organization to establish arbitration in the Tuscarawas Valley, Ohio. Their intention was defeated by the action of the Crawford Coal Company immediately after the award of 1874. In 1887 a second attempt was made, but it had little success. In 1870 the firm of Straiton & Storm, cigar manufacturers of New York, established a board of conciliation among their employés. The constitution of the board is in some respects peculiar. It consisted of two parts, a cigar-makers' board and a packers' board, and each body chose a delegate from the other body to sit with them, the firm being represented on both. The Cigar-Makers' Board of Arbitration, as finally constituted, consisted of four cigar-makers, chosen out of 15 delegates selected by the three departments, one packer, elected from the packers' board, three foremen appointed by the firm, and one member of the firm. The Packers' Board of Arbitration was composed of two packers, chosen out of seven selected by the packers as a whole, one cigar-maker elected from the cigar-makers' board, the packer foreman, and one member of the firm. On both boards, therefore, the employés were in a majority, and one of their number was in a position to give the casting vote in case of a division of interests. Wages were twice advanced by order of this board in 1870, and a further advance was made in 1880, though the board did not then grant the full amount demanded.

As the election of the workmen's representatives took place within the factory, there is some reason to suppose that it was not entirely free. When, after about eight years of existence, the workmen did exercise a free choice, the board was abolished by the firm. It had been combined with a benefit fund, to which all the employés were compelled to contribute a certain sum, but the benefits were only paid to workmen who met with an accident or fell ill while working for the firm. Any workman leaving forfeited all claim to any benefit, as well as to the sum which he had paid into the fund.

In 1878 Mr. Joseph D. Weekes was sent to inspect the English boards of conciliation, and on his return presented a report to the Governor of Pennsylvania. The result was the Wallace act of 1883, by which voluntary boards of arbitration might be established in Pennsylvania. Before the awards of these boards can become binding, they must be accepted by both parties to the arbitration. The Ohio arbitration act of 1886 provided for similar boards for Ohio, but in this case both parties must pledge themselves beforehand to accept the award.

Boards of this character have been established in Massachusetts, New York, and California. The Massachusetts act of 1886, as amended in 1887, provides for the appointment of a State board of arbitration composed of three persons, of whom one represents the employers, another the labour organisations, and the third is an impartial citizen recommended by the other two. The California State Board of Arbitration and Conciliation, appointed by an act of 1891, is similarly constituted. Of the three "competent persons" composing it, "one shall represent the employers of labour, one shall represent labour employés, and the third member shall represent

State Boards.

neither and shall be chairman of the board." The constitution of the New York Board of Mediation and Arbitration, established in 1887, is somewhat different; one of the three arbitrators is to be elected from the party "which at the last general election cast the greatest number of votes for governor of this State," another from the party casting the second greatest number, while a third is to be selected "from a *bona fide* labour organization of this State." In California the members are elected for one year only; in New York, for three, and in Massachusetts all the members serve three years, but only one retires every year, so that the persons composing the board are never all changed at once. By an amendment of 1890 to the act constituting the Massachusetts Board, in cases involving special technical difficulties, the two parties in dispute may each appoint an expert to serve on the board for the particular case. All three boards, though not nominally compulsory, possess very extensive powers. The Massachusetts Board may, upon the application of the employer, or of a majority of his employes, or of their duly authorized agent, open an inquiry, which it may make public or not at its own discretion and at any stage in the proceedings. Where both parties refuse arbitration the board may attempt to mediate between them, and, failing that, may, if it thinks fit, investigate the cause or causes of the controversy and publish a report, finding the causes and assigning the responsibility. When a decision is given, it is binding upon the parties for six months, or until the expiration of a 60 days' notice of an intention not to be bound by it given by one party to the other. Two instances are recorded in which such notice was given in the report of the Massachusetts Board for 1887; but in neither case was the award interfered with at the expiration of the period of notice. The New York Board has also a power of investigation which it may exercise when its services as an arbitrator are refused, and after arriving at the facts of a controversy, it may make them public and lay them before the Legislature. It is also empowered to suggest amendments to the existing laws touching labour questions. The California

State Boards. Board is similarly charged with the duty of investigating all disputes which threaten to end in a strike, and is empowered to publish the results of its investigation. In its report for 1889 the New York Board claims that the extensive powers granted to it by the act deter parties "from making undue exactions or unjust conditions," but neither here, nor in Massachusetts, nor in California, is any provision made in the act for compelling the observance of the award. The decision of the boards is only accepted where the parties are willing to accept it. The reports of the Massachusetts Board for 1888, 1891, and 1892 speak with satisfaction of the number of wage lists drawn up by the board, for which applications are often made afterward by other manufacturers, and which, therefore, serve as a standard of prices. Further, manufacturers often apply to the board for advice in fixing the rate of wages or the price for a new kind of work. The report for 1891 states that the yearly earnings of the employes affected by controversies, which were dealt with by the board in 1890, amounted to \$4,056,195, and that the total yearly earnings of the factories were \$12,044,525. The expense of maintaining the board was \$3,108.86, so that, if successful in preventing strikes, it implies a considerable saving to the community. The report for 1888 states that some firms enter into a written agreement with their employes to submit all differences which may arise to the arbitration of the board.

All the three boards have power in all cases to summon witnesses and to examine them under oath, as well as to require the production of books containing the record of wages paid. They may also appoint experts to assist the arbitrators in cases which present technical difficulties. A special voluntary board may always be substituted for the State board at the wish of the parties concerned, and this temporary body is endowed for the time being with all the powers which the act confers upon the permanent arbitrators. Two instances of the appointment of such a voluntary board are recorded in the Massachusetts report for 1887. . . . Laws providing for the settlement of disputes between employers and employed by arbitration have been enacted by the Congress of the United States, and the legislatures of Colorado, Maryland, New Jersey, Iowa, Michigan, and North Carolina, as well as the States previously mentioned. By an act of 1892, the Governor of New Jersey is authorized to appoint a State Board of Arbitration to hear appeals from local arbitration boards, as well as to arbitrate directly between employer and employed when the parties in dispute desire it, and to hold an inquiry into the cause of the controversy when they do not.

In 1888 Congress passed an act "for the creation of boards of arbitration or commission for settling controversies and differences between railroad corporations and other common carriers engaged in interstate and territorial transportation of property or passengers and their employes." Before such a board of arbitration can be constituted, one of the parties must submit in writing its wish to refer the dispute to arbitration, and this proposition must be accepted by the other party. The railroad company and the employes may then each select an arbitrator, and these two select a third, all three impartial and disinterested persons. The board thus constituted has power to subpoena and compel the attendance of witnesses, to administer oaths, and to require the production of papers and writings; but no witness is to be compelled to disclose the secrets or produce the records of any labour organization, a clause which would effectually protect the officials of the Knights of Labor. The parties examined may be represented by counsel. The President may select two commissioners, one of whom must reside in the district where the controversy has arisen. They, together with the Commissioner of Labour, examine into the causes of the controversy and the best means of adjusting it, and must report the result of such an inquiry to the President and to Congress. All the powers of the board may be delegated to these commissioners, and their decision must be immediately made public. But here, as in other cases in which State arbitration is provided for by law in the United States, no penalties are provided in case the parties refuse to accept the award, and there is, therefore, no sanction attached to the act other than such as may be constituted by a dread of public opinion. . . . It does not compel a settlement. . . . It is always possible for either party to declare that they have nothing to arbitrate. . . . In this case there is nothing to be done, but to publish an official statement of the circumstances, which may or may not have sufficient weight to bring about a settlement. The appointment of the United States Commission in regard to the Pullman strike was simply to investigate the facts and make recommendations for the future. It was not a committee of arbitration.

As regards the separate States, Kansas has an act copied from the Ohio law, but it has been pronounced by the Kansas Labor Commissioner to be a dead letter. The same fate has befallen most of the arbitration acts, and it is really only in Massachusetts and New York that the principle of arbitration can be said to be firmly established.

Even in Massachusetts, however, arbitration cannot be said to be very successful, though this is probably mainly due to the recent industrial depression. So says the last report (1895) of the Board of Arbitration.

Massachusetts' Last Report (1895).

"The differences which have arisen between employers and employes in this commonwealth during the year 1894 have been sufficiently numerous, and have made larger demands upon the time and attention of this board than in any former year. The uncertainty of the financial situation, apprehension of unfavorable results of proposed legislation, and a general failure of confidence throughout the business world were perhaps the principal causes of a depression, the like of which has not been known in this country for a century at least. One result of this unfortunate condition of things, as observed by this board, has been a general reduction in the rate of wages and amount of earnings all over the State.

"In some industries the reduction may be stated more or less definitely as so much per cent. In others, the rate of wages has remained nominally the same, or nearly the same, but a shortening of the working time has also had the effect of reducing the earnings. Reductions in wages, one following upon another, have been met by opposition and protests. Strikes have been frequent, but for the most part without effect.

"In particular instances, when the assistance of the board has been sought, it has succeeded in breaking in some degree the force of the blow, and in securing a promise of better wages when business should improve, but when manufacturers throughout the State were saying almost as one man that the market for their products was lifeless, and that in their judgment, as prudent men, it would be folly—in fact, an impossibility—to continue operations without a reduction in wages, it was very difficult for any one, even the most hopeful, to argue successfully against that position. The board could not be blind to the main facts, uncertainty and want of confidence. It could not alter the general conditions, and in many instances could only counsel a return to work on the ground that it was better to be at work with any wages than to be idle.

"This sort of advice is not always accepted. It looks like an admission of defeat, and generally amounts to that, and therefore is not likely to be accepted until the situation is clearly desperate.

"Whenever the parties to a controversy have been willing to accept a fair settlement, arbitration and conciliation have produced results as beneficial as ever to all concerned. When settlements have been reached in this way, there has been no cessation of business and no loss of earnings while the matters in dispute were under consideration.

"On the other hand, it is safe to say that every strike that has been either wholly or partially successful has cost the winners far more than the results were worth, and subject the employer to great trouble and anxiety as well as pecuniary loss. It is simple justice to add that some of the strikes which have occurred during the year have been preceded by offers from workmen, apparently made in good faith, to submit the questions at issue to arbitration either by the State board or by a board to be selected by the parties for themselves. During the last year, the employés have been relatively more favorable to arbitration than employers."

Very recently the great strikes on railroads and local transit systems have led to a renewed discussion of arbitration in such cases. The commission appointed to investigate the Pullman strike has reported the following recommendations:

"1. The commission would suggest the consideration by the States of the adoption of some system of conciliation and arbitration like that, for instance, in use in the commonwealth of Massachusetts. That system might be re-enforced by additional provisions giving the board of arbitration more power to investigate all strikes, whether requested so to do or not, and the question might be considered as to giving labor organizations a standing before the law, as heretofore suggested for national trade-unions. 2. Contracts requiring men to agree not to join labor organizations or to leave them, as conditions of employment, should be made illegal, as is already done in some of our States. 3. The commission urges employers to recognize labor organizations; that such organizations be dealt with through representatives, with special reference to conciliation and arbitration when difficulties are threatened or arise. It is satisfied that employers should come in closer touch with labor and should recognize that, while the interests of labor and capital are not identical, they are reciprocal. 4. The commission is satisfied that if employers everywhere will endeavor to act in concert with labor; that if when wages can be raised under economic conditions they be raised voluntarily, and that if when there are reductions reasons be given for the reduction, much friction can be avoided. It is also satisfied that if employers will consider employés as thoroughly essential to industrial success as capital, and thus take labor into consultation at proper times, much of the severity of strikes can be tempered and their number reduced."

A bill embodying these recommendations has been introduced into Congress (see PULLMAN STRIKE), and the New York State Board of Arbitration has made similar recommendations in the case of the strike on the Brooklyn trolley cars.

Perhaps the best example of the successful adoption of the principle of conciliation in the United States occurs among the bricklayers of New York City. Mrs. J. S. Lowell says in an article in *The Voice*, April 4, 1895:

"The bricklayers of New York, belonging to eight strong trade-unions, and numbering 4000 men, have not lost one hour of work, either by strike on their own part or lockout on the part of their employers, during the past 10 years. The reason is simple, when one knows it, and the matter for wonder is that the example has not been followed in all other trades in this city.

"In the summer of 1884 the bricklayers struck for three months for a nine-hour day and failed, and that experiment, in addition to others in the past of the same kind, was enough for them and enough for their employers, and in the spring of 1885 there was formed by the Mason Builders' Association and the bricklayers' unions a Joint Arbitration Committee, 'to meet every Wednesday evening, to hear grievances and settle all disputes between employers and employées.' This joint committee has continued in existence until now (10 years on March 24), and each year an agreement as to wages, hours of work, overtime, holidays, and other matters of mutual interest, has been made by the committee, composed of equal numbers of employers and of employées, the former representing the Mason Builders' Association, the latter the eight bricklayers' unions.

An Example in New York.

Wednesday evening, to hear grievances and settle all disputes between employers and employées." This joint committee has continued in existence until now (10 years on March 24), and each year an agreement as to wages, hours of work, overtime, holidays, and other matters of mutual interest, has been made by the committee, composed of equal numbers of employers and of employées, the former representing the Mason Builders' Association, the latter the eight bricklayers' unions.

"Besides the annual agreements, the committee settles questions arising between individual employées and employés; and the fact that no strike and no lockout has occurred between the members of the organizations represented on the joint committee since its establishment seems to show that these men at least have found the way to avoid 'labor differences.'

"On the formation of the committee, it was provided that in case of non-agreement an umpire should be chosen; but it has never been necessary to choose an umpire, which says much for the reasonableness and justice of the members of the committee.

"When the first annual agreement was made in 1885, it provided that wages to May, 1886, should be 42 cents per hour, and that the working-day should be nine hours; the agreement from May, 1894, to May, 1895, provided that wages should be 50 cents per hour, and that the working day should be eight hours. These gains have been made, as has been said, without loss of work by either strike or lockout, and without ill-feeling on either side."

Gains Under the Agreement.

In New York City also, we find an illustration of what a board of conciliation can do, even though organized by a body outside any one trade. The Church Association for the Advancement of the Interests of Labor, a Protestant Episcopal organization, in New York, organized three years ago a Council of Conciliation and Mediation, with Bishop Potter as its president, with one working man and one business man as other members. It has been active and useful on more than one occasion. Of its last success, *The Outlook* of March 30, 1895, says:

"Through the offices of the volunteer Council of Conciliation and Mediation, of which Bishop Potter is president, an agreement was reached between the Electrical Contractors' Association and the Electrical Workers' Union by which the employers granted an eight-hour day, to begin May 1, while the men consented to the continued employment of all those who had taken their places during the strike, provided these new men could pass an examination as to competency 'in accordance with the rule hitherto prevailing in the trade.' The number of electrical workers involved in this strike was not very great, but the unions in all but one of the allied building trades had decided to support the electrical workers, and at one time the strike threatened to assume disastrous proportions. When the Board of Mediation began its investigation, it found that neither side understood the other's position. Each side had approached the other with statements of how little it was willing to do, but both approached the Council, in which each had confidence, with statements of how much they were willing to do. The difference between these methods turned out to be all the difference between a basis of war and a basis of peace."

III. DIFFICULTIES OF, ARGUMENTS FOR, AND VIEWS HELD AS TO ARBITRATION AND CONCILIATION.

Such, in brief, is the history of industrial arbitration and conciliation. It suggests various conclusions to various minds. Of the theoretical and, to a less extent, the practical value of arbitration and conciliation all are agreed, tho to some the difficulties seem insurmountable. A few points in regard to the difficulties must firm- Difficulties.

ly be kept in mind: (1) The opposition to and difficulties in the way of arbitration and conciliation do not spring from either side alone. It is certainly not from the side of the employée that the greatest opposition has come, tho, as we shall in a moment see, there may be especial and not inadequate reasons which make employers particularly unwilling to adopt arbitration. Nevertheless, it should be noted that organized labor almost invariably has been willing to submit to arbitration rather than attempt a strike.

Says Professor R. T. Ely (*The Labor Movement in America*, p. 146):

"The difficulties in the way of arbitration have come chiefly from the side of employers, for it is a rare thing when laborers refuse to arbitrate their difficulties with their employers. Few cases of such refusal have ever come under my notice."

Almost all labor platforms favor arbitration.

"One of the aims of the Knights of Labor, as found in their declaration of principles, is: 'To persuade all employers to agree to arbitrate all differences which may arise between them and their employees, in order that the bonds of sympathy between them may be strengthened, and that strikes may be rendered unnecessary.'"

Says the Constitution of the Brotherhood of Carpenters and Joiners, Art. 9, Sec. 1:

"Whenever a dispute arises between an employer or employers and members of this brotherhood, the members shall lay the matter before the local union, which shall appoint an arbitration committee to adjust the difficulty; then, if said committee cannot settle the dispute, the matter shall be referred to the union."

The International Typographical Union recommends that—

"When disputes arise between subordinate unions and employers which cannot be adjusted after conference between the parties at issue, the matter be then settled by arbitration." And in another place the constitution of this body contains these words: "Recognizing strikes as detrimental to the best interests of the craft, it directs subordinate unions not to order a strike until every possible effort has been made to settle the difficulty by arbitration."

Among the standing resolutions of the Iron Moulders' Union is this:

"Resolved, that strikes are not beneficial to our organization, and that it would be to our interest to evade as much as possible all strikes, and not to resort to them until all other means at our disposal are exhausted."

The question may then be asked, If labor organizations are so much in favor of arbitration and so much opposed to strikes, why do strikes occur so often?

To this it may be answered, (1) just because employers will not arbitrate. (2) Almost all careful thinkers are agreed to-day that occasionally strikes are justified if the laborer is to raise his condition. Under competition only a determined and united stand on the part of the laborer, sometimes carried to the length of a bitter strike, can prevent the lowering of wages. (See STRIKES.) The fact of a strike, therefore, by no means proves the unwillingness of the laborer to resort to arbitration.

Nevertheless, all the fault does not lie by any manner of means on the part of the employers. Strikes, and sometimes great strikes, are often precipitated, not usually, indeed, by the labor agitator or paid secretary (tho this, of course, sometimes happens), but by the heat and passion and ignorant thoughtlessness of the rank and file of a labor union, who, smarting under a real or fancied grievance, will not take into consideration either involved conditions, extenuating circumstances, or the advice of sober leaders, but will rashly vote a strike, and then sometimes appeal to arbitration after they have struck. It not unfrequently happens, as is reported to have been the case with Mr. Debs in the Pullman strike, that the leader of a union does all he can to prevent a strike, is outvoted in the union, and thus finds himself forced, as an officer of an organization, to carry on and manage a strike which he has tried to prevent. Such a situation is held by some to illustrate the tyranny of trade-unionism; but it is to be questioned whether submission to organization and obedience to its vote is

not better in the long run than lack of organization, even tho at times it does compel the individual to act contrary to his own choice. Be this as it may, there is no question that one of the difficulties in the way of arbitration and conciliation, and especially in the way of getting bodies of men to submit to unfavorable decisions of arbitrating bodies, lies in the hasty spirit of embittered members of labor unions smarting under low wages and harsh conditions.

The greater opposition, too, that employers show to arbitration can be easily explained. They argue that, whether the present system be right or not, under this system industry is conducted **Employers' Opposition.** by individuals, and *as long as this be so*, the individual must be left free to manage his own business in his own way. If the community adopts socialism, that is another thing; but unless a community adopts socialism, with all that it involves—of evil as well as of good—the individual, they claim, must be left free to manage his business as best he can. The interference of outside parties, they declare, is intolerable. "We have the responsibility," they say; "we must have the power." Hence they often resent the interference of arbitrating boards even in cases where they may admit there has been injustice on the side of the employer. They argue that the employer should be quietly induced to adjust the wrong; but to adopt arbitration is to adopt a principle contrary to the present system and one that cannot work under it.

In the discussions arising during the great Pullman strike, it was said by many railroad men that when Government control of railroads was proposed, that that was all very well; but that if Government did undertake to control, it must go on and also own. Many business men feel that if arbitration become the rule, private conduct of business is at an end. Still more object to boards of conciliation because of their experience with what they consider the ignorant and unreasonable conduct of labor organizations. They object, not to organizations, but to *such* organizations. They refuse to recognize the organizations of their employees, they assert, simply because they cannot do so and run their business. It is with them not a matter of choice, but of necessity.

This leads to the third and main difficulty with conciliation and arbitration—the difficulty presented by the Massachusetts report, quoted above. Wages fall owing to universal industrial conditions. Wage-earners become dissatisfied and strike, or appeal to arbitration. It may not be the fault of the wage-earners; they may be striking against a lowering of wages that does bring living below the level even of human endurance. The arbitration board to which the wage-earners appeal may feel this. Nevertheless, what can it do? The trouble lies neither with the employers nor employees, but with general conditions, and these arbitration cannot change. All the board can do, then, is to urge the wage-workers to submit, and this but increases the unrest and dissatisfaction. There is no question that this, in such general industrial conditions, is the main reason why, although we find an increasing willingness to arbitrate,

arbitration so often fails. From this state of affairs socialists draw the conclusion that what is needed is not arbitration, but a change of system, and they often denounce arbitration and conciliation as reactionary measures. It is claimed by some that the hope of the movement lies in compulsory arbitration. Says

Mr. Reeves, in the article quoted above :

"I have already shown how unsatisfactory is the result of leaving the parties themselves to be led by their own good sense. That has been earnestly urged and patiently tried for many years in England. What is the outcome? We may sum it up as 4300 strikes in the last five years. In the United States the picture is even darker. There mercenaries shoot down strikers, unpopular managers are assassinated, the militia has to be called out, unionists are put on their trial, charged with poisoning blacklegs. Matters are not so bad in Australia, but is either side in the colonies satisfied with the position? I doubt it; the banking crisis, and the partial collapse following thereupon, having made striking for the present a hopeless game. The employers have been emboldened by their success in refusing arbitration, previous to their victories of 1890, to make a practice of refusal. They do as they did in the Queensland Shearers' strike and at Broken Hill. In New South Wales, as in New Zealand, certain employers have gone so far as to decline to recognize unions, and to avoid engaging unionists. But unionism is neither dead nor dying for all that. The present state of things in Australia cannot last, and the people will be wise to take this opportunity of arranging a substitute for industrial tugs-of-war.

"If any one could show a single settlement of a labor quarrel brought about by the Victorian or New South Wales acts, or by all the well-meaning speeches made in New Zealand in favor of optional conciliation boards, I would admit that there is something to be said both for private conciliation and for legislation of the weak-kneed order. But as the Victorian act has been useless, and the New South Wales act worse than useless, and as a New Zealand employer of standing stated last winter to a Parliamentary committee that he could not recall a single labor quarrel in the colony that had been composed by private arbitration, it would seem that we must be bolder if we wish to be effectual.

"The day is gone by for arguments against the right of the State to intervene in labor disputes or even against the expediency of its doing so. The case for intervention was put so pithily and clearly by the New South Wales Commission on Strikes in 1890 that I need not try to vary their language. 'No quarrel should be allowed to fester if either party were willing to accept a settlement by the State tribunal. Industrial quarrels cannot continue without the risk of their growing to dangerous dimensions, and the State has a right in the public interest to call upon all who are protected by the laws to conform to any provision the law may establish for settling quarrels dangerous to the public peace.' Pity that the commission did not advise, or New South Wales Parliament enact, a law effectual to give force to this admirable declaration of principle. I scarcely need then at this time of day to combat the suggestion, once made by a respectable English statesman, that the sole duty of the State in relation to labor quarrels is to 'keep the ring.' The wisdom of a householder who might allow his family and servants to settle a domestic dispute by smashing the furniture and each other, while he contentedly locked the front door and kept strangers from the door-step, would not impress any one. But it would be about on a par with that of the upholders of absolute non-intervention by the State in the worst class of strikes and lock-outs.

"If we are forced to see that voluntary arbitration by systematic private arrangement has had, at best, a very partial success in England and none elsewhere, we must turn to the State. If we are compelled to admit that State voluntary systems, inadequate in America, have been still-born in England, New South Wales, Victoria, and Germany, we must fall back on compulsion. If we are driven to pronounce the use of compulsion in France in settling minor disputes uniformly successful, we may in reason suggest that the experiment of applying compulsion to major disputes be fairly tried.

"We are told that compulsory arbitration would fail because the arbitrators would be ignorant of the business technicalities of the trades brought into court,

But our law courts go into such details every day, and with the aid of expert evidence usually contrive to comprehend them. It is objected that no compulsion could force an unwilling master to keep his factory open, or men to work unless they choose.

Of course not; but a court can affix a penalty to an award and make a recalcitrant owner or union and its members pay. Moreover, in these countries people do not defy the law. If it is intolerable, they agitate to have it amended; and if it works injustice it is amended. We are assured that business men will not allow a court to regulate their methods of management. But the directors and shareholders of registered companies now constantly submit to the keenest scrutiny of their affairs and the most searching interference therein by judges. We are warned that compulsory arbitration will be resented as an unwarrantable interference with the liberty of the subject. The same has been said of Factory acts, Truck acts, Mining, Shop Hours, Employers' Liability, Workmen's Wages, Ten Hours acts, *et hoc genus omne*. Yet all these are accepted and obeyed. In the 'Ann Arbor' case, an American court forbade boycotting on railways. The other day a judge ordered the servants of the Union Pacific Railway to accept a 10 per cent reduction, and not to strike. I cannot learn that these injunctions caused a civil war. Alarming pictures are drawn of tyrannical awards, under which factory owners will be forced to carry on at a ruinous loss or men ordered to labor at less than a living wage. Granted that an arbitration court be insane; given a lunatic president flanked by two crazy assessors, and I will admit that the awards might speedily cause a revolt. But under the same conditions an ordinary law court might do the same. We are justified in assuming that a president appointed by the State would be swayed by reason, and that assessors, elected by unions of employers and workmen respectively, would be men of more than average good sense. To the objection that an examination by arbitrators of a firm's books cannot be thought of, it may be answered that this applies to voluntary arbitration just as much as the other sort. If it is unreasonable in the one case, it is so in the other. But one of the most useful of English voluntary boards reports that the repugnance of employers to this inspection has been slowly overcome. A weightier argument is that reckless and irresponsible workmen might continually harass masters by dragging them before courts and boards. The remedy to this would be found by confining the functions of the arbitration court and local conciliation boards to settling differences between masters and trades-unions or registered associations of laborers. A little reflection will show that to allow any roving workman, or half-dozen workmen, to take their master of a day or a week into court over some twopenny halfpenny quarrel would make a mockery of any arbitration system. Registered unions have something to lose—funds, influence over their members, a character among workers generally. They would not be likely to run the risk of being mulcted in costs for the sake of trifles, and of seeing their union's funds seized or a levy made upon their members. Even were they reckless at the outset, one or two experiences would soon teach them better. The Compulsory Arbitration Act that regulates the Nova Scotia mines allows the court to order

an employer to pay into court a certain sum for himself. Thus can security for costs be obtained from both sides in a case. To such safeguards should be added district conciliation boards elected by masters and unions. These, unfurnished with compulsory powers, would stand as a buffer between disputants and the arbitration court. The latter should be reserved for serious conflicts, and for cases where the good offices of the boards have failed. I am sanguine enough to think that they would not often fail when the alternative to accepting them would be an appearance before the more formal, costly, and distant court of arbitration. In France and Massachusetts, of course, conciliation and arbitration are undertaken by the same body. On the whole, however, it would perhaps be wiser to separate them, excellent as such a board as that of Massachusetts would be with the addition of compulsion. . . .

"The general election in New Zealand has insured the passing of a Compulsory Arbitration act within the next six months, and I venture to think that New Zealand is in this likely to be but a step ahead of the continental colonies. To those of us who think this experiment inevitable, it seems of more moment to study the methods of making it than to attend to primitive out-

Can Awards be Enforced?

Argument.

cries against socialistic interference with the liberty of the subject. . . ."

On the other hand, Mr. Carroll D. Wright, Commissioner of Labor of the United States, makes a strong argument against compulsory and for voluntary arbitration. Says

**Argument
against
Compulsory
Arbitration.**

Mr. Wright in the *Forum* for May, 1893, in an article entitled *Compulsory Arbitration an Impossible Remedy*: "The settlement of disputes arising between employers and employed, by such means as will insure the peaceful cooperation of both parties, is a result which should be hailed by all as a step in advance, and indicates, whenever tried, a desire to adjust those questions which have been so fruitful of strikes and consequent distress."

Mr. Wright then goes on to show how voluntary arbitration can, and compulsory arbitration cannot, work. He says:

"Coming to specific regulations which must exist in some form under any system of compulsory arbitration, the difficulties begin to appear and the obstacles grow apparently insurmountable. In the first place, the court must either be one consisting of judges authorized to hear the facts, determine the law, enter the judgment, and enforce it; or one having the right to summon a jury to determine the facts, the court having the power to pass the judgment and enforce its decision. It does not matter which form might be adopted; the court would have to be one of the rank of the county courts of the country, from which appeals can be made to the highest court of a State, and in interstate difficulties from the lower federal courts to the Supreme Court of the United States.

"In the initiative, let it be supposed that A represents the employer. He issues an order to his employees that wages will be reduced 10 per cent. on a certain day. For the sake of easy calculation, let it be supposed that the wages are \$2 per day, on the average, in A's works. His proposed reduction then, if carried out, would leave wages at \$1.80 per day. The workmen resist this proposition, and insist that they will work no longer for him unless the \$2 per day can be retained. But A issues his order, and the workmen strike. A then appeals to the court of arbitration for his locality, and a summons is issued under the seal of the court, citing the workmen to appear and answer as to why the demands of the order of A should not be obeyed. If they appear and make answer, all well and good. If they do not, then they will be subject to judgment by default; or, in some cases, the proper officers of the court may bring them bodily into court to answer the allegations of A. But they are brought into court. A presents his case, the employees present theirs, the court makes a decision and upholds A, deciding that he is justified in cutting down the wages of his workmen 10 per cent., reducing them from \$2 per day to \$1.80.

"Now two results may follow this action. The men, under the decision of the court, acquiesce and return to work at \$1.80 per day, or they refuse to return to work at that price. Then comes the execution of the judgment of the court if the workmen will not obey that judgment. It is levied on them personally or on their property by proper process and by the proper officers of the court. They may be arrested and brought into the factory. If the sheriff or the single officer authorized to serve the execution cannot do it alone he can summon the *posse comitatus*. If the posse be insufficient he can appeal to the governor. The order of the court must be enforced, and all the power of the government brought to enforce it. This means compulsion, and at the point of the bayonet. The men must accede to the decision of the court of arbitration and work for \$1.80 per day, whether they will or not.

"Let us instance the reverse. The court decides against A, and the judgment is that he shall pay \$2 per day. He declines to do so, or he does not obey the judgment of the court. Execution then follows, and is served by the proper officer. If he cannot serve it alone he summons the *posse comitatus*. If the posse be insufficient the officer appeals to the governor of the State, and A must continue his works and with wages at \$2 per day under the persuading influence of loaded

rifles, or the execution may be levied on his property. He must obey, under the rule of compulsory arbitration, the order of the court." In other words, he must pay \$2 per day when, it may be, the market cannot be supplied with goods on any such basis. He cannot close his works without disobeying the order of the court; he cannot pay the \$2 per day without loss of his property. Compulsory arbitration then works confiscation. In either of these instances law has stepped in to fix arbitrarily, and to enforce its fixing by all the civil and military power of the State, either the price at which a man shall sell his labor, under penalties, or the price at which the producer shall sell his goods, under penalties. But the plan does not provide that the consumer shall purchase goods at the fixed price, under penalties, which should be done if there is any logic in compulsory arbitration.

"What further may occur? The employer submits, it may be, to the judgment of the court, continues the operation of his works, and pays the \$2 per day, as ordered by law, altho he knows perfectly well that he cannot sell his goods if he disobeys the law. He therefore has two things to which he can resort: 1. Adulterate his goods to such an extent that he recoups a loss of 10 per cent. in wages; 2. Make a 'combine' with all other manufacturers of like goods to control prices, in order that whenever a court of arbitration decides that certain wages shall be paid there will be no competition, the trust or 'combine' regulating the price in accordance with the decrees of the court, and therefore caring nothing what the decrees may be, because the consumer must bear the expense of the decree. This means the highest, even prohibitive, rates of duty. Or another economic condition may be the result of the decree of the court. A submits to the decision and continues to pay \$2 per day, and tries to sell his goods in the old way. This allows his neighbor to enter into dangerous competition with him until such time as he is summoned into court and is compelled to abide by the same rules, it thus taking but little time to force the whole industry involved into the trust organization. If the illustration be reversed in all cases to apply to men who strike for higher pay, thus becoming the plaintiff in the action and summoning the manufacturer, the manufacturer must appear or lose the case by default, or, if he does appear, be subject to the decision of the court. It may be a rise of wages would follow, when all the results just indicated would be met.

"It does not require much stretch of the imagination to see that as each industry becomes involved in the economic results of compulsory arbitration, combination grows more and more severe in all its terms. Every great industry would be forced into the trust through the action of the sheriff, or the *posse comitatus* under him, or the military force of the State enforcing the decision of its courts, which it is bound to do. The trust represents consolidation, and, in the minds of leading socialists, is but the stepping-stone to State socialism. If the trust be honest and faithfully administered in the interests of the public—and this must be the result, or the trust must go under—the State socialist asks, Why not create a greater trust and have the Government itself the trustee? This is not the place to argue such a question, but the question may be asked here whether the advocates of compulsory arbitration are ready to accept the full and logical conclusion of their system by forcing, at the point of the bayonet, all industries under State control, and thereby establish, by military force, the rule of State socialism?

"How much simpler it would be to enact a law, with proper penalties, establishing the prices of goods and the wages of all labor. Then when any one, a manufacturer, or a seller, or a laborer, violated the law he could be prosecuted in a criminal court and the proper penalty applied. This would do away with all the cumbersome machinery of the court of compulsory arbitration and accomplish precisely the same result—the death of industry."

What Mr. Wright does advocate may be seen by his recommendation of voluntary arbitration quoted in Part II. of this article. Most trade-unionists agree with Mr. Wright in opposing compulsory arbitration. Mr. John B. Lennon, Treasurer of the American Federation of Labor, writes in *The Independent* for May 2, 1895:

"We believe in arbitration if it be voluntary. But we have more faith in conciliation, in the settling of disputes or threatened disputes before they reach the

stage of the strike. The Federation is unqualifiedly committed against compulsory or legal arbitration. We object to this method of arbitration primarily, because it is not arbitration. Arbitration means a peaceful settlement; compulsion means force. And we do not believe it to be the province of the Government to interfere, or so commence to take part in the settlement of these trade questions, believing that neither Congress nor the State legislatures have the necessary technical knowledge relating to the different crafts; nor is it possible for them to have such knowledge as would enable them to settle trade disputes on just and fair grounds. We object to compulsory arbitration, as the introduction, in a degree at least, of a system of slavery; as, if compulsory, it must be followed by penalties which would probably make it a penal offense for a man to quit work or to continue it if a board of arbitration should have decided against him. We also consider such a method inconsistent with the principles of our American Government and with the actual rights of men."

Such are some of the arguments *pro* and *con* for various kinds of arbitration. Yet arbitration of some kind all would favor, saving only those

extreme socialists who consider everything reactionary which does

Opinions. not immediately introduce socialism.

All others agree that labor and capital must be friends, not enemies, and that this can be reached only by each side understanding each other, to which end nothing can more conduce than coming together, in case of industrial disputes, for friendly arbitration, or, better still, in permanent boards of conciliation before disputes have arisen.

Professor J. B. Clark, Smith College, Northampton, Mass., says:

"Arbitration is in itself an appeal to equity and a departure from the competitive principle."

Professor Henry C. Adams, Lecturer on Political Economy in the University of Michigan and Cornell University, says:

"Arbitration is not the missing coupling between labor and capital, but it is the thing for which, at the present time, it is practical that working men should strive. Its establishment is the first step toward the overthrow of the wages system."

Professor E. J. James, of the University of Pennsylvania (Philadelphia), says:

"Arbitration has the great advantage of subjecting the acts of the parties to it to the efficient and powerful control of an energetic public opinion. It recognizes indirectly—what is too often overlooked—that the interests at stake are not merely those of the laborer and employer, but also those of the community at large. The latter has such a great stake in the contest that it cannot afford to stand idly by and permit the former to disturb society to its foundations, and destroy in their struggle the very conditions of sound economic progress."

John Jarrett, Esq., Secretary of the American Tinned-Plate Association, says:

"I know of no better remedy, in the adjustment of all differences that may arise between employers and employees, than arbitration and conciliation."

Hon. Joel B. McCamant, Chief of Bureau of Industrial Statistics, State of Pennsylvania, says:

"Arbitration, in my opinion, is the only reasonable coupling between labor and capital."

The first step to arbitration is organization, both of employers and employees.

Says Dr. Gould, in a recent article in the *Yale Review*, February, 1895:

"A ready-made, perfectly adjusted, inelastic method or agency for settling collective industrial difficulties, embodying at the same time ideas of abstract justice, cannot be devised. A *modus vivendi*, however, can be reached, but it must respond to underlying interests and harmonize with national traditions and necessities. Advance must be progressive, for the problem is educational as well as practical. The very first step is organization by both of the two parties to industry."

Says Mrs. J. S. Lowell:

"Labor differences arise because labor or capital (or sometimes both) fail to recognize the fundamental facts of their relationship, which are that they are both interested in all questions of wages, of hours, and of conditions of work; that they both have equal rights in regard to them; and that both must, therefore, have an equal voice in settling them.

"Sometimes it is the employer who posts a notice in the factory that, after a certain date, wages are to be so and so and hours such and such. The changes may be necessary; but it is not to be expected that intelligent, independent American citizens will tamely accept conditions about which they have not been consulted, and which have been promulgated as the Czar of Russia promulgates his decrees, and consequently there follows a strike which might have been avoided by the practise of a little common sense and common courtesy on the part of the employer.

"On the other hand, the same spirit is not infrequently shown by the union or the local assembly. An employer, who has made his business agreements upon the understanding that existing conditions are to continue, is suddenly confronted with the statement that his employees have adopted new working rules, and that within a few days those working rules will go into effect. Here again temper may have something to do with the action of the employer, but the sympathy of the unprejudiced observer must be with him when he resents such arbitrary action and claims his right to be consulted as to the conditions under which work in his establishment is to be done. The fault is exactly the same and exactly equal in these two cases, and arises from a wrong way of looking at the question.

"What is the remedy? A recognition on the part of both employer and employee of the rights of the other side—that is, a sense of justice and a desire to deal justly. Neither side can throw stones; both can show instances of wrongdoing and of rightdoing, but unfortunately when one side is right the other side is apt to be wrong on any particular occasion, and so the 'labor differences' multiply.

"There are instances, however, where both sides have the right spirit, where the equal rights of both sides are mutually recognized, and then there is truly 'nothing to arbitrate,' not because of unwillingness on the part of the employer or employee, but because there really are no 'differences' between them. But where such conditions of mutual confidence and respect exist, the public knows nothing at all about

it, for there is nothing to excite public interest ; and whereas every little strike of a few hundred men is known and chronicled, the peaceful relations of thousands of men and their employers and the sure foundation upon which it is based are scarcely known beyond the walls of the room where the representatives discuss and settle all questions of common interest."

Says Professor R. T. Ely :

"Arbitration is impossible without labor organizations. Capital is combined and is managed by a few persons even in the largest establishments. Take the case of a railway corporation. The capital may be owned by 1000 different persons, but it is massed together, and all its owners, as a rule, treat with the railway employers through a single person. Capital is one of the factors of production ; labor is another, and it also must be massed together to stand on an equal footing, and this can be effected only by organization. As the 1000 capitalists choose one representative, the 10,000 laborers must choose a representative of labor. To ask a single laborer, representing a ten-thousandth part of the labor factor, to place himself against a man who represents all the combined capital, is as absurd as to place a boy before an express train and expect him to stop its progress. As Hon. Abram S. Hewitt, as every one knows, a wealthy employer, has so well said, it is only after labor is organized that the contending parties are in a condition to treat. 'The great result is that capital is ready to discuss. It is not to be disguised that, until labor presented itself in such an attitude as to compel a hearing, capital was not willing to listen, but now it does listen.'"

Many trade-unionists fear boards of arbitration appointed by the State, since government to-day they consider almost wholly in the hands of the dreaded "capitalist." At the recent annual convention of the English Miners' Federation it was stated that the Federation had been started to uphold the right of the miner to a voice in the adjudication of the value of his labor, and they had no confidence in the arbitration of men belonging to the capitalist class. The president said he had never met with any settlement by arbitration which gave general satisfaction. Undoubtedly the first step to making boards of arbitration and conciliation succeed is to make them fair and above suspicion.

ARBOR DAY.—A certain day in the year appointed by the State, in which people are asked and encouraged to plant trees in order to counteract the tendency to forest exhaustion. (See FORESTRY.) To the Nebraska State Board

of Agriculture belongs the honor of recommending, in 1879, the first Arbor Day, which was to be the second Wednesday of April in each year. To-day 38 States and Territories celebrate Arbor Day.

ARCH, JOSEPH, leader of the English agricultural laborers' movement, 1870-83, and President of the National Agricultural Laborers' Union (1872), of which he was the chief founder. He was the son of a laborer, and worked on the farm himself from an early age. For some years he used his spare time preaching for the Primitive Methodists, and when the movement began among the agricultural laborers he used his talent on their behalf, soon being recognized as a leader. He was four times a candidate for parliamentary honors, but was successful only when he stood as the nominee of the Liberal Party for Northwest Norfolk in 1885, and again in 1892 and 1895, after a defeat in 1886.

ARISTOCRACY (Gr. *ἀριστος*, best, and *κρατία*, rule) means literally government by the best ; but in ordinary use, by "the best" is too often meant simply "the highest in rank and in opulence;" so that the word has come to mean a government where the supreme power is exercised by those highest in station, inheritance, blood, or wealth. It is in this sense claimed by almost all leaders of reform movements and by many others that the United States is more of an aristocracy to-day than of a democracy. Of the 82 members of the Senate of 1891-92, 69 were lawyers, and of the 335 members of the House 231 were lawyers ; and these lawyers were almost exclusively, by their antecedents, interests, etc., representatives of the possessing classes alone. Dr. Josiah Strong, in his book, *Our Country*, says :

"Every nation has its aristocracy. In other lands the aristocracy is one of birth; in ours it is one of wealth. It is useless for us to protest that we are democratic, and to plead the leveling character of our institutions. There is among us an aristocracy of recognized power, and that aristocracy is one of wealth. No heraldry offends our republican prejudices. Our ensigns armorial are the trade-mark. Our laws and customs recognize no noble titles; but men can forego the husk of a title who possess the fat ears of power. In England there is an eager ambition to rise in rank, an ambition as rarely gratified as it is commonly experienced. With us, aspiration meets with no such iron check as birth. A man has only to build higher the pedestal of his wealth. He may stand as high as he can build. His wealth cannot secure to him genuine respect, to be sure; but, for that matter, neither can birth. It will secure to him an obsequious deference. It may purchase political distinction. It is power. In the Old World men commonly live and die in the condition in which they are born. The peasant may be discontented, may covet what is beyond his reach; but his desire draws no strength from expectation. Heretofore, in this country, almost any laborer, by industry and economy, might gain a competence, and even a measure of wealth; and tho now we are beginning to approximate the conditions of European labor, young men, generally, when they start in life, still expect to become rich; and, thinking not to serve their god for naught, they commonly become faithful votaries of Mammon. Thus the prizes of wealth in the United States, being at the same time greater and more easily won, and the lists being open to all comers, the rush is more general and the race more eager than elsewhere. . . . Where land is being rapidly taken, and real estate of all sorts is rapidly appreciating in value, men make every possible present endeavor with reference to the future. Under such conditions the race after wealth becomes

peculiarly eager. The gambling spirit, which always prevails in mining regions, exerts a wide influence, even in agricultural States. Farmers often rent land, put their entire capital into a great acreage, and stake everything on a single crop. The sudden wealth often realized in the mines stimulates the general haste to be rich. And where riches are almost the sole object of endeavor, their possession gives greater power. In the Rocky Mountains a man may be to-day a caterer or bartender, fit for that and nothing more; to-morrow, without any good wit of his own, a millionaire; next day, because 'Mammon wins his way where seraphs might despair,' a lieutenant-governor or United States Senator."

But there is another side to this question. It is becoming more and more doubtful whether it is possible, under ordinary circumstances, to acquire wealth to-day, unless one is already born to wealth, inheriting it or acquiring it in some speculative way. Concerning this, see **ABSTINENCE, REWARD OF; WEALTH, etc.** The following passage from John Stuart Mill (*Fortnightly Review*, February, 1879) bears upon this point:

"The very idea of distributing justice, or of any proportionality between success and merit or between success and exertion, is in the present state of society so manifestly chimerical as to be relegated to the regions of romance. It is true that the lot of individuals is not wholly independent of their virtue and intelligence; these do really tell in their favour, but far less than many other things in which there is no merit at all. The most powerful of all the determining circumstances is birth. The great majority are what they were born to be. Some are born rich without work, others are born to a position in which they can become rich by work, the great majority are born to hard work and poverty throughout life, numbers to indigence. Next to birth the chief cause of success in life is accident and opportunity. When a person not born to riches succeeds in acquiring them, his own industry and dexterity have generally contributed to the result; but industry and dexterity would not have sufficed unless there had been also a concurrence of occasions and chances which falls to the lot of only a small number. If persons are helped in their worldly career by their virtues, so are they, and perhaps quite as often, by their vices; by servility and sycophancy, by hard-hearted and close-fisted selfishness, by the permitted lies and tricks of trade, by gambling speculations, not seldom by downright knavery. Energies and talents are of much more avail for success in life than virtues; but if one man succeeds by employing energy and talent in something generally useful, another thrives by exercising the same qualities in outgeneraling and ruining a rival. It is as much as any moralist ventures to assert, that, other circumstances being given, honesty is the best policy, and that with parity of advantages an honest person has better chances than a rogue. . . . The reward, instead of being perfected to the labour and abstinence of the individual, is almost in reverse ratio to it; those who receive the least labour and abstain the most."

(See also **DEMOCRACY; WEALTH, etc.**)

ARISTOTLE (384-322 B.C.), born at Stageira. He was a pupil of Plato at Athens, and said to have been called "the intellect of the school." After Plato's death (347 B.C.) Aristotle left Athens, and in 342 B.C. was invited to Macedonia by Philip, and became the teacher of Alexander. He remained here till Alexander started on his Asiatic expedition (334 B.C.), when he returned to Athens and opened a school called the Lyceum, and (from his practice of walking as he lectured) the "Peripatetic" school. He died at Chalcis in Euboea, aged 62. His main works are the *Nicomachean Ethics*, *Organon* or *Logic*, *Rhetoric*, *Poetics*, *Physics*, and *Politics*. His knowledge for his times was encyclopedic. His thorough knowledge of facts made him much more concrete and scientific, and as objective as Plato was idealistic and subjective. The following sum-

mary of his economic and sociologic positions is abridged from Professor Ingram's *History of Political Economy*, p. 16:

"Aristotle, like all the Greek thinkers, recognizes but one doctrine of the State, under which ethics, politics proper, and economics take their place as departments, bearing to each other a very close relation, and having, indeed, their lines of demarcation from each other not very distinctly marked. When wealth comes under consideration, it is studied not as an end in itself, but with a view to the higher elements and ultimate aims of the collective life.

"The origin of society he traces not to economic necessities, but to natural social impulses in the human constitution. The nature of the social union, when thus established, being determined by the partly spontaneous, partly systematic combination of diverse activities, he respects the independence of the latter while seeking to effect their convergence. He therefore opposes himself to the suppression of personal freedom and initiative, and the excessive subordination of the individual to the State, and rejects the community of property and wives proposed by Plato for his governing class. The principle of private property he regards as deeply rooted in man, and the evils which are alleged to result from the corresponding social ordinance he thinks ought really to be attributed either to the imperfections of our nature or to the vices of other public institutions. Community of goods must, in his view, tend to neglect of the common interest and to the disturbance of social harmony.

"Of the several classes which provide for the different wants of the society, those who are occupied directly with its material needs—the immediate cultivators of the soil, the mechanics and artificers—are excluded from any share in the government of the State, as being without the necessary leisure and cultivation, and apt to be debased by the nature of their occupations. In a celebrated passage he propounds a theory of slavery, in which it is based on the universality of the relation between command and obedience, and on the natural division by which the ruling is marked off from the subject race. He regards the slave as having no independent will, but as an 'animated tool' in the hands of his master; and in his subjection to such control, if only it be intelligent, Aristotle holds that the true well-being of the inferior as well as of the superior is to be found. This view, so shocking to our modern sentiment, is of course not personal to Aristotle; it is simply the theoretic presentation of the facts of Greek life, in which the existence of a body of citizens pursuing the higher culture and devoted to the tasks of war and government was founded on the systematic degradation of a wronged and despised class, excluded from all the higher offices of human beings, and sacrificed to the maintenance of a special type of society.

"The methods of economic acquisition are divided by Aristotle into two, one of which has for its aim the appropriation of natural products and their application to the material uses of the household; under this head come hunting, fishing, cattle-rearing, and agriculture. With this primary and 'natural' method is, in some sense, contrasted the other to which Aristotle gives the name of 'chrematistic,' in which an active exchange of products goes on, and money comes into operation as its medium and regulator. A certain measure of this 'non-natural' method, as it may be termed in opposition to the preceding and simpler form of industrial life, is accepted by Aristotle as a necessary extension of the latter, arising out of increased activity of intercourse, and satisfying real wants. But its development on the great scale, founded on the thirst for enjoyment and the unlimited desire of gain, he condemns as unworthy and corrupting. The his views on this subject appear to be principally based on moral grounds, there are some indications of his having entertained the erroneous opinion held by the physiocrats of the eighteenth century, that agriculture alone (with the kindred arts above joined with it) is truly productive, while the other kinds of industry, which either modify the products of nature or distribute them by way of exchange, however convenient and useful they may be, make no addition to the wealth of the community. . . .

"Like the other Greek social philosophers, Aristotle recommends to the care of governments the preservation of a due proportion between the extent of the civic territory and its population, and relies on antenuptial continence, late marriages, and the prevention or destruction of births for the due limitation of the number of citizens, the insufficiency of the latter

being dangerous to the independence and its superabundance to the tranquillity and good order of the State."

In his *Politics* (Book I, 2, §§ 12-14) Aristotle says: "The State is, by nature, clearly prior to the individual and to the family, since the whole is of necessity prior to the part. . . . The proof that the State is a creation of nature, and prior to the individual, is that the individual, when isolated, is not self-sufficing; and, therefore, he is like a part in relation to the whole. But he who is unable to live in society, or who has no need, because he is sufficient for himself, must be either a beast or a god."

ARMY AND NAVY.—However necessary standing armies and navies have been in the past, and to an extent may still be, the burden of their maintenance is one against which social science is more and more protesting. Just so far as true education and civilization prevail will the necessity for standing armies disappear. The United States, with its continental territory, its developing life, its varied population, and yet small standing army, is the wonder and envy of Europe.

The Commander-in-Chief of the United States Army is the President. The general in command is a major-general, with a salary of \$7500. The appropriation for the army for 1895 is \$23,529,885. The new United States Navy will consist of 28 armored vessels, 25 unarmored vessels, 12 unarmored wooden and iron ships, six torpedo-boats. Of these several are still building. Besides these are over 60 tugs, school-ships, small steamers, old vessels, etc. There are eight navy-yards. The navy of the United States is commanded by six rear-admirals, 10 commodores, 45 captains, 85 commanders and

74 lieutenant-commanders, 325 lieutenants, and 180 ensigns. There are 7500 enlisted men and 750 boys, besides a marine corps of 2175 officers and men. The appropriation for the navy for 1895 is \$25,327,127. The total expense of our government from 1789-1892 was, for war, \$4,824,758,797; for the navy, \$1,236,772,615. The militia of the United States numbers 117,537 officers and men.

The army of the United States in 1894 consisted of the following forces, in officers and men:

	Officers.	Enlisted Men.	Aggregate.
Ten cavalry regiments...	430	6,050	6,480
Five artillery regiments.	280	3,975	4,255
Twenty-five infantry regiments	875	12,925	13,800
Engineer battalion, recruiting parties, ordnance department, hospital service, Indian scouts, West Point, signal, and general service	552	2,782	3,333
Total.....	2,136	25,732	27,868

How Europe suffers under her standing armies can be seen by the following statistics, prepared for the *World Almanac* by Lieutenant W. R. Hamilton, Fifth Artillery, United States Army, and corrected from the latest official reports on file at the War Department, December, 1894:

LAND FORCES.

CLASSES.	Germany.	France.	Italy.	Austria-Hungary.	Russia.	Great Britain.	Turkey.
ACTIVE ARMY.							
Officers	22,494	26,995	15,285	18,467	30,124	138,410	9,769
Non-com. officers and men	557,093	524,837	247,944	386,588	1,112,684	13,680	179,396
Non-combatants.....	30,474	219,438	16,000	15,000	81,000	3,680
Horses	107,859	158,382	42,240	60,542	198,000	52,000	20,600
Guns	2,836	2,880	1,200	1,882	2,796	464	*2,312
Vehicles	34,000	40,000	15,000	20,000	21,500
RESERVES.							
Officers	23,986	21,820	13,134	15,160	43,830	901,350	270,189
Non-com. officers and men	3,151,389	3,099,733	2,393,359	1,158,993	4,693,761	724,903
Non-combatants.....	3,200	30,000	16,000

THE EUROPEAN MILITARY AND NAVAL BUDGETS
 For fiscal years ending during 1894 are put by the same authority at

COUNTRIES.	Cost of Armies.	Cost of Navies.	Pensions and Invalid Funds.	Total Military Budgets.	Equivalent in United States Money.
G. Britain and India.	£20,750,620	£15,270,500	£5,086,850	£41,107,790	\$199,794,734
Germany ..	430,350,500 marks.	48,300,720 marks.	69,472,300 marks.	548,123,520 marks.	130,453,398
France ..	646,162,700 francs.	225,381,200 francs.	900,000 francs.	872,443,900 francs.	161,381,073
Russia ..	276,291,300 roubles.	51,200,600 roubles.	327,491,900 roubles.	160,798,523
Italy ..	242,360,119 lire.	105,421,087 lire.	700,000 lire.	348,481,206 lire.	67,256,873
Austria-Hungary ...	129,500,313 florins.	12,592,617 florins.	26,342,800 florins.	168,445,730 florins.	57,439,994

These armies and navies, thus maintained at enormous cost, and increased from year to year—in Germany, for example, only after a long struggle with the representatives of the people—are a crushing burden on the tax-payer and a greater burden on the youth, who have to give their best years to war service. This service accounts largely for the emigration from Europe and the spread of socialism.

Service in all continental armies is compulsory on all able-bodied males between certain ages. The length of service and the age vary in different countries. Thus in France every Frenchman, upon reaching the age of 20, is liable to military service till he reaches the age of 40. In Germany every male is liable on

reaching the age of 17, and continues so till he reaches 45. Military service is of two kinds—active military service and occasional liability to military service. Each year a certain number of males reach the age of liability, and are enrolled for service. From their numbers are excused all who are morally and physically unfit, and then a certain number are transferred to non-combatant corps. All who actually serve throughout the entire year constitute the peace establishment. At the end of five years, their actual service having ceased, they are graduated soldiers, and are transferred to the first reserve; and after a few years' service in that to another reserve. All the graduated soldiers who are under the extreme age of 30 or 32 constitute the

active army—that is, they are the ones who, on breaking out of war, with the peace army, form the first great war army, and all the graduated soldiers between ages of 32 and 45 constitute the reserves to this army, and form second armies. Then all those over the age of 40 or 45 form the last reserves, whose business it is to stay at home and garrison the depots, make the provisions and supplies, ammunition, etc., for the war armies. They are never called out except in case of invasion.

And yet, under the present conditions of Europe, no sooner does one nation increase her army and navy, than all other nations must do the same unless they would court invasion. The burden is more and more hated by the people. In Germany especially the army makes converts to socialism every day. Young men drafted in the army, and fretting under its control, with time on their hands, are exactly in the position to be ripe for socialistic propaganda. In the growing internationalism of socialism there is, however, developing a strong movement for the abolition of all standing armies. The German socialists do not demand the immediate abolition of the army, because they hold that until the present condition of industry can be changed, to immediately disband the army would throw a large body of men out of the means of support, and would end a valuable field for socialistic propaganda. Some European socialists, however, do agitate for immediate abolition. It is a growing question whether, under the spread of international socialism among the working classes European armies could be counted on in the event of war.

In the United States the part played by United States troops and State militia in recent strikes (see PULLMAN, HOMESTEAD, etc.) has led to a very bitter feeling against the institution of the army among working men and others interested in social reform. Two policies on the subject are entertained by the trade-unions. Some working men urge that no working man should enlist; others advise enlistment, in order

Militarism in the United States.

to obtain military drill, to be used, if necessary, against capitalists, as they hold that capitalists desire to use the army against them. As an illustration of the growing hostility to the extension of the army and the building of great city armories, we give the following quotation from an editorial article in *The Arena* for October, 1894:

"Comparatively few people appreciate the magnitude of the preparations for slaughter which have been steadily pushed since the era of class legislation and special privileges which followed the Civil War.

"That the people may gain some idea of the military activity at the present period, I secured the following interesting and suggestive *data* relative to the Massachusetts armories:

"Armories: The State owns none. Buildings and land: Acts of Legislature of 1888, chap. 384, provides for purchase of suitable land and erection of two armories in Boston, and one in every city in the State in which two or more companies are located.

"Title to land and buildings, 'to be vested absolutely in the city forever.'

"Rent: State to pay no rent to cities after debt contracted in buying land and erecting buildings is all paid.

"Running expenses: State pays janitor, lighting, heating, repairs, and incidentals—all.

"Armories: Boston, three (including the Cadets' new armory); Worcester, one; Lowell, one; Fitchburg, one; Lawrence (in process of erection), one; Lynn (in process of erection), one. Total, eight. Springfield also is preparing to erect an armory which will cost nearly \$100,000, and will make in all nine armories. The Boston Cadets have a large granite armory in process of construction, but it is their private property. Estimated cost, between \$300,000 and \$400,000.

"Headquarters or armories: Besides the armories there are 66 'headquarters,' for which the State pays rent to the cities and towns in which they are located.

"Drill ship: Naval battalion is furnished the ironclad *Passaic* by the United States Government.

DR.

"Expenses: Armories—expense of those provided for by the Act of 1888, chap. 384, \$13,001.98; rent to cities and towns, \$34,758.24. Militia: Pay, transportation, supplies, and expenses of militia, \$163,372.85; expended on State camp ground, \$1798.50; equipment of naval militia, \$3690.07. Total, \$216,621.64.

CR.

"United States: Appropriation, militia, \$27,555.50; naval militia, \$3690.07; sale of condemned military property, \$870.11. Total, \$32,115.68.

"Expense to State for 1892, \$184,505.96.
"Beside this is an expense for keeping records, etc., of militia and naval militia of \$7532.25, making in all \$192,038.21. . . .

"But while a rapidly growing State or national militia is a menace to republican institutions, where wealth is rapidly gaining ascendancy in government and securing seats of power, there is another phase of this question which is still more startling and suggestive. Special attention is invited to the Seventh Regiment armory of New York and the Boston Cadets new private armory in course of erection. . . . The Seventh Regiment of New York, not inappropriately termed the 'rich men's regiment,' is free from debt, and, says the New York *Advertiser*, 'nearly \$1,000,000 have been spent on the building and its furnishings. *The State and the county were not asked for a cent. All this money came direct from the pockets of individuals. Who paid this million-dollar bill?*'

"The general feeling of unrest in the labor and socialistic circles throughout the entire country this spring is only another reason why the National Guard should be given stronger support by both the national and State governments."

The feeling of the labor organizations is evidenced by the resolutions passed by an almost unanimous vote of the Boston Central Labor Union, October 21, 1894, as reported by the Boston *Herald*:

"Adjutant-General Dalton and the militia were denounced, both orally and by resolutions, at yesterday's meeting of the Central Labor Union.

"A letter recently issued by Adjutant-General Dalton was severely criticised at the last meeting of the Central Labor Union, with the result that a committee was appointed to draft suitable resolutions concerning the contents of the letter. The committee yesterday presented the resolutions, which are appended:

"Whereas, Adjutant-General Dalton, in a communication to the commanders of the Massachusetts militia, recently issued, has, by implication and insinuation, seen fit to attack the organizations of labor, thereby creating prejudice in the public mind, with the apparent purpose of magnifying the value of the military arm of the government; therefore be it

"Resolved, that we deplore the evident disposition of those in authority to increase and centralize the numbers of State and Federal troops, and to multiply costly and medieval armories, thereby making more onerous the burden of taxation which, in the ultimate, is borne by the producing classes.

"Resolved, that we believe the maintenance of a large standing army, either as a murder machine, an instrument of intimidation, or for purposes of display, to be unworthy of the age in which we live, a relic of barbarism, and of no utility, excepting to assist those who seek to maintain their special privileges by barbaric methods, and that we therefore call upon all legislators, State or national, who have at heart the in-

terest of labor, to strenuously oppose further appropriations for military increase.

Feeling of Labor Organizations.

"Resolved, that we urge upon working men everywhere the propriety of refraining from participation in military service, and, if already attached, of severing their connection as soon as they lawfully and honorably may.

"Resolved, that we repel, with the utmost indignation, the insinuation of General Dalton, which has since been more openly charged by Generals Schofield and Miles, that the peace of the country is threatened by the attempts of working men to better their condition; but we do affirm that such danger as does exist, arises from the arrogance of corporate power, supplemented by the subservency of those entrusted with public office.

"Resolved, that we demand that the arbitrament of the social problem shall be by those free and peaceful methods provided by the founders of our national institutions, and pledge ourselves to oppose all attempts to establish an armed plutocratic government on the soil of America."

At a mass-meeting in the Cooper Union, New York, July 12, 1894, Mr. Henry George, in referring to our army and the spirit now regnant, said, as reported in the *New York World*, July 13, 1894:

"We have a standing army of 25,000 men, and they are demanding that it shall be increased to 50,000 men. In the days when our government was weaker, yet stronger, when we had a hostile people on our frontier lines, and had real fighting to do, we had an army of only 10,000 men.

"What is the reason that we are building ships of war and increasing the size of our army? It is because the millionaire monopolists are becoming afraid of the armies of poverty-stricken people which their oppressive trusts and machinations are creating."

On the other hand, the report of the Secretary of War for 1894 says:

"It was found necessary during the period beginning with March and extending through July of the current year, in various sections of the country, to employ a considerable part of the army to execute the orders of the United States courts, otherwise successfully defied and resisted, to protect the dispatch of the United States mails, to remove restraints to travel and commerce, and to guard the property of the government. The movement of troops thus necessitated was the largest which has taken place since the close of the Civil War.

"The difficult and extraordinary tasks imposed upon the officers and men of the army were discharged promptly, firmly, and judiciously, in a manner which attested to the courage, intelligence, and loyalty of those called into active duty, and the thorough efficiency of every branch of the service. The militia of the States, wherever employed, also proved generally to be composed of qualified and reliable soldiers.

"I earnestly recommend that Congress enact the legislation necessary to establish in the army the battalion formation, now adopted by the armies of every other civilized nation. As necessary to effect that change, I recommend the removal of the limit of 25,000 men fixed by the act of June 18, 1874, and a return to the limit fixed by the act of July 15, 1870. Legislative approval of these two propositions will restore to the effective force about 4000 enlisted men, bringing the actual strength of the army up to the nominal strength now fixed by law. By these changes the army will be increased in efficiency 20 per cent., in numbers about 16½ per cent., and in cost of maintenance only about 6 per cent."

(SEE ALSO WAR; INTERNATIONAL ARBITRATION; MILITIA.)

ART AND SOCIAL REFORM.—Art (from Latin root *ar*, to fit) meant originally skill in fitting. The artist was simply the skilled workman, and not different from the artisan. He was the man who could make good houses to live in, and particularly good houses in which to enshrine the public's ideals, good temples, baths, theaters, etc. He was one who could make

good furnishings for the houses—good chairs, good vases, good mosaics, good statues and pictures of the gods. Art was thus developed as soon as and to the extent to which the community was lifted above absolute want and the struggle for mere physical existence—*i.e.*, as soon as people had opportunity to think of the quality as well as the quantity of its work. Hence the great art periods of a nation have been either when the nation was rich and prosperous (*e.g.*, the age of Phidias in Athens, the Renaissance in Italy and France, the age of Merry England) or when the people were at least enjoying the fruits of victory or of success in any line (*e.g.*, periods of Gothic art). If, however, a nation becomes wealthy, not by conquest or slow growth, but by producing commodities and selling them, it is evident that the nation will not produce a great art, because it will be compelled to think more of the quantity than the quality of its work; or, if it think of quality, it will think mainly of commodities as fitted to sell. The rich nations of to-day being commercial nations, we need not be surprised to hear artists complaining of the real dearth of art, altho we have in England and America phenomenal wealth. It is evident, from this consideration alone, how social conditions can affect art. We shall in a moment see how art can affect social conditions. For the moment, however, we must notice another point. If art be the production of commodities worthy expressing a nation's aspirations—public buildings, statues and pictures of its gods, its heroes, its ideals of beauty and of power—it will follow that it will attain to high development where *hand-work* is largely practised, since this allows the expression of ideals, and conversely it will attain meager development where machine-work prevails, since this does not allow of much expression of ideals. Here, too, remembering that the present age is characterized by machine production, we see a very potent cause for the present dearth of art.

Once again, when a community becomes divided into two classes, one having leisure and wealth and not producing commodities, the other class poor and doing the productive work, a desire for art will spring up amid the leisure class and not in the other. But since the leisure class does not itself produce, the desire will not create art, but a dilettante, artificial, unnatural desire for art, while the producing class, not having leisure, and being compelled to think mainly how to get a bare existence, will not be able to produce art, especially when the nation's production is mainly carried on by machinery. In such a community the artist will come to be considered very different from the artisan. The artist will usually become an affected idler and the artisan an unartistic "hand." It is only too evident that this is the state of affairs to-day. Such are but some of the ways in which social conditions affect art.

Let us now see some of the ways in which art affects social conditions. Art we have seen to be the producing of good work. Now, when a community thinks a great deal of producing good work—good houses and furnishings for houses, worthy temples, public buildings, baths, etc.—it follows inevitably that the people do not think so much of merely producing commodities

to sell. As a people primarily commercial cannot be primarily artistic, so a people primarily artistic cannot be primarily commercial. It raises a different ideal. The ideal of good work operates in various ways. It produces a demand for leisure in which to do the work.

Commerce vs. Art.

An artistic nation will never live in a hurry. It will seek freedom in which to work. It will not endure great factories and machine-made work. It is a fact that almost all the great artists, and poets, and idealists to-day are among the bitterest foes of the commercialism and mammonism of the present time, and are, for the same reason, among the most earnest workers for social reform. A high and uncommercial social development develops art, and the art demands and calls for social reform, thus producing action and reaction. Thus, great artists like William Morris and critics like John Ruskin are never weary of condemning the shoddy work and commercialism, and baseness and ugliness which characterize so much of modern life. Nor are they ever weary of comparing it, to the damage of the present, with the beautiful work of ages when commerce was not god, and when machines had not crowded people into slums, nor prevented expression entering into the work of the producer. A somewhat less number of artists, poets, and idealists, and especially the greatest among them, are equally ready to work, not for "the good old times," but to bring in the better new times, when machines shall not be abandoned, but when brotherhood shall rule in society, making all classes workers, but giving to all classes immunity from the mere struggle for bare existence. They long for the day when all men shall have time to think of producing good work, using machinery indeed, but using it mainly in producing materials to be worked upon and made beautiful by the free hand expressive of the free creative soul. A few of these artists and poets have been driven, by their hatred of the present and their passion for personal freedom, into anarchistic views (Byron, Shelley, Walt Whitman, and others). But most of them hold that it is industrial competition which enslaves and debases to-day, and that, therefore, freedom lies not in the path of anarchy, but of socialism, and so they have become in increasing numbers earnest socialists.

William Morris, for example, he who had once described himself as "the idle singer of an empty day," declares that he was forced to see that art cannot prosper till we change our commercial competitive civilization; and so he, who is among the greatest of modern artists and poets, is an out-and-out worker for socialism, writing socialist lectures, tracts, and poems, lecturing himself in the open air in London's parks, and serving on socialist committees. He says in the introduction to his *Signs of Change*:

"My ordinary work has forced on me the contrast between times past and the present day, and has made me look with grief and pain on things which many men notice but little, if at all. The repulsion to pessimism, which is, I think, natural to a man busily engaged in the arts, compelled me once to hope that the ugly disgraces of civilization might be got rid of by

the conscious will of intelligent persons; yet as I strove to stir up people to this reform, I found that the causes of the vulgarities of civilization lay deeper than I had thought, and little by little I was driven to the conclusion that all these uglinesses are but the outward expression of the innate moral baseness into which we are forced by our present form of society, and that it is futile to attempt to deal with them from the outside. Whatever I have written or spoken on the platform on these social subjects is the result of the truths of socialism meeting my earlier impulse, and giving it a definite and much more serious aim."

But Mr. Morris is only one of a group of London artists who take the same position, and who to no small degree look upon Morris as their master. Says Mary Bacon Ford, in an article on *The Art Socialists of London* (*Cosmopolitan*, 8, 125):

"Mr. Morris has no more able and earnest a coadjutor than Mr. Walter Crane, the President of the recently formed Arts and Crafts Exhibition Society. His artistic proclivities made themselves known when he was very young, and under the instruction of his father, who was himself an artist, he advanced rapidly in his art work. As a writer Mr. Crane possesses uncommon power. Among his essays, those on *Art and Commercialism* and *Imitation and Expression in Art* are well known, and his poetry is of a fine flavor. As a lecturer he is contained, interesting, and to the point. Founder and President of the Arts and Crafts Exhibition Society, he was a representative to the last Liverpool Art Congress, and is an active member of the Socialist League, to which he gives freely of his strength.

"Around Mr. Morris and Mr. Crane are a group of notable men, distinctly representing the progress of the English art industries, and supporters of many, if not of all, of their theories.

"Mr. E. Burne-Jones, the well-known painter, is the designer of nearly all the stained-glass and mosaic work that is made in the Morris factory. Mr. William de Morgan is a potter, and sends forth from his workshop, also at Merton, the exquisite pottery and tiles that can be seen in his shop on Argyll Place, and that surpassed at the Arts and Crafts Exhibition last autumn all other work in this direction.

"Mr. T. J. Cobden-Sanderson is a bookbinder, and lives at Hendon, near London. Mr. Sanderson's books are of course wholly worked and tooled by hand, and represent perfect manipulation combined with a keen artistic vision. He claims that modern bookbinding in essentials has remained unchanged to the present day, tho in those outward characteristics which appeal to the touch and to the eye, and constitute binding in an artistic sense, it has gone through many changes for better or for worse, which have resulted in the main in the exaggeration of technical skill and in the death of artistic fancy. He further has written that, in his opinion, the work as a craft of beauty suffers, as do the workmen, from the allocation of different operations to different workmen.

"Messrs. T. M. Stradwick, Lewis F. Day, Somers Clark, W. A. S. Benson, G. T. Robinson, Emery Walker, Metford Warner, Stephen Webb, J. D. Sedding, Haywood Sumner, J. Hungerford Pollen, Spencer Stanhope, and other well-known men, who, as painters, architects, printers and workers in glass, metal, clay, and wood, deserve mention for their aims and achievements.

"On all sides the movement has given rise to guilds, societies, schools, exhibitions, publications, and lectures, all tending in the same direction, and all more or less at one in a feeling of fellowship and cooperation.

"Allied to it, not as craftsmen, but as supporters and general promoters, are or have recently been such men as Ruskin, Browning, John Morley, James Linton, Philip Magus, Mr. Horsfall, Mr. Cust, G. F. Watts, Mr. King, Ernest Radford, called the 'Young Tribune,' and W. B. Richmond, the ardent advocate of the Sunday Opening movement—all of whose names figure as officers or members in the following efforts toward labor emancipation.

"Toynbee Hall, in the east end of London, supports a School and Guild of Handicraft, and conducts admirable lecture courses, in which Mr. Morris, Mr. Richmond, Mr. Day, Mr. Radford, and others take part. Loan exhibitions of pictures and prints are also held in its schoolhouse, always in conjunction with printing-presses and other vehicles for practically illustrating the manufacture of some of the objects on view.

"The Red Cross Hall and Garden, in the south of London, is a somewhat similar institution, and it is here that Mr. Watts' idea of erecting memorials to every-day heroes and heroines is about to be carried out. Nine large panels have been planned for mural decoration, and Mr. Crane has generously offered to undertake them, the subjects to be illustrative of the heroic deeds of contemporaries and, as far as possible, of the inhabitants of that very neighborhood and in the same walk of life as those for whose use the hall is designed. Mr. Crane, who enters upon this work without compensation, has already designed a panel representing the woman Alice Ayres in the act of rescuing two children from a fire, and speaks of the plan with great interest and enthusiasm.

"The Art for Schools Association, of which Mr. Ruskin is President, and which counts among its members Mr. Morris, Mr. Wattle and Mr. Morley, was established in 1883, to circulate among schools photographs and copies of works of art; the Home Arts and Industry Associations, also of recent foundation, conducts classes of art handiwork among the people of remote sections of the country, to prepare them for entrance into trades, while also increasing their resources and enjoyment; and a section of applied art was established in The Society of Arts in 1887, in whose interest Mr. Crane has delivered lectures—notably upon book illustration.

"Another phase of the movement is seen in the formation of the Century Guild, a guild of architects, decorators, printers, and art manufactures of all kinds, a sort of community formed for the production of useful and beautiful things, good workmanship, and for mutual help and advantage. This Century Guild has an organ of its own, a quarterly called *The Hobby-Horse*, which is printed by the Chiswick Press, and is probably the purest current specimen of fine printing."

Outside of England there is no movement of the artists that at all compares with this, but in France, Germany, Italy, and the United States the feeling is growing in this direction.

Poets and musicians and authors take the same position. We need here only refer to the names of Dickens, Victor Hugo, Zola, Ibsen, Howells, Stedman, and Walt Whitman. There are many others. The subject of Richard Wagner's great trilogy, the "Niebelungen Ring," is the curse of gold. (Concerning Ruskin and his *Political Economy of Art*, see RUSKIN.) One other point only is it necessary to make, the opposition of art to those who consider Puritanism a part of social reform. This opposition is usually expressed in some such words as these:

"That the beauty of life is a thing of no moment few people would venture to assert. Beauty, which is what is meant by art, using the word in its widest sense, and the craving for it are no mere accidents of human life, but have been bound up by the closest ties with the whole history of the race from the time of the crudest carved ivories of the paleolithic cavew-dweller to the sculptures of Phidias and the paintings of Raphael. Toward an element of human character so persistent and universal we are, therefore, compelled perforce to adopt one or the other of two attitudes, regarding it either as a vice to be suppressed or as a virtue to be cultivated.

Now the religious temper of the most progressive countries of the world since the middle of the sixteenth century and the industrial conditions of the last century and a quarter have led to a very general triumph, in greater or less degree, of what may best be called the Puritan spirit, of which, as far as art is concerned, the first, the essential characteristic, is its attitude toward the human body and toward all that life of the senses, which is so large a part of the heritage of beings who have not only spirits and minds, but bodies, too. The Puritan, when he is logically true to himself, regards the body, to use his own expression, as a vile body; he has a contempt for it; he has a perpetual suspicion of it, as something to which he is unfortunately tied in this world, but from which he must seek to disengage himself as far as possible. As an obvious consequence of this fundamental view the life of the senses, the delights which come to us from sight or taste or touch, are to him things to be regarded as mere temptation,

as baits to seduce us. Thus, to again quote his own language, the theater is to him, in its very nature, but the gate or 'anteroom of hell,' and dancing but 'an ungodly shaking of the limbs.' All art of any kind thought of as an end in itself is, therefore, *anathema maranatha*, because all sensuous indulgence is sin; or since certain arts are almost indispensable to human existence, they are to be allowed no further than as they may, so to speak, be turned against themselves and made to allure us from this present and visible world to that which is invisible and to come. It is not necessary to inquire here what truth there may be at the bottom of this view of life, tho a truth there certainly is, however ludicrously and pitifully burlesqued. It is sufficient to point out that such a temper of mind has brought about an arrest of the creative arts in every nation exactly in proportion as it has become dominant. What the absence of art may betoken in the long run it is not easy for us to say, since that lack belongs only to these later times of the world's history, of which we cannot yet form any fair estimate, because they are too near to us; but clearly in the present it indicates a transference of the interest of civilized men from the development of the human and intellectual energies of the race to the development of its mechanical energies, and it may be further said that if this tendency is to go on along the logical road of development it must destroy the arts of design and all that is analogous to them in literature."

From such reasoning as this it is easy to see with what vehemence almost all artists oppose even the beginnings of Puritanism in society. They declare that it is even atheistic in failing to recognize God as the Creator of matter as truly as the Creator of the spiritual life. They consider it immoral as tending to a gross conception of the body. Undoubtedly this position may be and has been caricatured and diverted from its proper use to serve the cause of license rather than of beauty. We are concerned here only to point out what is the bearing of art upon social reform. We close our article with one more quotation from William Morris's *Signs of Change* (chapter, "The Aims of Art"). He says:

"It is clear to me that, at the present time, those who look widest at things and deepest into them are quite dissatisfied with the present state of the arts, as they are also with the present condition of society. This I say in the teeth of the supposed revivification of art which has taken place of late years; in fact, that very excitement about the arts among a part of the cultivated people of to-day does but show on how firm a basis the dissatisfaction above mentioned rests. Forty years ago there was much less talk about art, much less practise of it, than there is now; and that is specially true of the architectural arts, which I shall mostly have to speak about now. People have consciously striven to raise the dead in art since that time, and with some superficial success. Nevertheless, in spite of this conscious effort, I must tell you that England, to a person who can feel and understand beauty, was a less grievous place to live in then than it is now; and we who feel what art means know well, tho we do not often dare to say so, that forty years hence it will be a more grievous place to us than it is now if we still follow up the road we are going. . . . Art then is gone, and can no more be 'restored' on its old lines than a medieval building can be. The rich and refined cannot have it tho they would, and tho we will believe many of them would. And why? Because those who could give it to the rich are not allowed by the rich to do so. In one word, slavery lies between us and art."

ARTHUR, PETER M.—Head of the Brotherhood of Locomotive Engineers in the United States; born in Scotland, 1836; came to America when 10 years old, lived on a farm with his uncle in Schenectady, N. Y. When 18 years old he was employed as wiper in the engine-house at Schenectady; became fireman, and then engineer. He was early interested in the organization of his craft, and in 1874 was chosen to its highest office, since when he has been annually reelected. The Brotherhood has, under him, become one of the most powerful altho most conservative trade-unions in the country, numbering some 30,000 men. His residence and the headquarters of the Brotherhood are at Cleveland, O. His policy of using all conciliatory means before appealing to strikes, which, under his lead, have been very few, has given him a strong hold on the confidence of both his order and the public. (See **BROTHERHOOD OF LOCOMOTIVE ENGINEERS**.) He has, however, been much criticised by many in the labor movement for not being more willing to combine with other labor organizations. His conception of his position is that he is the head of a business corporation formed to subservise the interests of its members alone, and that, however he or anybody else may feel personally, as head of that organization he must limit his interests to that.

ARTISAN, one skilled in any art, mystery, or trade; a handicraftsman, a mechanic. We distinguish to-day between the art and artisan, but the artist should probably be an artisan and the artisan an artist. William Morris, for example, believes that "art is built up from handicraft," and the decay of art means to him the decay of the power of the average man to make something beautiful with his own hands, not as an isolated event to be talked about for years, but as an every-day occurrence, part of the normal expression of his daily life. When Morris, therefore, sings the dirge of art, it is popular art that he thinks dead or dying. He admits as fully as any one the excellence in technic displayed by many English painters, the admirable drawing, the coloring, and so forth. He laments rather the passing away of the artist workman, of the man so trained, so envired, that he could both design and produce objects of beauty.

It was such men as these who built and beautified many of the great cathedrals and churches of Europe; who sculptured the portals of Chartres and the glorious façade of Amiens, and who have left in a thousand European cities and towns moldings and traceries and foliated capitals, portraits and quaint fancies, quips and jests, as well as dreams of beauty in wood, metal, stone and marble, to be the wonder and admiration of our time. According to Morris, this beautiful work was the result of really free associated human labor, where the worker was his own master, had received a careful training in apprenticeship to his guild, and worked in fraternal equality with others. To-day the aver-

age worker is a machine-minder, the all but soulless agent of an anonymous joint-stock company or syndicate; performing day after day and year after year the same piece of monotonous mechanical drudgery; liable any day to be elbowed out of the field by new inventions, unable to work unless a body of capitalists can make for themselves a profit out of his work, and living amid noisome, sordid, and hideous surroundings. (See **ART**.)

ASHLEY, LORD. See **SHAFTESBURY, EARL OF**.

ASHLEY, WILLIAM JAMES, born in London, 1860; A.B. at Balliol, Oxford, 1881; M.A. 1885; 1885-88 Fellow of Lincoln and Lecturer in Modern History in Lincoln and Corpus Christi colleges; 1888-92 Professor of Political Economy and Constitutional History in the University of Toronto; 1892 Professor of Economic History in Harvard University, Cambridge, Mass. He is a strong adherent of the historical school in economics, believing that political economy has yet reached few generally accepted conclusions, and cannot reach them until it slowly builds up a body of doctrine based on carefully investigated facts. He believes, with Professor Sidgwick, that there are good *theoretic* reasons in favor of protection, but that the practical difficulties are so great that in *democratic* communities free trade is less dangerous. Bimetallism for a single nation he believes the height of folly. Between international bimetallism and monometallism he delays making a choice, but has the impression that currency questions are of much less importance than the disputants on either side appear to think. He believes in the nationalization and municipalization of natural monopolies only when the state of political morality and the organization of the civil service make it tolerably safe, which he thinks is not likely to be for some time to come. In this class, however, he does not include land, except under very exceptional circumstances. His main works are: *An Introduction to English Economic History and Theory*, part i. (published in the United States as vol. i.), *The Middle Ages*, 1888 (now in third edition), part ii. (published in the United States as vol. ii.); *The End of the Middle Ages*, 1893 (now in second edition; German translation in the press). Some minor writings: *James and Philip van Artevelde*, 1883 (Lothian prize essay); *What is Political Science?* 1888 (inaugural lecture before the University of Toronto); *The English Manor*, an introductory chapter prefixed to the English translation of Fustel de Coulanges' *Origin of Property in Land* (1891); *On the Study of Economic History*, an introductory lecture before Harvard University, in *The Quarterly Journal of Economics*, January, 1892 (translated in Munich, *Allgemeine Zeitung*); various articles in various quarterlies, journals, etc. Professor Ashley is now (1895) editing Macmillan's series of Economic Classics.

ASSESSMENTS, POLITICAL.—A general term used to designate the pecuniary contributions levied by Congressional, State, and municipal political committees upon the office-

holders or candidates belonging to their several parties, for the stated purpose of defraying the expenses of the political canvass conducted by them. With office-holders it usually takes the form of a request for a specific sum, amounting to a certain percentage of their salaries. The assessment of candidates is not so systematized, unless it be in New York City. An action has been brought in New York against a judge to recover a portion of the assessment levied upon him as a candidate; and it is a matter of common belief that in 1880 a judicial candidate mortgaged his prospective salary to secure the payment of an assessment of \$17,000. The practice is, of course, an outgrowth of the spoils system. (See CIVIL SERVICE REFORM.)

The first specific instance of an assessment of this kind is found in the Swartwout investigation in the twenty-fifth Congress, when a former deputy-collector of New York testified as follows: "I have frequently been called to contribute to political objects while I was deputy-collector, as an officer of the custom-house." The amount was from \$20 to \$100. The tax was *pro rata*, from 1 to 6 per cent. of the salary. It was assessed by a general committee of the Tammany Hall party. If the individual declined to pay, he was reported. From that time at least the process has gone on. The existing system may be described by a statement of what was done in 1880. The Republican Congressional Committee is said to have addressed all persons (except the heads of executive offices) drawing salary from the national Government a letter containing these words: "Under the circumstances in which the country finds itself placed, the committee believes that you will find it both a privilege and a pleasure to make a contribution, which, it is hoped, may not be less than ———. The committee is authorized to state that such voluntary contribution will not be objected to in any official quarter." The blank was filled by writing in a sum equal to two per cent. of the salary of the person addressed. On October 14 the same persons were asked "to promptly contribute to its funds an additional one per cent." There is high authority for stating that at least \$100,000 was thus raised. The assessment varied in different States, being highest in Pennsylvania and New York. In New York three per cent. of a weekly stipend of \$2 was requested from a boy in a rural post-office. In New York City firemen and even school-teachers were assessed. The assessment of candidates in that city is supposed to be—for a judgeship, \$15,000; district attorneyship, the same; for a nomination to Congress, about \$4000; for coroner, \$2000; alderman, \$1500; assemblyman, from \$600 to \$1500. The annual amount thus raised by Tammany may be put at \$125,000. Mr. John Kelly in 1880 defended the large salaries paid to the city aldermen on the ground that it was necessary to enable them to meet the large political demands made upon them. President Hayes made an executive order forbidding these assessments, and bills have been passed forbidding them, but it has not availed. The only cure is probably through a rigid civil service. (See CIVIL SERVICE.) We are indebted for these facts to Frederick W. Whitridge, whose article on this subject in

Lalor's Cyclopaedia we have here abridged. (For the methods and growth of reform upon this subject, see CIVIL SERVICE REFORM; also DIRECT LEGISLATION.)

ASSIGNATS (from Lat. *assignatus*, pp. of assignare, to assign or allot), notes forming the paper currency issued in France during the Revolution, from 1789-96. They were based on the security of the confiscated church lands, and afterward of all the national domains and other property. Issued to the amount of 45,000,000,000 frs., before they were withdrawn they deteriorated to less than one three hundredth of their face value. They are usually used as an instance of the folly of adopting a paper currency irredeemable in gold; but the believers in paper currency answer that the trouble lay not in the assignats, but in the security they represented; that people had small faith in the revolutionary government or its validity of title to the confiscated land, and that, therefore, it is small wonder that the assignats, based on such security, depreciated. To attempt to reason from the France of the Revolution to the United States of to-day, they argue, shows the feebleness of the argument.

The name *assignats* was given by the National Assembly because they represented lands *assigned* to their holders. They consisted chiefly of notes for 100 frs. (\$20), tho many of them were for as small amounts as 10 or even 5 frs. The first issue was for 400,000,000 frs., and bore interest, which the others did not. The amount in all issues reached the enormous sum of 45,578,000,000 frs. They were, besides, so poorly printed that they were easily counterfeited abroad. It was, therefore, small wonder that they began to depreciate, and by June, 1793, 1 fr. in silver was worth 3 in paper; and by August, 6 in paper. The State undertook to enforce their circulation, but only brought them back upon its own hands. By March, 1796, 1 louis d'or (24 frs.) brought 7200 paper francs. In 1796 they were withdrawn and redeemed at one thirtieth of their value by *mandats*—a new paper money which enabled the holder to take immediate possession of the land (the assignats could only be sold). The *mandats* soon also depreciated to one seventh of their face value, and were redeemed by being accepted by the government in payment of taxes or for land.

ASSOCIATED CHARITIES. See CHARITY ORGANIZATION.

ASSOCIATION FOR THE PROMOTION OF PROFIT-SHARING, THE.—This association was organized January, 1892. It had been decided at the preliminary meeting to be undesirable to follow the strict lines of the French society by admitting to membership only business men actually practising profit-sharing. It was thought to be more desirable to unite all who advocate the system, whether practising it or not. Membership in the society is thus open not only to men of affairs, but to professors and students of political economy, journalists, clergymen, and teachers—to all, in fact, who believe in the system and desire to see it extended. The American society does

not intend, however, to be characterized by a less practical spirit than that of the French association. It desires, in the first place, to be useful in furnishing information about profit-sharing in the past and present to any firm or corporation that is thinking of introducing any of the methods mentioned in its constitution. It will arrange for addresses on the general subject before commercial clubs and other organizations in leading cities, from time to time.

For further information address its Secretary and Treasurer (1895), Rev. N. P. Gilman, Boston, Mass. (See PROFIT-SHARING.)

ASYLUMS, FOR THE BLIND, INSANE, etc. See BLIND ASYLUMS, INSANE ASYLUMS, etc.

ATELIERS NATIONAUX (national workshops), a term used in France for the workshops established by the Provisional Government of France in the Revolution of 1848, to give work to the unemployed.

The Provisional Government had scarcely been established (in February, 1848), when a committee of socialists demanded of it the recognition of the right to work. Louis Blanc and one or two others were the only real socialists in the government, and the demand of the men was, therefore, refused, and only when strenuously insisted upon was it reluctantly conceded, for political reasons. And it is doubtful if the government really ever intended to make the shop a success. Louis Blanc says distinctly that the government only nominally yielded, but appointed a committee secretly instructed to make the shop fail. In any case, the state of Paris at the time, the acuteness of the industrial and political crisis, the supposed necessity of doing something at once on a large scale for political, no less than economic reasons, and the jealousies and intrigues of opposing parties both within and outside the Provisional Government were all factors in the situation which tended to make difficult, if not impossible, the execution of any carefully planned scheme. The most cursory examination of the evidence shows that it is impossible to judge correctly of the *ateliers nationaux* on the supposition that they were merely a *bona fide* effort to carry out the decree establishing the "right to work."

However this may be, on February 25 the Provisional Government passed a decree from which the following is an extract :

"The Provisional Government of the French Republic undertakes to guarantee the existence of the workmen by work. It undertakes to guarantee work for every citizen."

For the purpose of carrying out this decree, Louis Blanc advocated the formation of a Ministry of Labor, but this was negatived on the ground that a mere provisional government could not thus anticipate the decision of the future assembly. In place of it, as a compromise, a Government Labor Commission, under the presidency of Louis Blanc, was established by a decree of February 28, with power of inquiry and consultation only. The Commission met at the Luxembourg. Meanwhile, the carrying out of the decree of February 25, by the establish-

ment of national workshops, was confided not to this Commission, but to the Minister of Public Works, M. Marie, by the following decree of February 26 :

"The Provisional Government decrees the immediate establishment of national workshops. The Minister of Public Works is intrusted with the execution of the present decree."

This was followed the next day by a decree specifying various public works to be started.

At the same time the immediate resumption of work on government buildings, etc., was decreed. Besides the works organized by the Minister of Public Works, the Minister of War opened works in the Champs de Mars. From this time the responsibility for the national works as actually organized rested primarily with M. Marie, the Minister of Public Works, while Louis Blanc and the Commission at the Luxembourg organized cooperative societies of tailors, and other trades, to which the State gave certain contracts to execute. The history of these societies has an interest of its own, but they were entirely separate from the national works organized by the State.

All went well while the number of the unemployed was less than 6000, but as soon as that number was exceeded the workmen of each *arrondissement*, after having visited all the open works in succession without result, returned to their *mairie's* offices tired, starving, and discontented.

Louis Blanc soon resigned, and publicly denounced the scheme as not being conducted in good faith. The workmen had been promised bread when work was not to be had. The great mistake was, however, then committed of giving them money, and distributing it in public at the offices of the *maires* instead of distributing assistance in kind.

Each *mairie's* office was authorized to pay every unemployed workman 1.50 frs. per day on production of a ticket showing that there was no vacancy for him in the national works.

The fixed sum of 2 frs. was paid to any workman engaged on the public excavation works, without regard to his age, the work done, or his calling. The workman made the following simple calculation, and he made it aloud : "The State gives me 30 sous for doing nothing ; it pays me 40 sous when I work, so I need only work to the extent of 10 sous." This was logical.

The works opened by the Minister of Public Works being far distant from each other, and the workmen not being able to visit them all in turn to make certain that there were no vacancies for them, two central bureaux were established, one at the Halle-aux-Veaux, under M. Wissocq ; the other near the *mairie's* office in the fifth *arrondissement* in the Rue de Bondy, intrusted to M. Higonnet. The workmen went to have their tickets examined at one of these bureaux ; and the absence of employment having been proved, they returned to get their 30 sous at their *maires'* offices.

As the numbers claiming work or relief rapidly increased the whole organization got rapidly

Louis Blanc
denounces
the Scheme.

out of hand, and both the bureaus and the *maires'* offices became the centers of tumultuous crowds, which those in charge were quite unable to satisfy or keep in order. On March 5, therefore, Émile Thomas, a chemist connected with the *Ecole Centrale*, was commissioned by M. Marie to reorganize the works on a semi-military plan, in which he was aided by some of the senior pupils of the *Ecole Centrale*.

The workmen were divided into companies, each of which, when the organization was fully developed, contained 900 men. Each company was divided into four lieutenantancies, each containing 224 men and a lieutenant, and each lieutenantancy into four brigades, each with 55 men and a brigadier. Finally each brigade was divided into five squads with 10 men and a chief of squad, all belonging to the same *arrondissement*. The brigadiers and chiefs of squads were elected by the men whom they had to control. This complicated organization was not fully developed during the first month.

On March 6, when Émile Thomas took the work in hand, the number of unemployed in Paris was estimated at from 13,000 to 14,000, in addition to 4000 or 5000 already engaged on public works. This number continued steadily to increase day by day, without, however, any corresponding expansion of the public works. The engineer officers were directed by the government to suggest plans for new works, but they appeared unable or unwilling to do so, and day after day slipped by, the director having to exercise all his ingenuity to provide some means of occupying the idle masses of men who had been enrolled, and who were drawing 30 sous a day from the State.

On March 15, after a meeting of the chief engineers, who were still unable to suggest means of employing usefully more than a few hundred of the 14,000 unemployed men, it was resolved to undertake a series of works in the plain of Monceaux, which, if serving no other object, would at least have the advantage of keeping the crowd employed. Already the whole scheme was costing 20,000 frs. a day, and measures were contemplated for reducing and finally extinguishing the pay to the idle. The following is an extract from an order of the day dated March 16:

"From to-morrow, Friday, the 17th inst., the daily pay of workmen who are not working will be reduced to 1 fr. instead of 1½ frs. The director can guarantee to workmen that from this day forward they will be employed at least every other day; in this case their pay will be 2 frs."

Already political feeling between the moderate and the extreme sections of the Provisional Government was running high in view of the elections which were fixed for April. The strength of the "moderate" party centered in the Hôtel de Ville, that of the socialists in the Luxembourg. From the middle of March onward the national works depended politically on the Hôtel de Ville, and were more and more utilized to counteract the influence of the Luxembourg, and to secure the return of the Hôtel de Ville "list" of candidates at the elections. Hence from this time it becomes progressively more difficult to treat the works as a purely economic experiment.

Private industry was practically at a standstill and workshops were closing every day: some for want of capital, others through strikes of their workmen, who had recourse to the national works if their demands were not granted.

Causes of Failure.

The Minister of Public Works vainly issued on March 20 a proclamation urging the workmen to return to their workshops, and pointing out that large workshops had been closed or were threatened with closing owing to the crisis. At this time 12,000 men were actually employed at the national works, and the number of men enrolled was increasing very rapidly.

That the administration of the works was on an altogether unnecessary scale is not denied even by the director, who, however, declared that he was continually under the necessity of finding places for crowds of applicants sent to him with recommendations which he could not resist. Thus a large number of actors, painters, commercial clerks, and others, thrown out of work by the crisis, having been refused tickets for admission to the works as not wearing the workman's blouse, were employed by the director as pay agents. Notwithstanding this army of officials, it is stated that "no serious control was exercised over these crowds of humanity. Many of the workmen had themselves enrolled in several brigades, so as to draw wages from each; others came solely for the purpose of drawing wages, tho they worked as usual in private workshops. Brigadiers exaggerated the number of men in their brigades, in order to appropriate the excess wages which they were supposed to distribute. Workmen who had a disagreement with their employers combined, deserted their own workshops, and went to the national workshops. This was done by the paper-stainers and the hatters."

Toward the middle of April the numbers enrolled again far outran the number for whom work of any kind could be provided. The director, left to his own resources, organized a few special workshops to employ certain classes of workmen at their own trades. Thus a number of wheelwrights and joiners were employed to mend the tools which were constantly being broken by the inexperienced workmen. Workshops of shoemakers and tailors were also established, from which the more needy and ill-clad of the workmen could be supplied with cheap clothes and boots. It was, however, impossible to persuade the shoemakers to accept this arrangement, by which they were compelled actually to work instead of loafing, except by the threat of the alternative of expulsion from the national works. After a time the system, in these special workshops, was changed from time-work to piece-work, but not in most cases without great opposition from the workmen.

The National Assembly, elected by universal suffrage, met on May 4. A few days later the Executive Commission was elected, containing all the members of the Provisional Government except Louis Blanc and Albert, the socialist representatives. On May 10 Louis Blanc renewed his motion for a Minister of Labor, which was rejected. On the 15th the Assembly was invaded by the mob, and from that time the

anti-socialist tendency of the government became more marked. The new government immediately determined to reduce and suppress the national works, which were draining the treasury and demoralizing the people, and which were suspected of being centers of intrigue on the part of Louis Bonaparte.

On May 15 M. Marie was transferred to another post in the Provisional Government, and was succeeded by M. Trélat, who at once set about the task of reduction. A commission, including a number of engineers and other practical men, was appointed to inquire into the condition of the national works and to devise measures for reducing their cost "without prejudice to the sacred principle of the *guarantee of work*," and to superintend the carrying out of these measures. M. Lalanne, an engineer of bridges and roads, acted as secretary. The first measure ordered was a complete census of the workmen in the national works. On May 26 the director, Émile Thomas, was compelled to resign, and was sent, practically under arrest, to Bordeaux on the pretext of a commission to study the prolongation of a canal. He was succeeded as director by M. Lalanne.

On May 30 the National Assembly decreed the substitution of piece-work for day-work, but the change was difficult to carry out, and the

results were unsatisfactory. On June 15 the Assembly determined on the suppression of the works; and to guard against the consequences an army under General Cavaignac was concentrated on Paris. On June 22 the proposals for the enlistment of workmen between 18 and 25, and the other measures of reduction detailed in M. Trélat's letter to Émile Thomas of May 24, appeared in the *Moniteur*, and the same day an attempt was made to organize the first batch of departures from Paris. The result was the bloody insurrection of June 23 and following days, which, thanks to the military organization of the national works, was only suppressed after three days of street fighting. In the course of the insurrection the Executive Commission resigned, and General Cavaignac became dictator.

Soon after this Louis Napoleon was elected President of the Republic. The gigantic schemes subsequently carried out under the Second Empire for the rebuilding of large parts of Paris served for many years to provide employment for Paris workmen, and while they lasted formed an effective substitute for the ill-fated national works.

A full account of the matter can be found in the *Blue Book on the Unemployed*, published by the English Labor Department in 1893. Our account has been abridged from this.

The chief authorities are: *Histoire des Ateliers Nationaux*, Émile Thomas (1848); *Histoire de la Révolution Française*, Louis Blanc; *Histoire de la Révolution de 1848*, Lamartine; *Le Placement des Employés (Office du Travail)*, 1892.

ATHENS, SOCIAL POLITY OF.—The capital of ancient Attica and of modern Greece we here consider simply from a sociological point of view. Yet even from this standpoint it affords far more interest and interest than

has been generally recognized. Greek sociology centered around the State (see GREEK SOCIAL POLITY), and they usually meant by the State the municipality, or city; hence, *political* economy, the economy of the *πολις*, or city. Of this social conception Athens is, perhaps, the best and greatest example. In the first place, it was, *with the exception of its slave basis*—of which we shall speak later—well-nigh perfectly democratic. Even during the kingly or traditional period there seems to have been recognition of the popular power in the brotherhoods (*φρατρία*) and clans (*γένη*), believed to rest, and probably actually resting, on consanguinity. This largely disappeared under the Eupatrids, but was more than revived by Solon. He established the *εκκλησία*, or assemblies of the whole people, to elect the archons and councillors; to judge the former at the annual expiration of their office; and to accept or reject all the laws and decrees proposed by the council. (THE REFERENDUM, *q.v.*) Under Clisthenes all free inhabitants of Attica were admitted to citizenship, making Athens and Attica (except for its slave basis) absolutely democratic.

This, however, is the least interesting of Athens' sociological features. It is of far greater interest to see how far-reaching and highly developed was its municipalism. Here, as in all Greek life, the individual was conceived as in a sense subordinate to the State, and yet in such a way as not to quench, but to increase his true individuality. What city can show greater individuals than Athens? The individual was an organic part of an organic whole. The State was omnipresent. It conducted and maintained the religious rites of the city, the Panathenaic and other festivals. It built and cared for the temples, baths, gymnasias, stoa, theaters, market-places, etc. It maintained and conducted these. It cared for the arts. The Parthenon and the Acropolis were the creation of State artists. The State entered into trade. It owned and operated mines in Thrace and Attica. The silver ore of the Laurium mines constituted the first Attic treasury. The revenues of the State were mainly derived not from citizen-paid taxes, but from woods, pasture, lands, houses, and mines, all owned and operated by the State. The State largely watched over and guided the colonial system, which was almost the ruling feature of Athenian financial life. The State built the wharves and warehouses of the Peiræus; it controlled the weights and measures; it examined balances and minted coin. It entered into distribution; providing food at cheap price in time of want; it regulated the price of corn; it saw to it that none of its citizens came to distress. At frequent festivals it distributed provisions gratuitously—bread, and oxen, and fruit. At the theater largesses were made. In the army, the officers at first were not paid, it being considered honor enough thus to serve the State; but the common people were paid. When the city was in funds, division was made among all—not in charity, but as a dividend of the municipal corporation to which they belonged. So far did Athens carry its municipalism. The city succumbed finally, because it was *not* a true socialism; it was free for its citizens,

Municipalism.

but its freedom rested upon slavery. Nor was it federated into a true nationalism. Greece was divided into rival communes and republics, and fell before a centralized power like Rome. (Consult any *History of Greece*.)

The number of slaves in Greece, or even at Athens, can scarcely be determined with any tolerable approach to certainty. It is stated by Athenæus (vi. 20), on the authority of Ctesicles, that the census of Demetrius Phalereus gave for Athens 21,000 citizens, 10,000 metics (resident foreigners), and 400,000 slaves. It is also stated by the same author that Corinth had possessed 460,000 slaves and Ægina 470,000. Hume, in his essay, *On the Populousness of Ancient Nations*, maintained that the assertion of Athenæus respecting Athens is quite incredible—that the number of Athenian slaves “is at least augmented by a whole cipher, and ought not to be regarded as more than 40,000.” Boeckh and Letronne have since made the question the subject of fresh studies. The former has fixed the number of Attic slaves at about 365,000, the latter at 100,000 or 120,000. M. Wallon has revised the labors of these scholars, and adduced further considerations of his own. He estimates the number of slaves employed in all Attica in domestic service at 40,000; in agriculture at 35,000; in the mines at 10,000; in manufactures and commerce at 90,000. To these must be added, for old people and children under 12 years of age, 6000 and 20,000 respectively, and also the public slaves, of whom, as we have said, 1200 were Scythian archers. He thus arrives at the conclusion that the servile population of Attica was comprised between the limits of 188,000 and 203,000 souls, the free population being about 67,000, and the metics amounting to 40,000. The slaves thus bore to the free native population the ratio of 3 to 1.

Professor Ingram, writing in the *Encyclopædia Britannica*, in the article on *Slavery*, says:

“The condition of slaves at Athens was not in general a wretched one. Demosthenes (*In Mid.*, p. 530) says that, if the barbarians from whom the slaves were bought were informed of the mild treatment they received, they would entertain a great esteem for the Athenians. Plautus in more than one place thinks it necessary to explain to the spectators of his plays that slaves at Athens enjoyed such privileges, and even license, as must be surprising to a Roman audience. The slave was introduced with certain customary rites into his position in the family; he was in practice, though not by law, permitted to accumulate a private fund of his own; his marriage was also recognized by custom; tho in general excluded from sacred ceremonies and public sacrifices, slaves were admissible to religious associations of a private kind; there were some popular festivals in which they were allowed to participate; they had even special ones for themselves both at Athens and in other Greek centers. Their remains were deposited in the family tomb of their master, who sometimes erected monuments in testimony of his affection and regret.”

Thus Athens may be looked at from the standpoint of social science in at least two opposite ways. Looking at its free population, it may be considered a socialistic city, and the socialists may use it as an illustration of great individualities produced, not by competition, but by socialism. Looking at its large slave population and despite put upon manual labor, Athens may be considered as an oligarchy, intellectual, brilliant, but resting on injustice and immorality.

ATKINSON, EDWARD, economist, born in Brookline, Mass., February 10, 1827. He was educated principally at private schools. His reputation has been made by the numerous pamphlets and papers that he has contributed to current literature on economic topics. The subjects treated embrace such general topics as banking, competition, cotton, free trade, mechanical arts, and protection. The most important of his addresses are *Banking*, delivered at Saratoga in 1880 before the American Bankers' Association; *Insufficiency of Economic Legislation*, delivered before the American Social Science Association; *What Makes the Rate of Wages?* before the British Association for the Advancement of Science; address to the chiefs of the Bureau of Labor Statistics, at their convention in Boston in 1885; vice-presidential address on *The Application of Science to the Production and Consumption of Food*, before the American Association for the Advancement of Science, in 1885; and *Prevention of Loss by Fire*, before the millers of the West in 1885. His pamphlets and books include the following: *Cheap Cotton by Free Labor* (Boston, 1861); *The Collection of Revenue* (1866); *Argument for the Conditional Reform of the Legal Tender Act* (1874); *Our National Domain* (1879); *Labor and Capital—Allies, not Enemies* (New York, 1880); *The Fire Engineer, the Architect, and the Underwriter* (Boston, 1880); *The Railroads of the United States* (1880); *Cotton Manufactures of the United States* (1880); *Addresses at Atlanta, Ga., on the International Exposition* (New York, 1881); *What is a Bank?* (1881); *Right Methods of Preventing Fires in Mills* (Boston, 1881); *The Railway and the Farmer* (New York, 1881); *The Influence of Boston Capital upon Manufactures*, in *Memorial History of Boston* (Boston, 1882), and *The Distribution of Products* (New York, 1885). In 1886 he began the preparation of a series of monographs on economic questions, for periodical publication. Through his efforts was established the Boston Manufacturers' Mutual Fire Insurance Company, an association consisting of a number of manufacturers who, for their mutual protection, adopted rules and regulations for the economical and judicious management of their plants. He has invented an improved cooking-stove called the “Aladdin cooker.”

AUSTIN, JOHN, a distinguished writer on jurisprudence, was born March 3, 1790. At the age of 16 he entered the army and served as a subaltern with his regiment in Sicily; but he left the service when peace was declared, and in 1818 commenced practice at the bar. Through the influence of Jeremy Bentham and Mr. James Mill he turned his attention to jurisprudence, and when compelled by loss of health to abandon his practice at the bar, he accepted the appointment of Professor of Jurisprudence in the University of London, which was founded about the same time. He was compelled to resign his appointment a few years later, as no provision had been made for the chair of jurisprudence beyond class fees, and these proved insufficient. In the same year he published his *Province of Jurisprudence Determined*, a work little appreciated at that time by the general public, but

which, in the estimation of competent judges, placed him in the highest rank among writers on jurisprudence. In 1833 he was appointed a member of the Criminal Law Commission. This post was not to his taste, as he had no faith in the efficacy of such bodies for constructive purposes. He was afterward appointed a member of a commission to inquire into the grievances of the Maltese. He returned to England in 1838, but owing to poor health soon removed to Germany with his family, living at Carlsbad in summer and at Dresden and Berlin in winter. The revolution of 1848 compelled him to return to England, and he settled at Weybridge, where he died in December, 1859, universally respected for the dignity and magnanimity of his character. After his death his lectures on the principles of jurisprudence were prepared for publication by his widow under the title of *Lectures on Jurisprudence*, being a sequel to *The Province of Jurisprudence Determined*, etc. On this work his fame now rests. (For a further statement of his position in political science, see POLITICAL SCIENCE.)

AUSTRALIA AND SOCIAL REFORM.

I. STATISTICAL.

The island-continent of Australia, with its area of about 3,000,000 square miles, or nearly that of the United States exclusive of Alaska, is composed to-day of the five provinces of New South Wales, Western Australia, South Australia, Victoria, and Queensland. Says a writer in the *Review of Reviews* (American, May, 1895):

"Australia is the commercial wonder of the nineteenth century. The first white man settled there in 1788, and it was so little known that until 1802 it was called simply 'The Great South Land'; and yet in 1890, only 88 years after the country was named, with a population of only 3,784,000, its foreign commerce for the year amounted to \$642,500,000! . . .

"A bare enumeration of the resources, the commerce, and the enterprises developing in Australasia would fill a volume. For the purpose of this statement, suffice it to say that Australia alone in 1893 owned 10,400 miles of railroad, 75,500 miles of telegraph line, and entered and cleared shipping from foreign ports to the amount of 17,983,000 tons; that it owns 1,500,000 horses, 9,000,000 cattle, and 98,000,000 sheep, the total value of its live stock being \$330,000,000; that it owns a navy of 33 small but modern vessels; that the cities of Sydney and Melbourne compare favorably with Paris and Washington for cleanliness and beauty; that it spends \$5000 a day on telegrams to England alone; that in 1893 it produced \$35,000,000 worth of gold—nearly one fourth of the world's annual production; that its annual production of coal is nearly 4,000,000 tons; that its annual wool clip averages a value of over \$100,000,000; that it is the focus of a system of steamship lines radiating to all parts of the globe; and is inhabited by a people of unsurpassed intelligence and aggressive energy, and is possessed of boundless resources yet untouched."

Mr. Fenton, the assistant Government Statist, Victoria, has issued a comparative return of the population of the colonies for 1891 and 1894, from

which it appears that the population of Victoria, during the three and three quarter years, increased to the extent of 38,699, or 3.39 per cent.; New South Wales increased by 119,216, or 10.53 per cent.; Queensland by 51,437, or 13.06 per cent.; South Australia by 31,971, or 9.98 per cent.; and West Australia by 32,290, or 64.86 per cent. The total population of Australia on December 31, 1894, is estimated at 3,310,183—an increase of 273,613 on 1891, or 9.01 per cent. Victoria is estimated to have a population of 1,179,104, and New South Wales, 1,251,450.

Before passing to a consideration of the separate colonies, it should be noted that there is a strong movement toward the federation of all the Australian colonies. This was first proposed as early as 1852, but no steps were taken till about 10 years ago, when there was so much agitation on the subject that Parliament passed a bill permitting the formation of a Federal Council for deliberation only. Such a council met in 1886 and four times afterward, but being only deliberative, gave little satisfaction. January, 1895, however, the pioneers of the five Australian colonies met at Hobart and adopted a resolution recommending a convention of representatives chosen by the electors of each colony to draft a constitution to be submitted to the electors, and if it be adopted to secure its legislative enactment.

New South Wales, the oldest of the provinces, may be said to have begun, with the founding of Port Jackson, as a penal settlement of England in 1788, 18 years after Captain Cook had explored the east coast. For 50 years it continued more or less of a penal settlement, tho by 1821 the colony had made a fair start in free industrial progress. A constitution establishing a "responsible government" was proclaimed in 1855. There are two houses, the Legislative Council and the Legislative Assembly. The former had, in

New South Wales.

1893, 73 life members appointed by the crown; the latter, 141 members chosen by 74 constituencies. The area of the colony is 310,700 square miles, with a population, in 1893, of 1,197,650, of which, in 1891, 8280 were aborigines, 140,041 persons were engaged in industries and 136,375 in agriculture. Education is under State control, tho many private schools and colleges exist. There were, in 1892, of State schools: 5 high schools, 231 superior schools, 1690 primary public, 348 provisional, 341 half-time schools, 85 house-to-house schools, and 15 evening schools. In 1892, the expenditure on State schools was £768,395. There are 723 private schools. The University of Sydney received from the Government a yearly subsidy of £18,100 in 1892. There are 60 jails, and, in 1892, 56,350 convicts, and 1411 sent to higher courts.

On March 31, 1893, there were 56,378 holders of land over one acre, holding 38,156,547 acres of freehold and 4,425,934 of leasehold land. 1,003,625 acres were under cultivation. Wheat had 452,021 acres, yielding 6,817,487 bushels. (See AGRICULTURE.) Gold is largely mined, having been discovered in 1851. The value of gold mined to January 1, 1894, is £39,853,941. In 1893 it was £651,285. The coal-mines are very valuable, producing in 1893 £1,171,722. Silver-mines produced £3,031,720. There were, at the end of 1893, 2501 miles of government railways and 84 of private. The total cost of railway construction and equipment to June 30, 1894, was £35,855,271. The gross earnings for 1893-94 was £2,813,541; the expenses, £1,591,842. Agricultural produce is carried at extremely low rates to develop the country. The tramways are also owned by the Government. There were in 1894, 58½ miles open. The total cost of equipment was £1,248,986; the earnings, 1893-94, was £278,194; the expenses, £229,283. The debt of the colony at the end of 1893 was £58,079,033. The public wealth of the colony, April, 1893, was £172,895,000; the municipal wealth was £6,400,000, and the private wealth, £407,405,000. The imports for 1893 were £18,107,035; the exports, £22,921,223. Wool is the staple export, amounting to £10,449,911 in 1893.

Victoria, first settled in 1835, and originally a part of New South Wales, was separated in 1851; area, 87,884 square miles; population (1891), 1,140,405, including 565 aborigines; acres in cultivation, 2,600,000. Its capital, Melbourne, has a population of 491,378. The government is vested in a governor, an executive ministry of 13 members, a legislative council of 48, and a legislative assembly of 95 members (1892). Victoria is the principal gold-producing colony of Australia, producing from 1850-90, £227,482,300 worth of gold. Its climate is the most genial in Australia. Agriculture, formerly neglected, is now much cultivated.

There were, in 1892, 2140 State schools and 750 private schools. There were 9 prisons in Victoria with 1725 inmates at the end of 1892, and 22,280 convictions in 1891, with 1177 committed for trial. March 1, 1894, there were 34,549 cultivated holdings, wheat occupying 1,469,359 acres. (See AGRICULTURE.) 105,745 people were engaged in agriculture in

1891. The artisans and mechanics numbered 50,994; textile-workers, 47,296; miners, 53,278; laborers, 40,548. The value of the gold-mines from 1851-93 was £234,965,364; in 1893 it was £2,684,504. All the railways belong to the State. There were, June 30, 1894, 3020 miles open, having cost, with equipment, £37,748,563. The earnings for the 12 months previous were £2,726,159; the expenses, £1,635,419. The public debt, June 30, 1894, was £47,297,708, of which £36,443,476 was for railroads. The imports in 1893 were £13,283,814; the exports, £13,308,551. The main exports were wool, £5,103,907; gold, £2,851,179.

South Australia now includes the whole center of Australia, running north and south. It was first colonized in 1836 under the auspices of a company called the South Australian Colonization Association. The conditions were that the land should not be sold at less than £1 per acre; that the revenue arising from the sale of such lands should be appropriated to the immigration of agricultural laborers, and the construction of roads, bridges, and other public works (which provisions have been strictly observed); that the control of the colony's affairs should be vested in a body of commissioners approved by the Secretary of State for the Colonies, and the governor be nominated by the Crown.

There are two houses, the Legislative Council of 24 members, and a House of Assembly of 54 members. There were 74,711 registered electors in 1892. The population in 1891 was 220,431 on an area of 993,690 square miles. There are 262 public, 317 provisional schools, and 254 private schools. There were 90 convictions in 1892.

There were 90 convictions engaged in agriculture and pastoral pursuits, 34,820 persons; in commerce, trade, and manufactures, 46,107; in mining, 2196. In 1878, 304 acres were under cultivation in 1893, and in 1892, 5,732,615 acres were freehold and 28,433,268 leasehold. 136,269 square miles were leased for pastoral purposes. June 30, 1894, there were 1665½ miles of railroad open at a cost of £12,154,244. The cost, 1893-94, including interest charged, was £560,592; the revenue, £430,115. The debt, December 31, 1893, was £21,683,250; three fourths for railways waterworks and telegraphs. The imports in 1893 were £7,934,200; the exports, £8,463,936. The principal export is wool, value (1893), £2,001,297.

Queensland, formerly a part of New South Wales, was set apart in 1859. It is the northeastern portion of the island, with an area of 668,497 square miles. The population in 1891 was estimated at 393,863. Of the land, Government has parted with 10,258,657 acres in fee simple; 2,057,063 are in process of alienation, and 285,703,333 have been leased out for cattle-grazing, the chief industry of the colony. The capital, Brisbane, has a population of 93,000. The government consists of a governor, Legislative Council of 42, and Assembly of 72 members.

There were in 1892, 657 public elementary schools, 10 public grammar or middle-class schools, and 135 private schools. There were 203 convictions for serious offenses in 1892. In

1891, 67,992 persons were engaged in agriculture, 47,184 in industrial work, 31,771 in business. December 31, 1893, 252,078 acres were under cultivation. (See AGRICULTURE.) Gold was discovered in 1858, producing up to the close of 1893, £32,365,945. There were, June 30, 1894, 2379 miles of railway, all owned by the Government, having cost £16,980,970. The expenses for 12 months were £508,403; the earnings, £622,807. The public debt, December 31, 1893, was £30,039,534. In 1893 the exports were £9,632,662; the imports, £4,352,783; wool furnish- ing £3,572,917.

Western Australia, formerly called "Swan River Settlement," is all the western portion of Australia; area, 1,066,000 square miles; population, 49,782. A very large portion of the land is heavy timber land of great value. The climate is one of the best. A constitution was proclaimed in 1890. Perth, the capital, has a population of about 9000. The Government consists of a governor, Legislative Council, and Assembly.

December 31, 1893, only 176,378 acres were under cultivation, employing 8746 persons. There were 1184 miles of railway open December 31, 1894, about one half in the hands of the Government. The debt, December 31, 1893, was £2,873,098. The imports in 1893 were £1,494,438; exports, £918,147. The chief exports in 1893 were gold (£421,385) and wool (£244,927).

Western Australia.

II. SOCIAL REFORM.

Australia in sociology is often spoken of as the land where socialism has been more developed than in any portion of the globe, an idea which has been largely furthered by Sir Charles Dilke's *Problems of Greater Britain*. Yet while to an extent **Socialism** this is true, the statement must be most seriously qualified. Australia's reputation for socialism is largely due to two main facts: *first*, the early adoption of the eight-hour day, and *second*, the fact that almost all Australian railroads are owned and operated by the State. But it must be first pointed out that it takes more than the reduction of hours and the nationalization of railroads to establish socialism, and Australia has in some other respects been so unsocialistic as to largely obscure the effects of the socialism it has. The fact is, that it is quite as true to say that there is no socialism in Australia as that there is much. Either phrase is inexact. There is a great deal of State socialism and considerable democratic socialistic sentiment, but little more.

The State ownership of railroads in Australia has even tended to temporarily check the advance of real socialism; for investors, unable to invest or to speculate in railroads, have gone the more extensively into land speculation. Land booms have been universal. As they began to fail, capital poured in from England to keep them up and to defer, tho only finally to intensify, the inevitable collapse. Capital, too, unable to obtain sufficient interest in ordinary production, has been put into banks to obtain five per cent., compelling the banks to invest in all they could that promised more than five per cent. Hence banks bought land, conducted farms, stores, anything that promised dividends. When the bubble finally burst the banks collapsed, the whole community suffered, and Australia, with the rest of the world, has had to struggle with the unemployed. It is said by bimetalists, too, that Australia, like other portions of the globe, has suffered deeply from the appreciation of gold, or the lowering of prices, and the consequent increase of the burden of debt, especially upon the agricultural classes. These evils, bearing particularly upon the land, have given the idea of the single tax a deeper hold on Australia than in most countries, altho thus far little has been accomplished except to raise rates of land taxation, particularly in South Australia. Recently the fact that the government has been in the hands of the capitalist classes has led to the

formation of political parties turning on this issue, and often called directly capitalist and labor parties. Only, however, in South Australia has the Labor Party won much success, so that to use Australia as an example of socialism is inaccurate. It has had simply some State socialism managed by non-socialists.

With this general understanding of the situation we now take up a more detailed sketch of Australian social reform. The first formal recognition of the eight-hour day in Australasia was by the New Zealand

Eight-Hour Day. Company in the settlement of Otago, under the influence of the Rev. Thomas Burns. Its spread through Australia is largely due to the Victorian Operative Stonemasons' Society, who set the movement on foot in Melbourne in February, 1856.

An Eight-Hour League was formed of united trades, and notice given that after April 21, 1856, no union man would work more than eight hours. The strength of the artisans' position at that time in the labor market enabled them to win, and April 22 has annually been kept ever since as a public holiday, and known as the Eight-Hour Day. From Melbourne the movement spread to other parts of the colony and to the neighboring colonies, and the Eight-Hour Day has come to be regarded as normal throughout Australasia. Nevertheless, it is fully realized only by the stronger unions and skilled trades. Gained at first without any legislation, it has been found that legislation is needed to secure and maintain it, and some attempts have been made in this direction in various colonies by extending the factory acts. These are most advanced in Victoria, still leaving, however, very much to be desired. (For further details of the eight-hour movement in Australia, see **SHORT-HOUR MOVEMENT.**)

Trade-unionism has played a prominent part in Australia, but with few features of especial interest. As early as 1850 a branch of the Amalgamated Society of Engineers was established in Australia, and since that date almost every industry has formed its own organization. Strikes have not been very frequent nor of very great importance till we come to the great strikes of 1890 and 1891, which mark an epoch in the development of the Australian labor movement. For the most part the program followed has been that of the English trade-unions. (See **TRADE-UNIONS.**) In most of the Australian colonies there has been an early closing agitation, particularly in Victoria and New Zealand, but voluntary early closing has not proved a success, and satisfactory legislation has not yet been attained. In providing for the unemployed more has been accomplished. A labor bureau to obtain work for the unemployed was established in Melbourne in March, 1892, and public works undertaken. New South Wales established such a bureau in February, 1892. In Queensland one was established in Brisbane as early as 1886, and has been active ever since.

Cooperation and profit-sharing have had little development in Australia, tho the cooperative butter factories and creameries, established in Victoria in 1888, with government assistance,

have been a greater success, and now number 360. The social reform movement has mainly developed upon more radical lines, agitating for the single tax, for other methods of land reform, for woman's suffrage, for proportional representation, and recently for democratic socialism.

The great strike of 1890, which paralyzed Australian industry from August to October, originated in a difficulty between the pastoralists and the shearers touching the conditions of shearing. The pastoralists desired to conduct their industry according to rules of their own, while the shearers, on the other hand, had determined that none but union labor should be employed. In 1887 the Shearers' Union first endeavored to enforce their rules, and by 1889 relations had become so strained that no agreement could be reached. On August 18 the wharf laborers struck to aid the shearers.

Difficulties had also arisen in the shipping trade, quite apart from the shearers' dispute, owing to the discharge of a fireman named Magan from the steamship "Corinna." The unionists attributed his discharge to the fact that he was a delegate of the Seamen's Union, and called upon the employers for a conference, which was, however, refused. Great discontent had for some time existed among the marine officers, owing to the lack of accommodation on board ship. In June, 1890, they laid their complaints before their employers, and were promised a conference. In July, however, they were informed that no conference could be granted unless the marine officers of Melbourne broke off their connection with the Trades Hall Council, and those of Sydney withdrew their application for affiliation with the Trade and Labor Council. It was alleged by the employers that affiliation with labor councils, and consequent meeting on equal terms with their subordinates, would destroy discipline on board ship, but the unionists regarded this action on the part of the employers as an attack upon their organizations, and all negotiations were broken off.

In August, therefore, the marine officers struck, the wharf laborers came out a few days later, followed by the seamen and draymen, the Newcastle miners were locked out for refusing to hew coal which they believed to be intended for employers engaged in the strike, and in September the shearers were ordered to join the others. The strike spread from Victoria to New South Wales, Queensland, and New Zealand, and there was a general cessation of trade.

The Mayor of Sydney and other gentlemen offered their services as mediators, but for some time with no success. The efforts of labor leaders were at first directed to keep other bodies of men, such as the gas-workers, from joining the strike, because they feared that the funds would prove inadequate if any addition was made to the number of strikers. Eight hundred men, divided into gangs, were appointed to watch the wharves of Sydney, relieving each other every four hours; but in spite of their efforts many non-unionists reached the wharves, and were there provided with food and shelter, that they might

have been a greater success, and now number 360. The social reform movement has mainly developed upon more radical lines, agitating for the single tax, for other methods of land reform, for woman's suffrage, for proportional representation, and recently for democratic socialism.

The great strike of 1890, which paralyzed Australian industry from August to October, originated in a difficulty between the pastoralists and the shearers touching the conditions of shearing. The pastoralists desired to conduct their industry according to rules of their own, while the shearers, on the other hand, had determined that none but union labor should be employed. In 1887 the Shearers' Union first endeavored to enforce their rules, and by 1889 relations had become so strained that no agreement could be reached. On August 18 the wharf laborers struck to aid the shearers.

Difficulties had also arisen in the shipping trade, quite apart from the shearers' dispute, owing to the discharge of a fireman named Magan from the steamship "Corinna." The unionists attributed his discharge to the fact that he was a delegate of the Seamen's Union, and called upon the employers for a conference, which was, however, refused. Great discontent had for some time existed among the marine officers, owing to the lack of accommodation on board ship. In June, 1890, they laid their complaints before their employers, and were promised a conference. In July, however, they were informed that no conference could be granted unless the marine officers of Melbourne broke off their connection with the Trades Hall Council, and those of Sydney withdrew their application for affiliation with the Trade and Labor Council. It was alleged by the employers that affiliation with labor councils, and consequent meeting on equal terms with their subordinates, would destroy discipline on board ship, but the unionists regarded this action on the part of the employers as an attack upon their organizations, and all negotiations were broken off.

In August, therefore, the marine officers struck, the wharf laborers came out a few days later, followed by the seamen and draymen, the Newcastle miners were locked out for refusing to hew coal which they believed to be intended for employers engaged in the strike, and in September the shearers were ordered to join the others. The strike spread from Victoria to New South Wales, Queensland, and New Zealand, and there was a general cessation of trade.

The Mayor of Sydney and other gentlemen offered their services as mediators, but for some time with no success. The efforts of labor leaders were at first directed to keep other bodies of men, such as the gas-workers, from joining the strike, because they feared that the funds would prove inadequate if any addition was made to the number of strikers. Eight hundred men, divided into gangs, were appointed to watch the wharves of Sydney, relieving each other every four hours; but in spite of their efforts many non-unionists reached the wharves, and were there provided with food and shelter, that they might

avoid passing the pickets. The unionists were, however, successful in stopping almost all the steamer traffic, and agriculturists were prevented from disposing of their produce. Food became very dear in consequence, and butter rose to as much as 2s. 9d. a pound. It soon became evident that unless special precautions were taken great disorder would ensue, and additional police were therefore drafted into the large towns, beginning with Brisbane.

Some disorder did prevail, but was put down, and the striking unions gradually found themselves losing.

In Queensland the strike was less serious than in Victoria and New South Wales, because the Queensland Labor Federation ordered the execution of all existing contracts, and the shearers returned to work after being out only one week. In other trades it was found possible after some difficulty to obtain non-union labor; and by October the strike was practically at an end throughout the colonies.

In 1891 the shearing difficulty was renewed in Queensland and New South Wales, and a strike of much longer duration took place. At the end of 1890 the various pastoralist unions became federated, and drew up an agreement, which was rejected by the shearers' unions in January, 1891. The pastoralists, in consequence, procured free labor, and the Queensland shearers went on strike for a period of five months. In June the Shearers' Union of New South Wales refused to accept the pastoralists' agreement, and resolved by ballot to take no part in shearing unless the employers would consent to dispense with free labor. This the employers refused. Victoria remained unaffected by the strike, and in South Australia a conference was called between the two unions, which decided to allow the use of free labor. In Queensland the shearers were enabled to hold out for five months by establishing free camps in the bush, where the men on strike could be maintained at the minimum of cost. Their funds were augmented by contributions from other districts and colonies, especially from South Australia. No measures were left untried to prevent the importation of free labor from Victoria. "Obstacles were placed in the way of trains, bridges were weakened, armed mobs of men traveled about the country burning and destroying the property of the pastoralists." It was soon found necessary to call out the volunteers, and to draft troops and police to the disturbed districts to protect laborers on their way to work against the unionist patrols who watched the borders of Queensland and New South Wales, and to secure the property of the pastoralists.

Armed resistance to the government was advocated as preliminary to a general revolution throughout Australasia, and attempts were made to bring the railway servants and even the military over to the side of the strikers. Throughout March, April, May, and June arrests were frequent. Meanwhile, shearing was carried on by means of free labor, and since the strike could not accomplish its objects and funds were exhausted, it was declared off on June 15. In New South Wales, where the shearing season falls later, many attempts were made to prevent the employment of free labor, but in spite of in-

timidation and violence men were dispatched from Sydney and Melbourne, and the work was accomplished. The pastoralists, in their official statement, state their opinion that the failure of the strike shows clearly that unionism cannot overcome federation on the part of employers.

Such is an account of these strikes, abridged from the account in the report of the English Royal Commission on Labor for Australia. It was the failure of these strikes that crystallized the Australian political labor movement. The movement began in New South Wales.

Previously there had been a few working men elected as trade-unionists, but none on a distinctively labor platform. A great impetus was given to the movement by the vivid and eloquent speeches of the distinguished Radical, "the great Pro-Consul," George Grey, ex-Governor of New Zealand, South Australia, and South Africa. Although nearly 80 years old his speeches drew great crowds and excited wide influence for labor. A ministerial crisis came unexpectedly in May, before the party was ready; yet with little organization and less money the Labor Party succeeded in electing in June no less than 37 members to Parliament. For the 37 Labor members returned no fewer than 75,765 votes were cast, the total polling for all Labor candidates being 103,787; for the 49 Ministerialists returned, 90,349 votes were cast; for the 50 Oppositionists, 65,539 votes; for 5 Independents, 8849 votes. It will thus be seen that a great many more votes were cast for the 37 Labor members than for the 50 Oppositionists. Since then the growth of the party has been steady. To-day, although details of the last elections are not available, the Labor Party nominates candidates for every vacancy. In New South Wales the socialist vote with the Labor Party. The six points of their fighting platform run as follows:

1. Land value taxation.
2. Mining on private property.
3. Abolition of the Upper House.
4. Local government on a democratic basis.
5. National bank, with sole right of issue.
6. Legislative limitation of the working day to eight hours.

South Australia has not been so progressive in independent labor politics, but the first 10 candidates a Labor Party has nominated there were all elected. South Australia, being more largely agricultural than the other colonies, has perhaps in its more scattered population the reason why its labor movement is less organized than in New South Wales. What political success it has gained is due to the fact that alone among the Australian colonies (New Zealand not included) it has manhood suffrage for elections to the Lower House, with the slight property qualification for suffrage on elections to the Upper House. The result is the 10 Labor members of the Lower House above referred to, elected in 1893, and four or five members in the Upper House. All political parties, however, in South Australia bid for the Labor vote, and the Ministry is so far in favor with Labor measures that it has been called a Coalition Ministry.

Victoria has done still less in the development of a distinct Labor Party. "Laggard Victoria"

**Labor
Parties.**

the Australian socialists call the colony. There is, however, there something of a Democratic-socialist movement which has elected five socialist members to Parliament.

Queensland is marked in social reform as having the most uncompromising and revolutionary, tho not the largest socialistic Labor Party in Australia. There are 16 Labor members in the Assembly, and they are influential out of proportion to their number.

The Australian socialists assert that "the great bugbear to progress is the Upper House, or Legislative Council, as it is called. This body is based on the lines of the House of Lords in England. Its members are nominated for life by the ministry in power with the approval of the governor, who as viceregal representative has power of veto over all bills, while an actual change in the constitution itself requires the Queen's sanction."

Political reform, however, has had considerable development in Australia. (See AUSTRALIAN BALLOT SYSTEM; also, for the Australian system of land registration, see TORRENS.) There has

been considerable agitation in Australia for proportional representation, but as yet with slight results.

Political Reform. Currency reform has its various advocates in Australia, and especially bimetalists and others who declare that the great Southern Continent, like the rest of the world, has suffered from the appreciation of gold. Yet little of importance has been accomplished in the way of reform. For good or for evil, Australian finance is still ruled by English gold. Free trade and protection have played a large part in Australian politics.

Says an Australian socialist:

"In the Australian colonies the chief line of party denunciation is the fiscal issue. Either free trade or protection claimed each member of the Legislature as its victim. It was only when labor came upon the scene that a party rose pledged to 'sink' the fiscal issue as being of secondary importance to the great mass of people. Land reforms, and especially the single tax idea, have, as already stated, considerable hold in Australia, tho not at all the hold that they have in New Zealand. In Australia, South Australia leads in this. The peculiar social reform characteristics of South Australia, and especially its favorable attitude to land taxation, are probably due to the fact that it was colonized under the auspices of a company called the South Australian Colonization Association, and largely under the influence of idealists. One of the conditions was that the land should not be sold for less than £1 per acre, and that the revenue thus arising should be used for the immigration of agricultural laborers and the construction of public works. Adelaide preserves the memory of this association in the naming of some of its streets for Mill, Hare, etc."

The single tax idea was much helped in Australia by a visit from Henry George in 1890.

One point in Australia is of special interest. It is said that "Australia is a continent without an orphanage, a country without an orphan. Each waif is taken to a receiving-house, where it is cared for until a country home is found. The local volunteer societies canvass their neigh-

borhoods and send to the Children's Committee of the Destitute Board the names and circumstances of such families as they have found where children may be placed. The Children's Committee selects that home which it judges is best adapted to the development and care of the child in question. No child is placed in a family so poor that the child might suffer hardship. The foster-parents receive a sum averaging \$1.25 per week for the care of the child, and for proper clothing. When of school age the child must be in school. The local volunteer committee looks after its care and culture, and zealous neighbors often assist in watching the growth and education of these happy children. When the child is 14 years old he begins to work. His earnings are placed in the postal savings bank, and at 17 or 18 he goes out into the world an independent man. The State, at an expense of less than \$70 a year, has raised a man or woman to contribute to its wealth, and prevented the manufacture of a criminal, and the expense of courts, prisons, and reformatories."

In Victoria and the other colonies there is a cumulative voting, property owners being entitled to more than one vote. All through Australia, on the other hand, there is a strong agitation for woman's suffrage, it being delayed mainly by the disagreement as to whether to give woman's suffrage with an educational qualification or no. The conservative element favors woman's suffrage, with the qualification affixed, believing that it will serve its interests.

One problem that has vexed Australia considerably is that of the immigration and importation of cheap labor. The importation of Chinese labor is more or less common to all Australia. According to the latest returns, there were 41,000 Chinese in Australia and New Zealand, engaged mainly in mining, agriculture, shopkeeping, and furniture-making. The latter industry seems to have become peculiarly theirs. In Victoria there are 9377 Chinese, 2994 engaged in gold-mining, at weekly wages of from \$5 to \$7.50. The immigration of the Chinese, however, has, after an intense excitement, been carefully restricted in all Australia. The naturalization of the Chinese is forbidden; in New South Wales £100 must be paid for every Chinaman landed; in Queensland £500 must be paid, unless the Chinaman has a special permit.

Kanaka labor has been another "burning question." Particularly has the introduction of Kanaka labor been a source of grievance to the trade-unions of Queensland. The Kanakas have been introduced mainly to work on the sugar plantations. The claim has been that white labor was unsuited to this work in this climate, while it was a good thing for the Kanakas, they going back to their Pacific island to carry home the benefits of civilization. On the other hand, the trade-unionists have asserted that this was simply an excuse to get cheap labor, that the importation of the Kanakas was simply a slave traffic, the Kanakas being decoyed from their island by the promise of *fire water* and being abused on the voyage, as in the horrors of the old slave ship. There is probably some exaggeration in this, but that the system is simply a way to get cheap labor there can be no question.

It was proposed at one time to introduce coolies from India into Queensland, as was done into South Australia in 1882, but the Indian Government would not allow the coolies to be imported to work in the mines, and the Queensland planters preferred Kanakas that had no government to protect them. Finally, however, mainly from the agitation of the trade-unions and the Labor Party, aided in part by the British and Foreign Anti-Slavery Society, after a struggle of 20 years Kanaka labor has become so strictly controlled as to be practically ended. In Queensland the latest victory of the Labor Party along this line has been to compel the government to turn the Kanakas out of the mail steamships of the British-India Company and to maké the company carry Europeans in their place. Such are the main developments of social reform in Australia apart from State socialism. To this, however, we must give especial attention. The following account of Australian railroads is abridged from the United States Consular Report for August, 1894, by Daniel W. Maratta, consul-general at Melbourne. He says :

"By way of showing, comparatively, the progress of railways in Australia, it may be remarked that here there is one mile of railway to each 344 inhabitants, as against 1888 in Great Britain, and 350 in the United States.

Railroads. "The aggregate of the national debt of the colonies would appear to be disproportionate when compared with the limited population of Australia, and complaints have frequently been made in the English press that the colonies are unmindful of the *feeling lenté*, and all the good advice that convenient adage is supposed to infer. The adverse criticism has not, however, up to the present had a shadow of justification. Let it be remembered that the money borrowed has not been sunk in undertakings which will give no return, but has been expended in works which are productive, yielding a direct return on the capital, and representing a greater value than the original cost; for instance, the New South Wales lines, costing about £34,500,000 (\$167,870,000), are estimated to be worth more than £40,000,000 (\$194,640,000). Further, the money has been spent in developing large resources, which add to the wealth of the colonies. It is wise to emphasize this point, as it seems to have been overlooked to a large extent. In Europe the national debts of the various countries have been incurred principally through the expenses of prolonged wars, and the money has gone beyond recovery; but in these colonies the expenditure is represented by public works, which are more valuable than the entire national debt, and pay a direct return, in some cases, equal to the interest due upon the capital invested.

"The railways in all the colonies, with the exception of one or two lines, belong to the State. In New South Wales, the first railways were projected as far back as 1846, and a few years afterward a company—the Sydney Tram and Railways Company—was formed. The company undertook the construction of a line from Sydney to Parramatta, a distance of 14 miles; but as the capital became absorbed before the work was completed, the company was unable to carry on operations, and in the end the Government had to take the line, which was finished on September 26, 1855.

"A company also contemplated constructing a line from Newcastle to Maitland, but was unable to surmount the preliminary difficulties.

"There are in New South Wales two important public lines constructed and maintained by private companies: (1) the railway between Deniliquin, in Riverina, and Moama, on the Murray River, 45 miles in length; (2) a private line between Broken Hill, Silverton, and the South Australian border (35 miles), connecting with the South Australian lines, which, owing to the large traffic done with the Broken Hill mines, has been a financial success.

"There is a considerable number of private minor lines, principally running to coal mines. In the Newcastle district there are 200 miles of private lines almost entirely used for the coal traffic.

"In Victoria, the railways are under State control, altho they were initiated by private enterprise. By

March, 1853, three companies had been incorporated and secured extraordinary concessions in the shape of land and guaranteed interest. The Melbourne and Murray River Company was forced to sell to the government in 1855, before any of their lines had been opened for traffic. The Geelong-Melbourne Company followed the same course in 1860, and only the Hobson's Bay Railway Company held its own for some years, but in 1878 it sold its interests to the government for the sum of £1,320,800.

"The system of placing the railways under the management of commissioners, and practically separating them from political control, has been adopted in the four principal colonies, and, as already stated, experience is proving that the change has been a very wise one.

"In Western Australia railway construction is in its infancy. There are 204 miles of line constructed and managed by the Government, and, in addition, about 453 miles of lines are owned by private companies. The first line was opened as recently as July, 1876, and latterly much progress has been shown, the land-grant system having to some extent been adopted.

"In Queensland, the railways are owned by the State, the first line having been opened in July, 1865.

"The railways of the colonies have been comparatively free from terrible accidents. During the period 1892-93 there were no fatal accidents upon New South Wales railways to passengers from causes beyond their own control, and the proportion of injuries to passengers was 0.4 per 1,000,000. . . ."

But this is not a complete view of Australian State socialism. It may be supplemented by the following quotations from Sir Charles Dilke's *Problems of Greater Britain* :

"The railways are used for the spread of education, and in New South Wales and some other colonies the school children are carried free of charge. In Victoria remissions of fares are made in the case of students in the schools of mines and in the schools of design. Specially low rates exist in all the colonies for suburban traffic. The fares in the neighborhood of Melbourne, for a district nearly 30 miles across, are, for single journeys, 1*d.* a mile, first-class, and 3/4*d.* a mile second-class; and return tickets are given at 3/4*d.* a mile, first-class, and 3/4*d.* a mile second-class; while monthly, quarterly, half-yearly, and yearly tickets are granted at great reductions even upon these low rates. The result is a wonderful spread of suburban railroad traveling, and the custom in Victoria is so developed that out of the large number of persons working in Melbourne who come in by train every day, a considerable proportion come to the town a second time in the evening to visit the theaters. The lowness of railway fares in Victoria is the more striking when we remember that wages are twice as high for shorter hours as they are in England, and that coal costs nearly twice as much. No one in Victoria now advocates private ownership of railways (p. 108).

"Not only have the State railways of Victoria been placed under non-political management, but this has been the case with the public departments generally. The commissioners appointed to free the public service from the former incubus of political patronage are as well paid as the judges, and as free from pressure of any kind. The Civil Service Commissioners of Victoria, who are three in number, began their work some five years ago by visiting every place in the colony where public officers were stationed, learning the nature of their duties, determining their relative importance, and classifying the officers accordingly. Salaries were systematized and made uniform in all departments, and appointments and promotions are now determined by the board (pp. 199-200).

"The principle of Government cooperation with localities has been carried into a large number of different fields in the colony of Victoria: tramways, for example, are constructed by municipalities on Government loans, the State borrowing money for the municipalities on the best terms which the colony can command in the market, but the municipalities ultimately becoming the owners of the lines (p. 203).

"In Victoria the municipalities will become the owners of the tramway lines without purchase and without payment. The tramway companies, in the mean time, are forced to repair the adjoining roads, and the municipalities have not merely the reversion of the lines themselves, but in Melbourne alone have obtained from the companies nearly 40 miles of excellent wood pavement, while the companies are paying a large dividend upon their shares (p. 203).

"But the most notable instance in Victoria of the characteristically Victorian effort to unite central action with local knowledge and local control is seen in the irrigation system, which will change the whole physical aspect of the country, as well as affect its political future (p. 204)."

So far, Mr. Dilke. It must be remembered, however, that there is another side. State socialism is not socialism, and State socialism in Australia has many blots. Perhaps the best statement of the unfavorable view is the chapter on *State Socialism in the Antipodes*, by Charles Fairfield, in *A Plea for Liberty*. Among other things, Mr. Fairfield says :

**Unfavorable
View of
Australian
Socialism.**

"During the last 20 years professional office-holders, paid legislators, half-educated dreamers and enthusiasts in Australasia have attempted to satisfy these new and vague longings ; to enact the part of a State socialist 'stage uncle' toward the Democracy there, but have never had sufficient thoroughness or daring to carry out socialistic or collectivist maxims and theories of government and society, maxims and theories which, at all events, are consistent, precise, and of logical obligation, if once we grant the socialist's premises. State socialism in the Antipodes has therefore been a hybrid affair—the tentative experiment of men who hoped to do partly, and without committing themselves too far, what thoughtful socialists and collectivists tell us they can do completely, if we will only give them a free hand. Experiments in cryptosocialism, tried upon a society at base free, commercial, modern, English, would long ago have broken down on the financial side, had it not been that the legendary repute of those lands for natural wealth, such as gold, wool, a fruitful soil, and a fine climate, has tempted investors in Europe to fling their money at the heads of Australasian borrowers. Latterly, as the frightful cost and necessarily unproductive results of State socialism became apparent to colonial ministers, they have, to prevent a collapse of the whole thing, been driven to apply for ever-recurring loans in Europe on false pretences. . . . (153). The truth is, that nothing definite can be known about the finances of the Australasian colonies.

"State socialism there dares not present a genuine balance sheet. As may also be said of the French Republic at this day, there is in Australasia no system of public accounts similar to that which prevails in Downing Street. In Victoria, New South Wales, Queensland, South Australia, and New Zealand the control of expenditure by local parliaments is really very weak. No attempt has been made to introduce the imperial system of simple, methodical, and exact account-keeping. Audit or check upon public expenditure is loose and ineffective in all the colonies.

"If we in England really understand the system of book-keeping, and the object on which debts are spent in Victoria, we know more than the colonists themselves know.

"Meanwhile, for years past reports of imaginary surpluses, as well as misleading and worthless 'official' statistics, have been circulated in the Australasian colonies, and have been carelessly reproduced here. The statement is constantly put forward, for example, that the Victorian State railways, which are supposed to represent an expenditure on productive public works of the bulk of the money borrowed by that colony since 1865, honestly earn a surplus in excess of the interest on their cost. That statement is not and never has been true. The memorandum from the Railway Commissioners read with the budget statement in the Victorian Assembly on July 31, 1890, at last frankly admits that the earnings of the State railways fell short of the accruing interest for the year by more than £220,000." . . . (155).

II., 1893); Sir Charles Dilke's *Problems of Greater Britain*. For the unfavorable view of so-called Australian socialism, see Charles Fairfield's chapter on *Socialism in the Antipodes*, in *A Plea for Liberty*. *The Journal of the Department of Labor of the New Zealand Government*,

a monthly (ed), published by the Government printer, S. Costall, Wellington, N. Z., gives considerable information about Australia.

AUSTRALIAN BALLOT SYSTEM.—

The Australian ballot system was introduced into the United States in 1888. The purpose of this system is to secure secrecy of the ballot and prevent partisans from intimidating and corrupting voters. It was adopted first by the State of Massachusetts and the city of Louisville, Ky. The so-called Saxton Bill, which passed the New York Legislature in 1888 and 1889, embodied the principle of this system, but it was declared unconstitutional, and vetoed by Governor Hill. By his advice a reformed ballot bill was introduced in the Legislature in 1889, but was not passed. In the following year a compromise of the Hill and Saxton bills resulted in another bill, which was successful, and which was amended in 1891.

In 1889 the Legislatures of several States followed the lead of Massachusetts, and passed laws adopting this system of voting. These States, in the order given, were as follows : Indiana, Montana, Rhode Island, Wisconsin, Tennessee, Minnesota, Missouri, Michigan, and Connecticut. These laws were similar to that of Massachusetts, with the exception of that of Connecticut, which differed considerably from it. In 1890 laws were passed by the Legislatures of Washington, New York, Maryland, New Jersey, and Vermont, which were more or less modifications of the Australian system.

In 1891 laws founded upon the Australian system were adopted by the Legislatures of the States of Arkansas, California, Colorado, Delaware, Idaho, Illinois, Maine, Nebraska, Nevada, New Hampshire, North Dakota, Ohio, Oregon, South Dakota, West Virginia, and the Territory of Arizona; and in 1892 Iowa and Mississippi followed suit. Thus there are (1895) but 10 States and Territories which have not adopted this method. These are Alabama, Florida, Georgia, Kansas, Louisiana, North Carolina, South Carolina, Virginia, and the Territories of New Mexico and Utah. A reformed ballot bill passed one branch of the Kansas Legislature.

The distinctive feature of this system is that the names of all the candidates are placed on one ticket, and the names of all for whom the citizen does not wish to vote are crossed off by a blue pencil, provided by the authorities. Directions are given on each ticket, clearly printed in red ink, as to how many candidates must be voted for. If one votes for more than the limited number of candidates his vote is irregular.

In New York and New Jersey the laws require that each party ticket be printed on a separate ballot, and therefore no marking is required for straight voting. In New York the paper ballot is permitted, for the benefit mainly, it is claimed, of the blind and the illiterate. In all the other States which have adopted this system the single ballot is used. The names of all the candidates are printed on one sheet, and the voter indicates his choice by marking. There are two ways of grouping the names of the candidates. In the Australian plan the titles of the offices are alphabetically arranged, the names of the candidates being attached, and also usually their party connection.

AUSTRIA AND SOCIAL REFORM.—Austria, or Austria-Hungary, its present political name, grew up from the small margraviate Austria (German: *Osterreich, Oesterreich*—*i. e.*, the Eastern Country) founded by Charlemagne in the eighth century, and raised to a duchy by Emperor Frederic I. in the twelfth century, the crown of which is hereditary since 1282 in the family of the Habsburgs (their name deriving from the Habichtsburg or hawk castle in Switzerland) and since 1780 in the branch of Habsburg-Lorraine. It embraces now the kingdoms of Hungary, Bohemia, Galicia, Dalmatia, and Croatia-Slavonia; the archduchies of lower and upper Austria; the duchies of Salzburg, Styria, Carinthia, Carniola, Silesia, and Bukovina; the principalities of Transylvania, Tyrols, and Vorarlberg; the margraviates of Moravia and Istria; and the counties of Goerz and Gradisca. (The Turkish provinces of Bosnia and Herzegovina, occupied after the suppression of the mutiny of 1878, have been since under the administration of Austria-Hungary, but are not yet formally incorporated with it.)

I. STATISTICS AND HISTORY.

Austria has an area of 246,942 square miles, and, according to the estimates of the census of December 31, 1890, a population of 43,000,000. With regard to nationality it consists of 11,000,000 Germans,

Population.

7,000,000 Magyars, 7,000,000 Czechs (Bohemian, Moravian, and Slovak), 5,000,000 Ruthenians, 4,000,000 Poles, 3,000,000 Serbs and Croats, 3,000,000 Roumanians, 2,000,000 Slovans, and 1,000,000 Italians. With regard to religious belief there are 27,000,000 Roman Catholics, 5,000,000 Greek Catholics, 4,000,000 Protestants, 4,000,000 Byzantine Greeks, 2,000,000 Jews, and 1,000,000 Armenian Catholics, Unitarians, and non-Christians. With regard to occupation the population consists of 12,000,000 farmers and farm hands, 4,000,000 manufacturers, 2,500,000 day laborers, 1,500,000 house servants, 1,000,000 commercial people, 400,000 proprietors, pensioners, and rentiers, 280,000 active soldiers, 200,000 miners and smelters, 150,000 professors, artists, and authors, 100,000 teachers, 100,000 lower government servants, 90,000 government officials, 60,000 ecclesiastics, 25,000,000 family members, and a remainder of 700,000 of various or unknown occupations.

These statistics show the very great diversity of race, language, religion, and condition which prevail in the empire, and an understanding of which, in part at least, is necessary to understanding the social problems and conditions of the empire. Says the Report on Austria of the (English) Royal Commission on Labor:

"The modern history of Austria is a history of territorial contraction combined with a process of political consolidation, resulting in the increased force that comes from a concentration of energy. The wars which preceded the downfall of the Napoleonic despotism, and the reactionary and autocratic policy of the Emperor Francis and his minister Prince Metternich make the history of the earlier years of the century comparatively unimportant from an economic point of view. It was only with the 'great uprising' of 1848 and the accession of the present emperor that social questions were once more brought prominently forward; and though, when the fear of revolution had passed away, the promises made under the immediate pressure of danger were for the most part forgotten, the interests of the working classes and their claims to consideration were never again entirely neglected, and, as Professor Bryce has said of Germany, 'after the first reaction had spent itself . . . a real though slow progress toward free constitutional life' may be observed. . . .

History.

"When the Emperor Francis Joseph began to reign, the popular movement of 1848 was at its height in his dominions. The revolt and reconquest of Vienna and the national risings in Italy, Bohemia, Croatia, and

Hungary immediately preceded his accession to the throne left vacant by the abdication of Ferdinand II. The declaration of Hungarian independence and the prompt suppression of the Magyar patriots, with Russia's help, the reconquest of Northern Italy, and the abrogation of the constitution granted to Austria in 1849 followed closely on his acceptance of the imperial crown. Then came a period of renewed absolutism, when Austria, in close alliance with the Catholic party, ruled as before over a loosely compacted mass of heterogeneous nationalities and acted as the leading spirit in the Germanic Confederation. The war of Italian independence, however, and the gradual rise of the Prussian power under King William I. and Count Bismarck completely changed the position of affairs. The quarrel over Schleswig-Holstein and the war between Austria and Prussia led in 1866 to the formation of the North German Confederation and the severance of Austria, 'with her German population of 7,000,000,' from the Germanic body. The final loss of Italy followed, but a remnant of the Italian-speaking population still remained in the Adriatic provinces, and thus Francis Joseph was left to rule an empire in which the German nucleus was almost overwhelmed by alien elements—Magyar, Slav, Roumanian, and Italian—and, as Mr. Pyffe puts it, 'the political life of Austria became a series of distracting complications.'

"The period between 1866 and Count Taaffe's accession to power, in 1879, a time when Austria played an important part in European politics, was also marked by many, and, on the whole, salutary changes in the internal constitution of the empire.

"After the war with Prussia the Emperor assumed a still more conciliatory attitude, especially toward Hungary. Count Belcredi, the supporter of Federalism and of the national aspirations of the Slavs, was dismissed from office in February, 1867, and the reconciliation with the Magyars was finally cemented by the coronation of Francis Joseph as King of Hungary (June 8, 1867), and the establishment of the dual system which still prevails in the empire.

"According to this system, the kingdoms and provinces which make up the dual monarchy or empire of Austria-Hungary are divided into two groups, the 'Austrian dominions' and the 'Hungarian dominions,' united under one dynasty and having certain specified home and foreign affairs in common with one another. To Hungary were granted freedom of the press, equality of all citizens before the law, the right of combination and public meeting, and full religious toleration, while the control of taxation and the power of increasing the army were intrusted to the representatives of the people sitting in the Hungarian Reichstag, or Legislative Assembly, and in the Croato-Slavonian Diet. At the same time Austria received a responsible ministry, acting in concert with a bi-cameral Reichsrath. Special delegations, returned by the Austrian Reichsrath and the Hungarian Reichstag, were to legislate for all matters in which both component parts of the empire were concerned, while such subjects as were not expressly reserved to the Reichsrath were to be debated in the provincial diets. In addition to the Imperial Ministries of Foreign Affairs, War, and Finance, special departments were formed for the government of the dependencies represented in the Reichsrath and of the dependencies of the Hungarian crown. Subordinate to these departments were the provincial authorities, and beneath these again were the district and communal authorities. There were also commercial courts and various provincial and district courts of justice, with appeals to the supreme judicial courts. Industrial questions, as before, usually fell under the jurisdiction of the ordinary civil authorities. The political events which followed the conclusion of the long Hungarian struggle, the Franco-Prussian War, and the consolidation of the German Empire, need hardly be touched on here, since they only indirectly affected the Austrian labor question. More important from an economic point of view is Count Hohenwart's unsuccessful attempt to reconstitute the empire on a 'national' basis and to place Galicia and Bohemia in the same position as Hungary. The separatist tendencies of Bohemia were crushed, but the next few years (1872-74) were marked by a reaction against the influence of the Papacy, and by the passing of an Electoral Reform Bill, which substituted the system of direct election of the members of the Reichsrath for the former system of indirect election through the provincial diets, though it preserved the principle of proportional representation. The Eastern complications, which resulted in the Treaty of Berlin (July 13, 1878), brought an increase of territory to Austria by the cession of Bosnia and Herzegovina, and added a new

element to the intricacy of the internal relations with which Count Taaffe was called on to deal when he became Prime Minister in 1879."

Since this event the history of Austria has been closely identified with the social problems of which we treat in the second portion of this article.

The Budget estimate for the common affairs of the monarchy was, in 1895, 152,058,203 florins; the estimate of the total expenditure was 152,058, of which 133,027,338 were for the army and navy. The total debt of Austria in 1893 was 6,064,006,000 florins, the florin being about 50 cents. The revenue of Austria proper for 1893 was estimated at 619,105,779 florins, 110,045,000 from direct taxes, 293,509,632 from indirect, 123,857,130 from railways. The expenditure was estimated at 618,694,237 florins, 4,650,000 for the imperial household, 101,268,120 for the ministry of commerce, 158,328,938 for interest and sinking fund on the public debt.

The peace footing of the Austrian army is 347,297 troops, the war footing 1,753,583. In case of war the number of men who would be obliged to serve in the Landsturm is over 4,000,000. The navy consists of 117 ships, 11 armor-clad.

Austria is principally an agricultural State, her large plains in Hungary, Bohemia, and Moravia producing great quantities of surplus grain, mostly exported to Germany and Belgium; fine cattle are raised in her mountainous part, as well as in the "Pusztas" (prairies) of Hungary. Lower Austria, with Vienna, Bohemia, Silesia, Moravia, and Styria, are the great manufacturing centers, and export a great amount of hardware, sugar, glassware, flour, woolen goods, gloves, linen goods, and articles of luxury, as amber, meerscham, leather goods, etc. Minerals, poultry, fish, wool, and wine are also produced and exported in large quantities. Unfortunately the profits of all the natural richness and the hard work of the laboring classes go largely into the pockets of a few great estate owners, manufacturers, bankers, and

Industry.

trusts. The lower classes are overtaxed, live very poorly, often near starvation, but they are beginning to be aroused by socialistic ideas to claim their share of the profits from the real or seeming vampires, and their malcontentedness is directed principally against the nobility and the Jews.

(For statistics as to the division of the soil, see AGRICULTURE.)

The export and import trade of the Austrian Empire has developed notably during the last two decades, and the total value of the foreign trade has increased almost threefold since 1853. It is true that the rapid increase between 1879 and 1883 was followed by a period of comparative depression, but since the falling off was most marked in the department of manufactured goods, it is probable that it may, in part, at least, be attributed to increased manufacturing activity in Austria itself.

The total exports of Austria, including Hungary, Bosnia, and Herzegovina, were, in 1893, 799,200,000 florins and the imports 683,200,000. There were, January, 1894, 18,038 miles of railway in Austria and Hungary, of which 7124 were owned and 6138 more were worked by the State. (For further consideration of Austrian railways, see the second portion of this article; also RAILROADS, AUSTRIA.)

Austria had, in 1891, 18,666 elementary schools; Hungary, 16,870. Hungary has also 729 institutions for the care of young children, 89 humanistic schools, and 30 prison schools. There are in the empire 437 middle schools, 11 State universities, 45 theological colleges, 7 Government technical high schools, 1500 special technical schools (business, agriculture, art, music, etc.).

According to official statistics, 86 per cent of the children of school age were attending school in Austria in 1891.

There are 16 penal establishments in Austria, and in 1890 there were 29,050 convictions for crime in Austria, 5512 convictions for less serious offenses, 536,301 for misdemeanors; in Hungary, in 1889, 10,880 for crime; 75,964 for less serious offenses. In Austria, 207,915 persons were relieved in 1890, besides 53,152 persons relieved in poorhouses.

II. SOCIAL REFORM.

The history of modern social reform in Austria begins with the revolutions of 1848. The years previous to this had been marked in industrial evolution mainly by the decay of the ancient guilds and the development of modern ideas.

The revolutions of 1848 witnessed national political uprisings in Vienna, Italy, Bohemia, Croatia, and Hungary. A constitution was granted to Austria, but was soon abrogated and imperial absolutism in close alliance with the Catholic power reigned supreme. In 1859, however, an industrial code was passed which enjoined upon all manufacturers the maintenance of their relations with the guilds, or the restoration of such relations where they had been discontinued, but the guilds continued to decline in spite of all efforts. Progress was mainly political.

In 1866 Prussia gained the severance of Austria from the Germanic confederation, and Italy soon after gained her freedom. Hungary, too, grew more and more restless, and the Emperor had to grant concessions, till the present dual political system was organized in 1867. Since 1879, when Count Taaffe came into power, the government has been compelled to do more and more for the working classes. This, however, has been forced upon the government by the labor party, which in Austria, more than in most countries of Europe, has been purely socialistic.

A Viennese Working Men's Mutual Improvement Society was started under the influence of Lassalle's agitation in 1867; and on Lassalle's birthday, April 11, 1869, it published the first number of the *Volksstimme*. In 1869 delegates were sent to the German Social-

Socialism.

ist Congress at Eisenach. The Government now prohibited all socialist meetings, and the socialist agitation had to be concentrated on the effort to obtain freedom of coalition and universal suffrage. In 1872 a Radical Labor Party was formed by a few dissenting members, while the members of the old Labor Party were called the Moderates. The Radicals favored Federalism and the national aspirations of the Czechs, and worked with the Feudal Clerical Party, with whom they had nothing in common save to defeat the Liberals. The Moderates worked with the Liberals, because they believed that nothing could be done for socialism till the old priestly and feudal ascendancy was broken up.

After the German laws against the Social Democrats were passed in 1878, the Austrian socialists, in part, lost heart. The Radicals declared for anarchism and the Moderates for the Liberals. The Austrian Christian socialists supported the Ministry of Count Taaffe in legislative reforms. Between 1882 and 1884 the anarchists attempted much violence in Austria; the Government resorted to strong measures, and the socialist papers suffered much. Nevertheless, work went on, the trade-unions became the camping grounds for the socialists, and much propaganda was carried on. From 1886 the movement has made steady progress. In 1888 the conference at Hainfeld, largely through the influence of the *Gleichheit*, Dr. Adler's paper, the Moderates and those Radicals who were not anarchists came together.

This conference, which sat till January 1, 1889, was attended by representatives of all the divisions of the Austrian Labor Party, in the Slav and Romance, as well as in the German provinces of the empire. The program or declaration of principles then drawn up, and accepted with only three dissenting voices, forms the best illustration of the attitude adopted by the new party. "With this declaration," says Herr Karl Kautsky, who himself took an active part in the conference, "the Austrian Labor Party again took up the position assumed by modern scientific socialism, the same position which German Social Democracy has adopted."

The program of the New Austrian Labor Party, as presented to the Hainfeld Conference, runs as follows: "The Social Democratic Labor Party in Austria aims at winning for the whole people, without distinction of nationality, race, or sex, freedom from the fetters of economic dependence, abolition of political disqualifications (Rechtslosigkeit), and deliverance from intellectual degradation (geistige Verkümmern). The cause of the present unsatisfactory conditions is not to be sought in isolated political provisions, but in the fact which molds and governs the whole state of society, that the instruments of labor (Arbeitsmittel) are monopolized by a few proprietors (Besitzender). The

working classes, who have the power to labor, thus become the slaves of the capitalistic class, who possess the instruments of labor, and whose political and economic supremacy finds expression in the modern State. Private ownership in the instruments of production, which indicates politically a State founded on class distinctions (Klassenstaat), signifies economically the increasing poverty of the masses (Massenarmuth), and the growing degradation of ever-widening sections of the population (Volksschichte)."

The party thus, as was recognized in the speeches which followed the introduction of the program, began by adopting the standpoint of Karl Marx, and recognizing that a certain social and economic development must precede the full acceptance of socialist principles.

The Hainfeld Conference gave the Austrian Labor Party a compact organization and a definite plan of action, and its effects were soon felt in the rapid advance made by the Social Democratic movement. The socialist papers obtained a wider circulation meetings, for the propagation of socialist doctrines were held, and many new workmen's associations were founded. The political and economic conditions of the time further favored this development. In 1889 the Liberal Party in the Government appointed a committee to inquire into the advisability of establishing Labor Chambers in Austria. Altho this committee had no practical result, as far as its immediate object was concerned it appears to have brought together a large number of workmen from all parts of the empire, and to have thus indirectly helped on the cause of Social Democracy by acting as an international Austrian conference on a small scale.

Strikes and agitation became common, and the Government again tried repression. Papers were suppressed and the editors of the *Gleichheit* arrested on charges of anarchism. Nevertheless, a second general congress was held at Vienna, June 28-30, 1891.

According to the report presented by the Austrian Social Democrats to the International Congress held at Zurich in July, 1893, the events of the second conference of Vienna convinced the Austrian bureaucracy that the existence of a powerful and determined Social Democratic organization among the working classes could not be ignored, and, recognizing this fact, the authorities permitted the resolutions of the conference to be quietly carried out, and a Social Democratic party to be formed.

The winter of 1892 was marked in Austria by agitation on the part of the Social Democrats against the censorship of the press.

The early months of 1893 saw the opening of "a campaign in favor of universal, equal, and direct suffrage," which was maintained until the autumn session of Parliament. In April universal suffrage was granted in Belgium, and the victory of the Belgian workmen was hailed by the Austrian Social Democrats as an earnest of their own future success.

It was under these circumstances that the May Day celebrations of 1893 took place throughout the empire, and they developed into a gigantic demonstration, not for the eight-hour day only, but also for the suffrage. In Vienna 150,000 men and women marched in military order through the streets. A few weeks later the political victories gained by the German Social Democracy at the ballot-box were celebrated throughout the empire in a series of magnificent meetings, at all of which the pledge was taken to do battle for the suffrage. In July 500,000 working men and women gathered in the very heart of Vienna and declared they would neither rest nor be deterred by any sacrifice until they had won.

On October 10 Count Taaffe introduced his bill, granting a very much enlarged suffrage. Nevertheless, altho by the provisions of the new bill the number of voters in Austria would be doubled, the Social Democrats would only agree to accept it as a move in the right direction. This was the attitude consistently maintained in the various meetings of the working classes which followed on the introduction of Count Taaffe's scheme; and when the German Liberals, the Feudal Clericals, and the Poles, representing respectively the *bourgeoisie*, the landed interest, and the National Party, combined to oppose the bill and to bring about the resignation of the Ministry, Dr. Adler stated that the Social Democrats would "heartily welcome the new constellation in the political heavens, seeing that it at last united all the propertied and privileged classes against the onslaught of the proletariat," and that "now the brawls and squabbles of the nationalities would cease, and the war of classes would begin." The subject of the suffrage is now the principal one before the Austrian Parliament.

Other evidences of the progress made by the agitation of the Social Democracy are the formation of numerous political clubs and the strength of their press. At present the party owns 13 German, eight Czech, and two Polish political papers, exclusive of trade journals. These papers are all weeklies and semi-weeklies, and their circulation grows rapidly. The *Arbeiter-Zeitung*, published in Vienna, has an edition of 19,000, the edition of the Vienna *Volks Tribune* is 9,000, the circulation of the *Arbeiterinnen-Zeitung* (female workers' paper) is 4,000.

The great obstacle to the spread of socialism in Austria is the presence of the anarchists, with whom the socialists are continually confounded by the Government, tho the two parties are now completely distinct. Roman Catholic Christian socialism has had considerable development in Austria, under the patronage of Prince Lichtenstein and others, but it has meant little more than the Church of Rome taking an interest in political and social questions from the ecclesiastical paternal standpoint. The distinctive trade-union movement in Austria runs parallel with the socialist movement. The Industrial Code of 1859, trying to compel employers and employees to unite in trade guilds, had failed. In 1869 a demonstration in Vienna won the right of combination for working men, and trade-unions slowly developed. A law of 1883 greatly modified the code of 1859. In June, 1891, an interesting report on Austrian trade-unionism was read before the second conference of the Social Democratic Party. According to statistics furnished by the various associations, for which, however, only approximate accuracy could be claimed, it appeared that while the number of trade-unions and mutual improvement societies (*Bildungsvereine*) in Austria had more than doubled since the Hainfeld Conference of 1888, the number of members belonging to these societies had increased more than threefold during the same period. The report puts the total number of trade-unions at about 300, with a total membership of about 60,000. The report further stated that improved rates of wages, reduced hours of work, and the wider extension of labor agitation had proved that the trade-union organization had not been without effect. The publications of the Labor Press had also increased in number and importance, and their circulation had tripled or quadrupled. A resolution in favor of the support of the trade-union movement by the Social Democratic Party was unanimously adopted, and a proposal was made for the formation of special unions for working women.

According to the *Arbeiter Kalender* for 1893, there were in Austria 148 trade-unions and political associations, 143 benefit societies, 296 mutual improvement societies, 51 social unions, 37 provident and distributive societies. (This does not include Hungary.) The chief centers of Austrian trade-unionism are the industrial and populous districts of Lower Austria, Bohemia, and Moravia, while about a fifth of the total number of associations are established in Vienna. The highest organization is found in the printing trade and in the textile and metal industries.

Industrial arbitration has had considerable development in Austria. Industrial courts were established by the code of 1869 and committees of arbitration in 1888. Even compulsory arbitration has been advocated by the factory inspectors. In 1887 an act was passed compelling all employers to insure their employees against accidents. The country is divided into districts for this purpose, and in each district an association of 18 members, one third elected by employers, one third by employees, and one third nominated by the Government, controls the insurance.

Cooperation began in Austria from 1850 to 1860, but has not had great development. A union of cooperative societies was organized in Vienna in 1874, with 217 societies in 1892. The same year there were 2501 cooperative societies in Austria, of which 182 were loan societies and about 300 distributive. Post-office savings banks have had more development. The system was established in 1871 by Herr Schaffle, when Minister of Commerce, and by 1891 had 4767 banks, with 847,716 depositors.

The history of railroads in Austria is of interest, showing how she, a great conservative State, has been forced into the State railroad system almost against her will, and how it has prospered and recently become among the most progressive systems in Europe. We take the history of the early years as it is given in Professor Hadley's *Railroad Transportation*:

"When railroads were first invented Austria was the

home of bigoted conservatism. The Austrian Court and statesmen looked upon the new contrivance with a distrust, which was, from their point of view, well founded. Such rapid movement seemed to savor of dangerous radicalism, not to say revolution. The Emperor, in 1836, made up his mind to sign a railroad charter only on the somewhat dubious ground that 'the thing can't maintain itself, anyhow.'

"Railroads insisted on coming, whether monarchical governments liked them or not; and they did so much good when they came that the Government soon decided that they were a good thing, and gave them paternal assistance, either in the form of guaranty of interest or of direct State construction. This period in Austria lasted from about 1840 to 1848; it was a time of active railroad-building. The revolution of 1848 and the Hungarian war threw all industry into confusion. Under these circumstances Austria pursued exactly the opposite policy to that of Prussia. The Prussian Government tried to help railroads by buying them at low prices; the Austrian Government, by selling them at low prices. There can be little doubt that the Austrian Government during this period was greatly influenced by the example of France, and desired not to own its roads, but to have them owned and built by private companies, in systems radiating from Vienna, as the French lines radiated from Paris.

"The system was one which did not bear transplanting. It had grown up and had been found serviceable in France, because France was so closely knit together and centered around Paris so completely. In Austria it was quite different. The country consists of many distinct States, not even bound together by ties of language or of race. That Vienna is the seat of government for them all is scarcely more than a political accident. The conditions of trade are in many respects like those of the United States. They have their international cattle trade and grain trade; their combined rail and water routes on export business; their interstate commerce troubles and their granger troubles. They have a water route of dominant importance—the Danube, competing with their east and west trunk lines. With these and many other through-business complications, it is easy to see that the example of France could only prove misleading. They succeeded in appropriating some of its evil results, with none of its good ones. The State sold many lines in 1852 at about half their cost of construction. So far was this from stimulating the enterprise of private companies that, in 1859, some of the most important connecting links in Austria's trunk-line system were but half built. Her decisive defeat by France in that year was largely due to the unreadiness of her railroad system; and the same thing made itself felt to a less extent in the war with Prussia in 1866.

"The period of listlessness, which ended about the time of the war with Prussia, was followed by a period of wild speculation, which did not end until the crisis of 1873. In spite of stringent legal provisions the same abuses manifested themselves in Austria that had been found in other countries with fewer laws. Construction companies were numerous, and left such a bad name that to call a man 'a constructor' is, in Germany, far more opprobrious than to call him a liar. One example will suffice to show the recklessness, or rather light-headedness, of Austrian speculation at this time. It is all the more noticeable because Haberer, in his *Railroad History*, related it as if it were the most natural thing in the world.

"The crisis of 1873 brought to light a serious defect in Austrian law. While one concern after another went under, the holders of bonds or debentures were resting quietly in the belief that their interests were secured. But when one and another of these roads became unable to pay their interest, the matter was looked into thoroughly, and it was found that the whole debt was unsecured, for a lho there were nominal mortgages on the property, these mortgages had no legal authority, because they were not recorded in the manner prescribed by law.

"The prostration which followed the crisis of 1873 almost forced Austria into a policy of active State interference. This soon took the direction of extension of State ownership. In Hungary this policy had never been completely abandoned. In Austria itself it had been out of favor for twenty years; and this fact, combined with the not over-prosperous condition of the Austrian treasury, made it impossible to move rapidly. Three quarters of the lines are still in the hands of private companies; but matters unquestionably tend in the direction of State management." So writes Professor Hadley.

Since this time the policy of State management has progressed till now about three quarters of the lines

are in Government hands and return to the Government considerable revenue. The Hungarian roads have shown that State roads can be progressive by introducing the famous Zone system, for details of which see ZONE SYSTEM; also RAILROADS, section Austria.

Political economy to-day is strongly developed in Austria, and the new Austrian school is one of the most prominent in modern thought.

The new school was founded about 1871 by Carl Menger, Professor at the University of Vienna. To this school belong Eugen Böhm-Bawerk, formerly Professor at the Innsbruck University, now Chief of Department in the Austrian Ministry of Finance; also Professors Friedrich von Wieser and Emil Sax, both of Prague; Victor Mahaja, Chief of Department of Statistics of the Austrian Ministry of Commerce; also Professor Eugen von Philippovich, of the Vienna University. This school stands squarely against the classical, and is also the opponent of the historical school.

The Austrians lay much stress upon exact observation and exhaustive description of the facts of social life. Upon these they build their theories. They do not confuse the problems of political economy and psychology, yet they seek a more psychological basis than the English economists. Sax, in his work, *Die neuesten Fortschritte der nationalökonomischen Theorie*, defined political economy as adapted psychology. Böhm-Bawerk in Hildebrand-Conrads' *Jahrbücher für Nationalökonomie und Statistik*, 1890, expects that the new school will be called the "psychological school." In their method the Austrians meet, on one side, modern philosophy, and on the other modern natural science. Menger maintains the deductive method, and calls his work the "exact method." Böhm-Bawerk calls the method the "isolating one." Menger distinguishes three branches in political economy: the historic and statistic, which must examine and classify all economic acts of the individual and the State; the theoretic-political, which must reduce the same acts to general laws; the practical-political, which must define the rules for everybody's behavior. In this last group he puts social science and finance. The new school has found many disciples in the United States, England, Italy, France, the Netherlands, Denmark, and Sweden.

The works of Böhm-Bawerk (*q. v.*) upon capital are considered among the best treatments of that subject. For further information as to the Austrian school, see POLITICAL ECONOMY.

III. HUNGARY.

Abridged from the Report on Hungary of the (English) Royal Commission.

Altho there is not a labor question in Hungary in the sense that there is one in more highly developed industrial or manufacturing communities, a movement toward the improvement of the moral, political, and social conditions of the working people is certainly gaining ground. This movement is now finding striking expression, as it did a few years since in the counties of Békés and Csanád, in local outbreaks of violent agrarian socialism. Apart from these events, official reports relating to industrial centers would lead to the conclusion that such socialism as there is does not turn in the direction of communism, but is rather the expression of a national and political impulse.

Hungary has only recently entered into the field of manufacturing industry in the large sense. "The efforts of government and financial institutions to foster the growth of native industry have been determined and strenuous. The progress made has been extremely rapid. Factories are being built in considerable numbers; enterprises—commercial, mining, and manufacturing—are being promoted on every side; railway communication has been extended and improved; and, in short, Hungary has

**Political
Economy.**

set to work with the vigor and exuberant hopefulness of a young colony to further her material prosperity." In spite of all this it is true, and must be borne in mind, on the one hand, that in the strictly industrial sphere Hungary is still chiefly a country of small industries or handicrafts, while development of new and large industries is frequently hampered by a lack of skilled labor; and, on the other hand, that the economic strength, as well as the chief labor problems of Hungary, turn upon the natural agricultural and mineral resources of the country.

The industrial law of 1872 was the first law which quite ended the old guild system. It was "a complete victory for the extreme individualistic tendency, which worked out its influence several years later in Hungary as in the rest of Europe." The draft bill laid before Parliament contained a number of compulsory provisions of a socialist character, which were successfully combated and repelled by the liberal individualist party only, as events proved, to be partially embodied in the law of 1884 later on.

The change in the industrial law of Hungary, introduced by the law of 1884, it is stated by Dr. Mandello, "only affected the labor question in a secondary degree. It did not affect it in the first degree, because in the matters which directly relate to the workers only small alterations were made, and with the exception of the introduction of register of work these have not any great importance. But the indirect influence of the law was important, for it certainly strengthened the position of the employer of handicraftsmen, by the institution of industrial guilds, and consequently increased the dependence of the worker in this sphere."

The beginning of a socialist movement in Hungary can be traced back as far as 1867-68. After the agreement with Austria, which established a free administration in the country, it became possible for the working classes to develop and organize themselves, and an agrarian movement, mainly in the heart of the country

and the pest county, took place at about the same time. The movement, however, has been constantly subject to divisions and party strifes, which have prevented its development into a strong movement.

There are at least two socialist parties in Hungary, not to consider smaller differences. One of the chief subjects of division is, how far a socialist should sympathize with the national and race movements, and questions that play so large a part in Austrian politics. Nevertheless, in spite of division, socialism in Hungary has considerable strength. At a Socialist Congress in Budapest, January, 1893, there were 93 delegates, 33 of them from the provinces.

References: By far the best book on Austria and social reform is the *Foreign Report on Austria-Hungary of the (English) Royal Commission on Labor* (1894, price, 2s. 11d.). The best Austrian magazines and papers on social subjects are the *Statische Monatschrift* (the statistical monthly edited by the Imperial Statistical Office); the *Arbeiter Zeitung* (the weekly organ of the Austrian Social Democratic Party); the *Monatschrift für Christliche Social Reform* (the monthly organ of the Austrian Christian Socialists). See also Braun's *Sozialpolitisches Centralblatt* and Conrad's *Handwörterbuch der Staatswissenschaften*. The headquarters in Vienna for social reform literature is (1895) Brand's bookstore, 8 Gumpendorfer Street.

AVELING, EDWARD, was born November 29, 1851, of Irish parentage on both sides. He was educated at various schools and at University College, London, and went to Cambridge as Professor Michael Foster's assistant in physiology. He has been Professor of Chemistry and Physiology at New College, and of Comparative Anatomy at London Hospital. He was a member of London School Board, 1882. An avowed atheist, he is Vice-president of the National Secular Society, socialist lecturer, journalist, author, dramatist. His chief works are: *Student's Marx*; *Student's Darwin*; *Botany for Students*; *Geology for Students*; *Physics*; *Biology*; translations of Marx's *Kapital* (vol. i.); Engel's *Socialism*; Haeckel's *Pedigree of Man*; Titchomiroff's *Russia*. He married Eleanor, daughter of Karl Marx.

B

BAADER, FRANZ XAVIER (1765-1841), was born at Munich, March 27, 1765. His father was a medical practitioner, who was a friend of some of the liberal German bishops of that day, and shared their views. Young Baader declined to follow his father's profession, and adopted that of mining. At the University of Freiberg he was the friend of Alexander von Humboldt. He became interested in speculative philosophy, without, however, neglecting his profession of engineering, in which he greatly distinguished himself. In 1826 Baader was made Professor of Philosophy and Speculative Theology at Munich. In religious matters he desired the reunion of Protestantism and Catholicism, tho a good Catholic himself; and having uttered a remonstrance against the absolutism of the Roman court in 1838, he was deposed from his professorship. He gradually be-

came more and more interested in social subjects. He recommended a theocracy, a State held together by Christian love, which should be equally free from lawless individualism and from despotism. Kaufman in his *Christian Socialism* has summarized Baader's views as follows:

"Without previous and perfect union between God and man, social union can neither be effected nor maintained. Social coordination and subordination must rest on Divine authority. All members of the social organism are what they are by the grace of God. Physical force without spiritual power, compulsion without conviction, fear without respect, interest without love, cannot permanently secure social order.

"Corporate action and association are essential to the common weal, because they imply organized social life. On the other hand, all attacks on property by way of advocating a communistic redistribution is a crime against the common interests of all. The Christian law of mutual affection is the only safeguard against the disintegrating power of individualism.

With the development of the moral and religious life of the nation, social evolution will become possible also, and thus the unhealthy elements of social progress will be eliminated without the adoption of revolutionary measures. At present, he says, the majority of men are the slaves of capital, the production of wealth is carried on at a gigantic scale, while its distribution is alarmingly uneven and unjust. *The Church must provide a new diaconate* to bring about a more equitable redistribution. The most perfect corporation is the Catholic Church; it is, therefore, the best type of social organization. The Church is altogether opposed to the heathenish view of ownership of property, which is purely selfish, and therefore anti-social, separating private from common interests. The Church regards all men as agents and stewards of their possessions for the common good.¹

Baader was, however, not destined to make any attempt to carry out his views, as he died in 1841, only three years after losing his Munich professorship. The *Encyclopædia Britannica* says of him :

"Baader is, without doubt, the greatest speculative theologian of modern Catholicism, and his influence has extended itself even beyond the precincts of his own Church. The great work of Rothe, *Theologische Ethik*, is thoroughly impregnated with his spirit; and, not to mention others, J. Müller's *Christliche Lehre von der Sünde* and Martensen's *Christliche Dogmatik* show evident marks of his influence."

It is not strange that such a mind should have had great influence, and that Roman Catholic socialism, as in Bishop Ketteler (*q.v.*), should owe very much to Baader.

BABBAGE, CHARLES (1792-1871), studied at Trinity College, Cambridge; in 1816 he was made a Fellow of the Royal Society; in 1831 he helped found the British Association; in 1828 he became Professor of Mathematics at Cambridge, and devoted much time and money to the building of two great calculating machines. In political economy he has not contributed to economic theory, but by his full and faithful descriptions of characteristic economic phenomena he nevertheless has won a high place. Especially faithful and discerning were his analysis and portrayal of the benefits and effects of the division of labor. Political economy he was one of the first to declare not an exact science, like the mathematical, altho it did depend on "generals being much more frequently obeyed than violated." He was no blind worshiper of Mammon, and sneers at the notion that no calling is respectable which does not produce wealth. In the public interest he believed that inventors should be generously rewarded by the State.

His main works are: *On the Economy of Machinery and Manufactures* (1832); *Thoughts on the Principles of Taxation with Reference to a Property Tax and its Exceptions* [exemptions from it] (1848); *Observations on the Decline of Science in England* (1830); *A Comparative View of the Different Institutions for the Assurance of Life* (1826); *Essay on the General Principles which Regulate the Application of Machinery* (from *Encyclopædia Metropolitana*, 1829); *The Exposition of 1851, or Views of the Industry, the Science, and the Government of England* (1851); *Passages from the Life of a Philosopher* (1864).

BABEUF, FRANCOIS NOEL (1764-97), called *Caius Gracchus*, was born at Saint-Quentin. Left alone at the age of 16, his youth and whole life was stormy and wild. From the commence-

ment of the revolution he wrote violent articles, and was tried, but acquitted. He edited a paper which he called *Tribun de Peuple*. This took place after the fall of Robespierre. He gradually became more violent, and gathered round him a body of men whose main idea was to put down inequality of condition. "We desire," said they, "real equality or death." They met at the Pantheon (till their public meetings were broken up by Napoleon), and there counseled how to rouse the people to insurrection. They aimed at a real community of goods. The public authorities were to organize industry. Every one was to have a right to lodging, food, *mediocre mais frugale*, clothes, washing, warming, lighting, medical attendance. In May, 1796, they had planned a general uprising, but their plot was discovered a few hours before its execution, and Babeuf and Darthé were condemned to die February, 1797. They stabbed themselves before the tribunal, but life lingered on, and they were guillotined the next day. Babeuf's last words were said to have been: "I wrap myself in a virtuous slumber." His theory of communism was based largely on Morelly's *Code de la Nature*. According to it, "the aim of society is the happiness of all, and happiness consists in equality." "Let all the arts perish," cried its followers, "provided we obtain real equality." Government was to be absolute. No private individual was to be allowed to trade with foreign countries. Even within the country only such publications were to be allowed as taught the unqualified blessings of equality. All were to be dressed alike save for differences of age or sex. Children were to be removed from the family at an early age, to be taught of "civism" and communism. Comfortable mediocrity was the openly expressed ideal.

BACON, FRANCIS, VISCOUNT ST. ALBANS, was born at London, January 22, 1561. He was sent to the University of Cambridge at the age of 13. He entered diplomacy, and was one of the suite of the English ambassador at Paris. He studied law, became a Member of Parliament, Solicitor-General, Keeper of the Great Seal, and Lord Chancellor. He was made Baron Verulam, then Viscount. In 1621 he was convicted of corruption in office on his own confession. After this he devoted himself entirely to science and literature till his death in 1626.

Altho dishonorable in public life, Bacon's fame as a literary and scientific man is of the first order. His life was contemporary with the birth of modern science, and with it his name has always been associated. Altho he may not be the father of inductive philosophy—as he was for long considered—yet his scientific works were wonderful efforts of reasoning for a period when science was in its infancy. As a literary man Bacon always exhibits profound thought expressed in a remarkable and splendid style. There are few subjects with which he did not occupy himself. In his day economic questions did not form a separate study, nor were they of much account. Bacon, however, here and there touches on them, as in *Essay XXXIV., Of Riches*, and in the essay on *Plantations*. He discusses the government of colonies, and says: "Let there be freedom from custom till the plantation

be of strength, and not only freedom from custom, but freedom to carry their commodities where they may make their best of them, except there be some special cause of caution." In the *History of Henry VII.* and in other shorter works he shows himself a deep student of human and social philosophy. *The New Atlantis* is a brief Utopia, written between 1614 and 1617, and published after his death in 1627.

Bacon's chief works were his *Essays*, *The Advancement of Learning*, the *Novum Organum*, and the *History of the Reign of Henry VII.*

BAGEHOT, WALTER (1826-77), was born and died at Langport, Somersetshire. He was the son of a banker, and was educated at London University. Called to the bar, he chose to enter his father's bank. He first became known as a brilliant and buoyant literary critic and general writer. In 1858 he married the eldest daughter of James Wilson, editor of *The Economist*, and two years later succeeded to the editorship, continuing thus till his death. He was considered one of the best financiers of his day. His especial service in economics may be said to have been to have reconciled them with history. He had almost unbounded admiration for Ricardo, with whom as a successful man of business he had many points of agreement. "Adam Smith," he said, "discovered the country (of political economy), but Ricardo made the first map." He considered himself the last man of the ante-Mill period. Mill and Cairns had already shown that the old political economy was hypothetic, dealing not with real, but imaginary "economic men," who were simply conceived "as money-making animals." Bagehot showed that the world in which these men were supposed to act was a very limited and peculiar world. "What marks off this special world," he tells us, "is the promptness of the transfer of capital and labor from one employment to another." In history and life, as Bagehot showed, this is not the case. Bagehot therefore endeavored to confine the theoretical portion within its true bounds and to modify it by an appeal to the actual and the concrete. He named his great treatise *Lombard Street*, not *The Money Market*, because he desired to show that he dealt with the concrete and not the abstract. His sympathies were with the capitalists, the people "who spend their minds on little else than on thinking whether other people will pay their debts." Yet to the working classes and trade-unions he was never hostile. His only remedy was *laissez-faire*. As was natural from his position, his best detailed work was in elucidating the orthodox teaching concerning banking and finance.

His main writings are: *Letters on the Coup d'État of 1851*, written to the *Inquirer* (Unitarian organ), 1852, and reprinted in vol. i. of *Literary Studies*; *Parliamentary Reform*, reprinted, with additions, from the *National Review* (1858); *History of the Unreformed Parliament*; *Estimates of Some Englishmen and Scotchmen* (1858); many articles in the *Economist* (1860-77); *Physics and Politics*; or, *Thoughts on the Application of the Principles of Natural Selection and Inheritance to Political Society* (1872, International Scientific

Series); *Lombard Street: A Description of the Money Market* (1873); various articles in the *Fortnightly Review*—e.g., *Postulates of Political Economy* (February and May, 1876); *The English Constitution* (1867); *International Commerce: A Practical Plan for Assimilating the English and American Money as a Step toward a Universal Money* (1869; second edition, 1889); *On the Depreciation of Silver* (1877); *Literary Studies* (with a biography of the author), edited by R. H. Hutton, 2 vols., (1879); *Economic Studies* (1880); *Biographical Studies* (1881).

BAKOUNIN, MICHAEL (1814-76).—Bakounin, the father of revolutionary anarchist-communism, was born in Torschok, Russia, of aristocratic and even princely family. Educated for the military service, he became an artillery officer, and was stationed in Poland; but by 1835 became disgusted with Russian militarism, and went to Moscow to study philosophy, reading mainly Hegel and Schopenhauer, in company with Alexander Herzen, the later notorious Russian revolutionist, and others of similar type. In 1841 he went to Berlin and joined the Hegelians **A Communist.** there, becoming particularly acquainted with Arnold Ruge, and writing in his *Deutsche Jahrbücher*, at Dresden. He was led by Ruge to be a communist. In 1843 Bakounin went to Paris, and there made the acquaintance of Proudhon and his writings, and learned to give to his communistic views an anarchistic basis. Going for a while to Switzerland, he identified himself with every revolutionary movement—now advocating the cause of Poland, now declaring a revolutionary internationalism, then appearing and taking part in the Panslavist Congress at Prague in 1848. These inconsistencies won for him the nickname of "the mysterious Russian;" but he went on, consistently or inconsistently, identifying himself with every revolutionary movement. In 1849 he resided for a time in Leipsic, surrounding himself with Czech students, and endeavoring to provoke a fresh rising in Bohemia. When in that year the revolution broke out in Dresden, Bakounin joined it. He was, however, captured during a skirmish and condemned to death. On the eve of being shot he was handed over to the Austrian authorities, and tried by them for his part in the Czech rebellion. Again sentenced to death, he was claimed, this time by Russia, and handed over to her and imprisoned in the fortress of Schlüsselburg, and in 1852 transported to Siberia. These mysterious transfers were said to be on the ground of the *jus prima executionis*; but there were not lacking enemies who declared that he obtained his transfers by betraying his fellow-exiles. Be this as it may, in 1860 Bakounin reappeared in London, having escaped from Siberia by the way of Japan and the United States. He immediately resumed his advocacy of Panslavism, and became more revolutionary than ever. He wrote in Herzen's journal, *Kolokol* (*The Bell*), and exerted wide influence, among other ways, by his brochure, *Romanoff and Pugatcheff*. In 1863 he made his last efforts to aid a Polish insurrection. By

1864 he had renounced Panslavism and declared for revolutionary internationalism alone, and in 1865 went to Italy to organize the revolution there. When the International was formed in London in 1864 Bakounin

The International.

did not at first join it; but soon realizing its power, he threw himself into it and became the leader of its anarchist wing against Marx, the leader of the socialist wing. The names anarchist and socialist were not then used save in a vague way; both Marx and Bakounin called themselves communists, but gradually around these two leaders arose the two distinct movements which have since become the socialist and anarchist-communist movements existing to-day, and completely opposing each other in all European countries. The difference, however, only gradually asserted itself. The International at first was simply an effort to unite the workers of all countries. It stood in various countries for what the workmen of that country made it. In England it meant little more than international trade-unionism; in Germany it meant socialism; in the Latin countries it soon came to mean anarchist-communism. (See INTERNATIONAL.)

At a congress of a so-called peace league in 1867 in Geneva, Bakounin had favored the abolition of centralized States, and the substitution of voluntary federations of independent communes. At the next congress, in 1868, held at Berne, under the presidency of Victor Hugo, he urged joining the International. Failing to convince the assembly, he formed his supporters into a Social Democratic Alliance, the aim of which was to make land and capital the collective property of society, to be used only by agricultural and manufacturing associations. All existing States were to "disappear in the universal union of free associations." The Alliance desired to be recognized as part of the International, but its claim was rejected, whereupon it dissolved after six months' existence, during which it had been active in Spain and Italy, and its sections joined the International separately. At the beginning of 1869 the groups of the International in French-speaking Switzerland organized themselves as the Romance Federation. This speedily split into two sections, one of which, under James Guillaume, a disciple of Bakounin, became the Federation of the Jura. Its members called themselves Federationists, or Autonomists, and stood for Bakounin's extreme views.

On September 28, 1870, Bakounin organized an insurrection at Lyons, which failed. He had prepared the decree which was to pronounce the abolition of the State, but, as his opponent Marx said, two companies of *bourgeois* national guards were sufficient to send him flying to Geneva. In a pamphlet entitled

Letters to a Frenchman (September, 1870) he set forth the line of action that he wished to see adopted by the revolutionists in France, and which the revolution of March 18 was, in fact, about to follow to the letter. The principal points of this program are the following: "The insurgent capital forms itself into a commune. The federation of the barricades is maintained in permanence. The communal

council is formed of delegates, one for each barricade or ward, deputies who are responsible and always revocable. The council chooses from its members separate executive committees for each department of the revolutionary administrative of the commune. The capital declares that, all central government being abolished, it renounces the government of the provinces. It will invite the other communes, both urban and rural, to organize themselves 'revolutionarily,' and to send to a place to be named delegates, with imperative and revocable mandate, in order to establish the federation of the autonomous communes and to organize the revolutionary force necessary to triumph over the reaction. This organization is not limited to the insurgent country. Other provinces or countries may join in it. The communes which pronounce for the reaction shall be excluded from it."

Failing in France, Bakounin resorted to Italy. He had already in 1865 formed a group of active communists in Naples, and this became the Neapolitan group of the International.

In a letter written from Locarno on April 5, 1872, to Francesco Mora, at Madrid, Bakounin thus described the socialistic movement in Italy: "You are doubtless aware that the International and our dear Alliance have lately taken a great development in Italy. Hitherto it was not revolutionary instincts that were wanting, but organization and the revolutionary idea. Both are now established so thoroughly that, next to Spain, Italy is perhaps the most revolutionary country in the world. There is in Italy what is wanting elsewhere—a youth, ardent, energetic, without career, with no outlet, and which, in spite of their *bourgeois* origin, are not morally and intellectually worn out as in other countries. To-day they throw themselves headlong into revolutionary socialism, and our whole program, the program of the Alliance. Mazzini, our 'genial' and powerful antagonist, is dead and the Mazzinian party completely disorganized; while Garibaldi allows himself more and more to be drawn along by this youth of Italy, who bear his name indeed, but who go ahead infinitely faster and farther than he."

This same year, however, Bakounin was to make his break with the Marxian wing of the International. When the congress of the International was to be held in 1872, Marx succeeded in having it called at The Hague, where Bakounin could not come, since he would have been arrested in passing through either France or Germany. At the congress, therefore, Marx had it all his own way. The partisans of Bakounin were defeated, and the general council of the International was transferred to New York City, to remove it from the influence of Bakounin. The Federation of the Jura immediately raised the standard of revolt. They convoked at St. Imier a separatist congress, which declared that it refused to abide by the decisions of The Hague, and that it continued to consider Bakounin and Guillaume as members of the International.

In September, 1873, both the Marxists and the Autonomists held a congress at Geneva, each claiming to be the true International. The autonomists were the stronger. Bakounin appeared to have conquered. It was the last con-

gress of the Marxist International. The real triumph of Marxian socialism was not then apparent. Bakounin retired to Lugano, in Italy, but returned to Switzerland, and died in Berne July 1, 1876, Elisée Reclus, Paul Brousse, J. Guillaume, and others gathering round his grave, and uniting in October of the same year to carry on his work, organizing the cause to which Reclus later gave the name of anarchist-communism. (For the future history of that movement see ANARCHISM.)

Bakounin is said, by Reclus, to have been a man of great thought, strength of will, and untiring energy. By Felix Dubois he is described as a man of no original thought, hungry only for a notoriety to be obtained by any means. He was the embodiment of the revolutionist. He wrote of the International :

"It desires a universal revolution, at once social, philosophical, economical, and political, in order that the existing order of things—which is founded on property, on exploitation, on the principle of authority, whether religious, metaphysical, doctrinaire after the manner of the *bourgeoisie*, or revolutionary after the manner of the Jacobins—may be absolutely overthrown, so that not one stone of it shall remain upon another, first throughout Europe, and then in the rest of the world. Raising the cry of 'Peace for the workers! Liberty for the oppressed!' and 'Death to tyrants, exploiters, and patrons of all kinds!' we wish to destroy all States and all churches, with all their institutions and laws, religious, political, juridical, financial, magisterial, academical, economical, and social, in order that all these millions of poor human beings, who are cheated, enslaved, overworked, and exploited—having been at last delivered from their masters and benefactors, whether official or officious, whether associations or individuals—may henceforth and forever breathe in absolute freedom."

His ideal of the future was not formulated. He wrote :

"All reasonings about the future are criminal, because they hinder destruction pure and simple, and fetter the progress of the revolution. . . . The revolutionist is a man under a vow. He ought to have no personal interests, no business, no feelings, no property. He ought to be entirely absorbed in one single interest, one single thought, one single passion—the Revolution. . . .

The Revolutionist.

He has only one aim, one science—destruction. For that, and for nothing else, he studies mechanics, physics, chemistry, and sometimes medicine. With the same object, he observes men, characters, the situations, and all the conditions of the social order. He despises and detests existing morality. For him everything is moral that helps on the triumph of the Revolution, everything is immoral and criminal that hinders it. Between him and society there is war—war to the death, incessant, irreconcilable. He ought to be ready to die, to endure torture, and with his own hands to kill all who place obstacles in the way of the revolution. So much the worse for him if he has in this world any ties of relationship, of friendship, of love! He is no true revolutionist if these attachments stay his arm. Nevertheless, he must live in the midst of society, feigning to be what he is not. He must penetrate everywhere among the upper classes, as well as among the middle—into the merchant's shop, into the church, into the Government offices, into the army into the literary world, into the detective force, and even into the imperial palace. . . . He must prepare a list of those who are condemned to death, and dispatch them in the order of their relative misdoings. A new member can only be admitted into the association by a unanimous vote, and after his qualities have been proved, not by words merely, but by deeds. Each 'companion' should have under his control several revolutionists of the second or third degree, not wholly initiated. He should consider them as part of the revolutionary capital placed at his disposal, and he should expend them economically and so as to abstract the greatest possible profit out of them. . . . The most valuable element are women who are completely initiated, and who accept our whole program. Without their aid we can effect nothing."

Bakounin was not a voluminous writer. His best work is probably *God and the State*, which has been translated by B. R. Tucker (1883). His other writings were mainly attacks upon Marx and Mazzini, or violent *Bulletins of the Federation of the Jura*.

BALANCE OF TRADE, the difference between the amount or value of the commodities exported from and imported into a country. The balance is said to be favorable to a country when the value of its exports exceeds that of its imports, and unfavorable when it is *vice versa*. This is derived from the old idea long prevalent, but especially developed by the mercantilists (*q. v.*), that wealth consists only, or at least mainly, in money, and that therefore that country which exports more commodities than it imports must be rich, since it receives money to pay for the excess of its exports. Clement Armstrong, in his *Treatise Concerning the Staple and the Commodities of this Realme* (1530), says : "The holl welthe of the realme is for all our riche commodities to gete owt of all other realmes, therefore redy money; and after the money is brought into the holl realme, so shall all peple in the realme be made riche therwith." This was the universal theory in the middle ages, when there was what has been called a "balance of bargain" theory, each State striving on every bargain to obtain a balance of money. The first real refutation of the theory seems to have been by Nicholas Barbon in 1690, tho it remained largely accepted till the onslaught upon it by Hume in his *Essays* (1752), and the more calm and judicious analysis of Adam Smith. To-day, when it is seen that wealth may consist in many things besides money, the absurdity of the theory is apparent. Provided that one makes a favorable exchange, it matters little whether one pay in money or in commodities. Yet the theory, tho given up by all reputable economists, still occasionally appears in the utterances of so-called statesmen and the writers of editorials, from whom one would look for better things. This assertion of the absurdity of the theory must not, however, be taken to deny that under medieval conditions there was not a certain advantage in receiving money over other commodities, and that even to-day the same may hold for certain monetary reasons; but this is simply for monetary reasons, not for reasons of value of exchange or development of wealth. See Buckle's *History of Civilization in England*, vol. i., pp. 210-212; J. Janschull's *Englisch Free Trade* (Russian, 1 part, Moscow, 1876); E. von Heyking's *Zur Geschichte der Handelsbilanztheorie* (Berlin, 1882); W. Cunningham's *The Growth of English Industry and Commerce*, p. 362 (1885); C. F. Bastable's *The Theory of International Trade*, p. 164 (Dublin, 1887); G. Schanz's *Englische Handelspolitik* (1881).

BALL, JOHN (1338-81). The importance of John Ball's position in the annals of social reform comes from his connection with that movement which once and for a few moments only made the laboring class supreme in fourteenth century England. He was born probably about 1338, witnessed the Black Death while a scholar at

St. Mary's, York, and was ordained to the priesthood not long after 1356, becoming one of the class of parochial chaplains, who corresponded among the clergy to the artisan class among the laity. It was toward the end of the long reign of Edward III. and about seven years before Wycliffe raised his voice at Oxford that the "mad priest," as it suited the land-owners to call him, began to prophesy against the evils of his time; and, as John Richard Green has said, "in the preaching of John Ball England first listened to the knell of feudalism and the declaration of the rights of man." And England was ripe for the message. Since the troublous times under Stephen, nearly two centuries before, the land had enjoyed a steady growth of material prosperity, towns had increased in size, guilds of artisans, regulating their own affairs, had grown up, and the class of "free laborers" which had come into being was the thin end of the wedge which was to destroy villeinage. These changes received an impetus first from the famine of 1315-16, and again from the Black Death in 1348, during which crises the poor suffered such hardship that their numbers were greatly thinned, and their services became more valuable in proportion to their scarcity. The landlords and wealthier craftsmen of the towns resisted this rise of wages, and consequently provoked the first quite clearly marked conflict between capital and labor in the annals of English history. At first by royal proclamation, and subsequently by the repeated enactments with added penalties of the famous "Statute of Laborers," every effort was made to defeat the rising prosperity of the artisans and peasants. The scarcity of workers also led to attempts, on the part of the nobles and lawyers, to reduce to serfdom again those who had, in one way or another, attained their freedom. All this of course tended to raise bitter class feeling and active resistance. Successful revolutions are seldom the work of starving men; for empty stomachs are not conducive to the clearness of vision necessary to plan and carry out such movements. The years of prosperity following the Plague of 1348 had done more to open the eyes of the peasants than all the centuries of poor rations which had gone before. The spirit of independence had gone abroad, and every resistance only fanned its flame.

Such were the conditions amid which Ball began his life-work, and for 20 years preached a Lollardry of a coarser and more popular sort than that of Wycliffe. He traveled from place to place, and preached in churchyards and from the market

His Life.

crosses to crowds, which were ever increasing as he incurred the greater displeasure of the authorities. He insisted on the necessity of marriage, on a voluntary priesthood, on the injustice of demanding tithes from poor men; and he particularly denounced those who were trying to force the villeins back into their condition before the Black Death. He was accused before the authorities of manifold errors, and of stirring up strife, and was rebuked by Islip, the Archbishop of Canterbury, and excommunicated, while working in his diocese, by the Bishop of Norwich. From the headquarters which he maintained in Essex his work

extended in all directions, and he gradually became the recognized head of an ever-growing labor party, whose sections in the different parts of the country were united by a great band of itinerant priests, whose office enabled them to travel unsuspected in every direction. While all this was going on events were rapidly preparing the way for insurrection. The peasants were filled with what Professor Rogers calls a "religious socialism." The actual outbreak was delayed by several causes, for the leaders were loth to provoke an appeal to arms, tho as early as 1375 they seem to have decided that it would ultimately be necessary. Between 1375 and 1377 riots were frequent, and the people were held back with great difficulty. Then Edward III. died, and the hopes of the popular party for a better state of things were revived for a short time, while the troubles with the French helped to distract attention from the troubles at home. But when defeat abroad added to misery at home was capped by a fresh tax levy, to which the poor were compelled to contribute as much as the rich, the suffering became unbearable. In the early part of 1381 Ball began sending letters to his party everywhere, saying that the time for action had come. In April he was imprisoned, first in Maidstone jail and then in the Archbishop's palace at Canterbury; but his plans were too well laid to be so frustrated, and in June the storm burst. The people rose simultaneously in all parts of the country. Canterbury, where "the whole town was of their sort,"

Wat Tyler's Rebellion.

was thrown open to the insurgents, who plundered the Archbishop's palace and released Ball, who thenceforth became the heart of the movement, as Wat Tyler was its military head. Then they moved on London, occupied Blackheath and Southwark, and sent their demands to the king, at the same time crossing the Bridge and burning the new palace of the hated John of Gaunt and the hospital of St. John. The best of order and discipline were maintained; gold and silver vessels they smashed with axes, jewels they brayed; they stole nothing. This was on June 11-13. On the 14th the insurgents insisted on a conference with the king, and he came forth from the Tower, and met them almost alone at Mile End, giving assent to their demand: "We will that you make us free forever, ourselves, our heirs, and our lands; and that we be no more bond, or so reputed." He set clerks at work writing charters of manumission, and giving these to them, he bade them go home at once, which many did, thus weakening their strength through division. On the 15th, while Tyler was conferring with the king alone, and under the protection of a safe-conduct, he was murdered by Walworth, the mayor, and the rebels, having lost their chief and leader, fell into the stratagem of the king, who put himself at their head and persuaded them to leave London altogether. Ball seems to have made an unsuccessful attempt to rally the peasants again; but, being caught at Coventry, was hung, drawn, and quartered, after the fashion of the time. "The peasants were dispersed and defeated," says Professor Rogers; "their leaders were tried, sentenced, and hanged; but the solid

fruits of victory rested with the insurgents of June, 1381. Once in the history of England only—once, perhaps, only in the history of the world—peasants and artisans attempted to effect a revolution by force. They nearly succeeded—at least they became for a short time the masters of the situation. That they would have held the advantages they gained at Mile End, had they provided against the tragedy of Smithfield, is improbable. But they caused such terror by what they actually did that they gained all they claimed, and that speedily. The English laborer, for a century or more, became virtually free and constantly prosperous."

BALLOU, ADIN (1803-90), was born in Cumberland, R. I. His family was of Norman-French origin. His ancestor, Maturin Ballou, in 1646 aided in founding the city of Providence, R. I. Adin Ballou's parents were Ariel and Edilda, formerly Tower. In 1822 he married Abigail Sayles, who died February, 1829. On March 3, 1830, he married Lucy Hunt.

At 11 years of age Adin Ballou felt a fervor of the Divine spirit, and year by year it developed, and at 18 he preached his first discourse. He became a Universalist, and was listened to with the closest attention. He published many books and pamphlets, and edited many papers on mainly reformatory subjects. In 1841 he was the founder of the Hopedale Community (*q. v.*), in Massachusetts, which, as long as it remained under the management of Mr. Ballou, succeeded in doing the good it started out to accomplish. He did remain at its head for over 10 years, but was finally superseded by an intriguing business man, who got the lead and ruined the community. Mr. Ballou, however, lived on in quiet life until 1890. (For his views, see HOPEDALE.)

"**BALTIMORE PLAN,**" **THE.**—The proposed currency reform known as the "Baltimore plan" received its name from having been proposed at the annual convention of the American Association of Bankers on October 11, 1894, by the Clearing House Association of Baltimore, as a body representing the banking interests of that city.

The "Baltimore plan" is briefly outlined as follows by the editor of the *Engineering Magazine* in an introductory paragraph to two addresses delivered before the convention, which he publishes: "It provides that bond security for national bank-notes shall be abolished; that the banks shall be permitted to issue circulating notes up to 50 per cent. of their paid-up capital (and under emergency conditions an additional 25 per cent. may be named); that the notes of failed banks are to be paid out of a 'Guarantee Fund,' created by an annual tax on all national bank-notes sufficient to cover such failures; that the Government shall have a prior lien upon the assets of each failed bank and upon the liabili-

ties of shareholders, for the purpose of restoring the amount withdrawn from the 'Guarantee Fund' for the redemption of its circulation; and otherwise that the redemption of all national bank-notes and the close scrutiny of all national banking affairs shall be carried on by the Government as at present." It will be seen that practically the only change proposed is the substitution of a guarantee fund for Government bonds as security. From this fund, which, as is specified in the plan, shall be equal to 5 per cent. of the outstanding circulation, the Government is to redeem notes of failed banks. (See BANKS AND BANKING.)

BANDS OF HOPE.—Temperance organizations for juveniles, established in great numbers throughout all the English-speaking countries, frequently as departments of church and Sunday-school work. In the United States the name "Band of Hope" has been generally changed to "Loyal Temperance Legion," although some local organizations are continued under the old name. The Band of Hope pledge in this country is as follows:

"I hereby solemnly pledge myself to abstain from the use of all intoxicating drinks, including wine, beer, and cider, as a beverage; from the use of tobacco in every form, and from all profanity."

Concerning the Bands of Hope of the United Kingdom, the editorial secretary gives the following information in the *Cyclopedia of Temperance and Prohibition*:

"The first society called a Band of Hope was formed in England in October, 1847. Temperance societies for children and young people, on a distinctly total abstinence basis, had existed, however, many years earlier, both in the British Isles and the United States. The origin of the first Band of Hope must be jointly attributed to the efforts of Mrs. Carlile, of Dublin, and the Rev. Jabez Tunnickliff, a Baptist minister of Leeds. In August, 1847, Mrs. Carlile visited Leeds to address children in Sunday and day-schools on the subject of temperance. Mr. Tunnickliff, who had occasionally accompanied Mrs. Carlile in her visits to the schools, felt convinced that unless something was done to follow up her labor it would be largely lost. Accordingly, before Mrs. Carlile left Leeds, a meeting was called, an organization was formed, a name was adopted, and a committee was appointed to perfect the plan. The first Band of Hope meeting was held late in October, when about 300 children sat down to tea, more than 200 of them taking the following pledge:

"I promise to abstain from all intoxicating drinks as beverages."

"The movement spread nowhere with greater success than in the county of its birth, where at the present time there are probably over 2000 juvenile temperance societies of one kind or other. In 1851 the first Band of Hope Union was formed. A Union for London was established in 1855, which in 1864 became the 'United Kingdom Band of Hope Union.' County unions rapidly followed, and now cover the greater part of England. The United Kingdom Band of Hope Union, with which the various organizations are associated, aims at furthering the interests of the whole movement throughout the country. It assists local unions and societies by means of its lecturers and deputations, by public meetings, conferences, missionary efforts, literature, correspondence, and advice. Its sphere of work is in Bands of Hope, Sunday-schools, day-schools, colleges, orphan asylums, industrial and district schools, training ships, reformatories, and the homes of the children. Its latest and most important effort is the 'school scheme,' by which, through the kindness of munificent friends, the committee is enabled to devote £2000 per annum for the next five years to the delivery of scientific lectures and addresses in day-schools, and to other important educational work."

The latest estimate of the strength of the movement, compiled from the best available

data, shows that there are nearly 15,000 Bands of Hope and juvenile temperance organizations in England, Scotland, Wales, and Ireland, with upward of 1,800,000 members.

BANK OF AMSTERDAM, THE, was founded in 1609, and was long the great warehouse for coin and bullion in Europe. It was at first simply the custodian of the coin and bullion deposited in it, for which it gave receipts which could be transferred from hand to hand. Later, the bank began the practice of making advances upon deposits, or giving credit upon its books, usually to the amount of about 5 per cent. below the mint price of the bullion deposited. This practice eventually occasioned its ruin, because the bank made large advances to the Dutch East India Company and certain provinces in Holland, and during the French occupation of the last part of the last century it was found insolvent. The city of Amsterdam finally paid off those who had the paper of the bank; but though effort was made to revive it, it closed in 1820. Adam Smith gives a full account of the Bank of Amsterdam. He says (*Wealth of Nations*, Book iv., chap. iii.): "Before 1609 the great quantity of clipped and worn foreign coin which the extensive trade of Amsterdam brought from all parts of Europe reduced the value of its currency about 9 per cent. below that of good money fresh from the mint. Such money no sooner appeared than it was melted down or carried away, as it always is in such circumstances. The merchants, with plenty of currency, could not always find a sufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of general regulations which were made to prevent it, became in a great measure uncertain.

"In order to remedy these inconveniences, a bank was established in 1609 under the guaranty of the city. This bank received both foreign coin and the light and worn coin of the country at its real intrinsic value in the good standard money of the country, deducting only so much as was necessary for defraying the expense of coinage and the other necessary expense of management. For the value which remained, after this small deduction was made, it gave a credit in its books. This credit was called bank money, which, as it represented money exactly according to the standard of the mint, was always of the same real value and intrinsically worth more than current money. It was at the same time enacted that all bills drawn upon or negotiated at Amsterdam of the value of 600 guilders and upward should be paid in bank money, which at once took away all uncertainty in the value of those bills. . . . These deposits of coin, or those deposits which the bank was bound to restore in coin, constituted the original capital of the bank. . . . At present they are supposed to constitute but a very small part of it. In order to facilitate the trade in bullion, the bank has been for these many years in practice of giving credit on its books upon deposits of gold and silver bullion."

BANK OF ENGLAND, THE, was established in 1694 by act of Parliament (William and Mary, V. c. 20), having been projected by Will-

iam Paterson, a Scotchman, then resident in London, who had carried on a business with America. Its establishment grew out of the Government's need of money. Certain subscribers were ready to loan the Government £1,200,000, and to do this were incorporated for 11 years as the Governor and Company of the Bank of England, and received 8 per cent. on the loan besides £4000 a year for the expenses of management. The bank was authorized to issue notes, to make advances on merchandise, to deal in bills and bullion, and to own property in any form. It was only to deal in bills and bullion. In 1696 the bank was compelled temporarily to suspend payments, but recovered, and in 1697 was allowed to enlarge its capital by £1,001,171, and to double this in 1708. Its charter has been continually renewed by various acts of 1697, 1708, 1713, 1742, 1764, 1781, 1800, 1833, 1844, 1861. In 1708 it was given many exclusive privileges, so that no other joint stock bank was founded in England till after the legislation of 1826. The bank suffered severely from a panic in 1745. Its capital has seldom differed materially from its permanent advance to the public.

The main event in the history of the Bank of England till the enactment of the Bank Act was its suspension of specie payments from 1797-1821. This portion of its history we abridge from Professor Syme's *Political Economy*:

History.

In 1796 England had been for three years engaged in a great war with France. The fear of an invasion had just caused a run on many country banks. These had withdrawn their reserves from the Bank of England, and in 1797 the spare reserve in that institution sank to about £1,000,000. The Government intervened, and an act of Parliament was speedily passed which forbade the bank from paying in specie except in certain specified cases. This of course made the Bank of England notes inconvertible. But the firmness and prudence of those at whose discretion these notes could be issued kept the paper up to its full nominal value in gold for 11 years (1797-1808). Then a depreciation began, and by the year 1814 the price of gold (in notes) increased from £3 17s. 10½d. to £5 4s. per oz. The close of the war led at once to a fall in the premium on gold; in fact, the premium began to fall as soon as a speedy termination of the war became pretty certain. A bill was passed requiring that all notes should be convertible at full nominal value from May 1, 1823. As a matter of fact, the bank had returned to full specie payment over a year before this.

The Bank Charter Act of 1844 was introduced by Sir Robert Peel. Its fundamental object was to limit the power of banks to issue notes. By it the Bank of England was only allowed to have £14,000,000 worth of notes in circulation, in addition to its actual gold reserve; but when any other bank, having the power to issue notes, ceased to exist, the Bank of England was to be allowed to increase its note circulation by not more than two thirds of what the dead bank had been allowed to circulate. Other London banks and all banks started after the passing of the act were prohibited from issuing notes.

Those provincial banks which existed when the act was passed were allowed to continue issuing up to what had been their ordinary outstanding note circulation. The

Bank Charter Act of 1844. Scotch and Irish banks were further allowed an additional note circulation equivalent to the amount of specie they held.

Under the provisions of this act the total note circulation of the United Kingdom is now limited to about £31,000,000 in addition to the actual reserves in the Bank of England and the Scotch and Irish banks. In 1845 came the failure of the Irish potato crop. It was some time before the effect began to be felt. But by the January of 1847 the bullion in the Bank of England had sunk below £14,000,000, as against over £16,000,000 in the August of 1846. The bank now raised its rate from 3 to 3½ per cent., and then, finding the drain on its reserves continued, there was a further raising to 4 per cent. Nevertheless, by April the reserve was below £10,000,000.

The rate was again raised, this time to 5 per cent. Meanwhile, in 1846 there was a second failure of the potato crop; and in most parts of Europe the harvest was bad. Agricultural prices were higher than they had been for 34 years. There was consequently much speculation in corn, which temporarily inflated credit. But the large importations forced on a heavy fall in the price of wheat, which ruined many of the speculators. On August 9, Leslie, Alexander & Co. failed with liabilities of about £500,000. On the 11th a couple of other firms failed, each with liabilities of about £200,000. Others quickly followed. Within three weeks there were failures to the amount of over £3,000,000 in the corn trade. By the middle of September the ruin had begun to extend to other trades. The extent to which capital had been locked up in railways intensified the evil. The bank not only raised its rate to 5½ per cent., but refused to lend on what would ordinarily have been regarded as good security. Toward the end of October banks began to fail. On October 18 the Royal Bank of Liverpool had to close its doors. This brought down two other Liverpool banks. In Newcastle, in Manchester, and in other West of England places bank failures occurred. Consternation spread through the mercantile world. At length the Bank Act was suspended, and the mere knowledge that the Bank of England was free to issue notes at its discretion sufficed to stop the panic. The bank rate was now 8 per cent.; but the bank lent freely, at high rates when the security was good, and so saved a number of firms that would otherwise have fallen.

In 1857 there was another panic. Trade had been overstimulated by the Crimean War and railway building, especially in America. In New York City 62 banks out of 63 stopped payment. Many English houses failed. The scenes of 1847 were repeated on a worse scale. The balance

in the Bank of England sank below £500,000. The bank rate rose to 10 per cent. But for the suspension of the Act of 1844 the Bank of England must have closed its doors on November 13, 1857. The suspension of the act was once more followed by a

cessation of the panic, but not till notes had been issued considerably in excess of what had been the limit under the act. Then the cycle began again. A period of stagnation was again followed by a period of revival, which developed into one of overspeculation, till the crash of 1866, since when there has been no suspension of the Bank Act.

It is asserted by believers in a paper currency that the Bank of England has suspended 52 times, and only been saved by reverting to paper. On the other hand, it is denied that it has suspended since 1832, and it is claimed that only the Bank Act has been suspended. Professor William Sumner, in a note to his *History of American Currency*, p. 137, explains that the run on the bank in a panic is not for gold, but for notes—*i.e.*, for discounts. If, however, there is an export of gold at the time, the notes are taken to the issue department and gold demanded. According to the charter, the bank can circulate only \$15,000,000 in notes on government security, and for all other notes it must have gold, sovereign for sovereign. If, therefore, there is a drain on its bullion, it must contract or keep all notes handed in for gold. This heightens the panic. The action of the Government is to allow the bank to disregard the clause governing circulation. It promises to ask Parliament for indemnity. The bank then discounts freely for solvent parties, but at high rates. This always kills the panic as panic.

By the act or charter of 1844 the bank was divided into two departments, the *issue* and the *banking*. The sole business of the *issue* department of the Bank of England is to give out notes to the public. Before the separation of the departments the Government owed the bank **Method of Working.** £11,015,100. This sum was declared to be now due to the *issue* department, and for the issues of notes to that amount it need hold no gold. This was the same as if the bank had originally lent £11,015,100 of its notes to government, and these notes had gone into circulation. The bank was also allowed to issue additional notes on securities—the limit at present amounting to £3,984,900, and this also without holding gold. The amount of notes which may thus be issued, without gold being in reserve against it, is £15,000,000. All notes above that amount can be issued only in exchange for gold. When the act was passed in 1844, the limit of notes to be issued against the Government debt and securities was fixed at £14,000,000, for experience indicated that there would always be at least that amount of notes of the bank circulating among the people. The addition of the £1,000,000 is an extra issue, authorized by an act, in consequence of certain banks of issue having since given up that function. The bank has to account to the Government for the net profit of this issue loan of notes of £1,000,000, and the profit the bank derives from its *issue* department is the interest received on the £14,000,000 of Government debt and securities, which, at 3 per cent., is £420 yearly. But out of this the bank pays to the Government, for its banking privileges, and in lieu of stamp duties, £180,000. If the expense of the *issue* department is £160,000, the net profit upon it

would be £80,000. The bank also makes a profit upon bullion and foreign coin. These are brought to the bank for notes; they are worth £3 17s. 10½d. per oz.; but the bank is obliged by its charter to purchase them at £3 17s. 9d. The holders prefer this to having their bullion and foreign coin coined, free of charge, at the public mint, as the delay in the coining is equal to a loss of interest of 1½d. per oz. The average amount of notes in the hands of the public is about £25,000,000; but the amount issued by the *issue* department is greater. The difference is the amount lying in the *banking* department, and represents the reserve of gold of that department—that is to say, the *banking* department retains only £500,000 or £750,000 of coin, and transfers the bulk of its reserve to the *issue* department in exchange for notes. We must, therefore, regard the reserve of the *banking* department as gold, though in the shape of notes issued by the other department.

Viewed in its *banking* department, the bank differs from other banks in having the management of the public debt, and paying the dividends on it; in holding the deposits belonging to the Government, and making advances to it when necessary; in aiding in the collection of the public revenue, and in being the bank of other banks; above all, its issues are the only ones that are legal tender. For the management of the public debt the bank receives about £247,000, against which there has to be set £124,000 of charges. The remaining profits of the bank are derived from its use of its deposits, on which it allows no interest, and of its own capital. The capital was originally £1,200,000; in 1826 it reached £14,553,000. There is besides a remainder of about £3,500,000. The bank is situated in the center of London, but has branches in the city and provinces. Its constitution is very simple. It has a governor, deputy governor, and 24 directors, mainly chosen from firms engaged in negotiating foreign and other loans. The directors are practically self-elected.

BANK OF FRANCE, THE, the most important banking institution in that country, was founded in 1800 as a private company, and made practically a State bank, through the law of 24 Germinal An. xi. of the First Republic (April 14, 1803). A law of April 22, 1806, placed it on its existing footing. Its original capital of 45,000,000 frs. was raised to 90,000,000 frs. divided into 90,000 shares, and has been increased since. Its governor is appointed by the State; its council are elected by the 200 largest stockholders. The bank has now 94 branches (*succursales*) in France.

Through the *Bureau de Virements* it performs the functions of the clearing house, and it facilitates the transmission of money between the towns in which the branches are situated and the head office.

The Bank of France can pay its obligations either in gold or silver of legal tender—*i.e.*, in silver pieces of five frs. It is claimed that this tends to maintain a comparatively even rate of

discount, even in the foreign exchanges, favorable to the export of gold. The number of changes since 1844 has been less than either with the Bank of England or of Germany. Concerning the interesting and instructive experience of the Bank of France during the Franco-Prussian War, Mr. L. H. Courtney writes in the *Encyclopedia Britannica*:

“The war of 1870-71 could not but have an important influence on the operations of the bank. Successive governments resorted to it for assistance, which was obtained by increasing the issue of its notes and by giving them a forced currency. The rate of interest, which had been 2½ per cent. from May, 1867, rapidly rose to 6 and 6½, at which it remained with scarcely any variation from August 9, 1870, till late in the year 1872. The rate would probably have risen much higher, but on August 13 a law was approved suspending the liability of the acceptors of bills current to meet them at maturity, and this suspension was renewed until it was finally withdrawn in July, 1871. The amount of unpaid bills held by the bank reached a maximum of 368,000,000 frs., but the ultimate loss was extremely small. On June 23, 1870, the metallic reserve at the bank was 1318¼ millions of frs., which was reduced to a minimum of 505,000,000 on December 24 of the same year. The notes in circulation before the war had been about 1,400,000,000 frs.; but before the end of the year 1870 their volume had increased to 1,700,000,000; and this again rose to 2,000,000,000 before July, 1871, and to 2,400,000,000 before the end of 1871. A law of December 29, 1871, fixed the maximum at 2,800,000,000, which was finally raised on July 15, 1872, to a maximum of 3,200,000,000. The debt of the State to the bank increased concurrently with this increase of issues, which was, indeed, authorized for the purpose of enabling the bank to assist the treasury. On December 26, 1870, the bank held treasury ‘bons’ to the extent of 174,800,000 frs. only, but on November 20, 1871, it held 1,103,600,000 of these ‘bons,’ and in August, 1872, the amount reached 1,263,100,000 frs. A law of June 21, 1871, followed by an agreement between the bank and the Government, provided for the repayment of this debt in annual payments of 200,000,000, but up to this time (August, 1875) the income of the State has never been large enough to provide the whole of this sinking fund. The bank has, however, been able to increase its metallic reserve through the liquidation of securities and the accumulation of deposits; so that, after having been reduced, as we have said, to 505,000,000 in December, 1870, and not attaining to more than 634,000,000 in December, 1871, it rose in the same month of 1872 to 793,000,000, in 1873 to 820,000,000, and in 1874 to 1,331,000,000, or just the amount at which it stood before the declaration of war. Its volume has, however, continued to increase, and on March 25 of this year (1875) it stood at 1,528,000,000; and the forced currency of the notes of the bank might be at any time withdrawn. It must be admitted that the management of the bank throughout these years of difficulty has been eminently prudent and successful.”

BANK OF GENOA, THE, was organized in the form in which it is generally known, in 1407. Like the Bank of Venice, it was a bank principally of deposit and circulation. It was the financial center of the Genoese republic, and in it all the transactions in the public funds were carried on. Anderson says (*Origin of Commerce*, vol. 1. p. 319) that in 1345 the republic of Genoa had “run so considerably into debt to her own citizens that in this year four of them were elected to make provision for those debts, and for the current service of the year.” They were so successful that, according to the same author, “managing their stock prudently, and having many rich men concerned with them, they afterward supplied the further necessities of the republic; and for that end had at length most of the cities and territories of Genoa pawned, or, rather, sold to them;” . . .

Franco-Prussian War.

and (p. 414): "In proportion as the wants of the republic increased, so did the credit of this house or bank, by having still more bonds, rents, and important dominions assigned to it." In Michelet's phrase, Genoa was almost a bank before a city, and the name of the bank of St. George known through all Europe. The bank finally lost its credit through the Austrian occupation of 1740 and the French of 1800, both occupants appropriating its property.

BANK OF GERMANY, THE IMPERIAL.—Altho this bank does not occupy to other German banks so high a position as the national banks of other countries, it is still high. The present constitution of the Bank of Germany was fixed by the Bank Act of 1875, when the Bank of Prussia was merged in the Imperial Bank. In 1890 it had 243 offices in close working with the government. "The Bank of Germany," says Professor Dunbar, "is permitted to add to its circulation against securities the issue of any other issuing bank whose circulation drops. It is likewise permitted to exceed the legal limit, called in Germany the Reserve of Notes Tax, free, on payment of a fine of 5 per cent. per annum on the total excess issue. This had occurred three times during the first ten years since the passing of the act in 1875, and on none of these occasions was the rate of discount raised during the period of excess issue, nor was any extra pressure felt during the time. To those conversant with the effect experienced when the Bank Act of 1844 has had to be suspended in England, the smoothness with which this arrangement acts will be a matter of interest. The automatic operation of the German Bank Act certainly works well in that country, and though the different circumstances of business there do not admit of an exact comparison with England, the question deserves more attention than has been given it. The Bank of Germany is, even more distinctly than the Bank of France, essentially a 'State bank.' The distribution of the profits (law of December 18, 1889) is as follows: $3\frac{1}{2}$ per cent. to the shareholders, then 20 per cent. of the balance to reserve, till it reaches one fourth of the capital; of the remainder half to the State and half to the shareholders, till they have received six per cent. If there is any further surplus, three quarters goes to the State and one quarter to the shareholders. The first $3\frac{1}{2}$ per cent., if need be, may be made up from the reserve. The German emperor appoints the president and council of the bank directory, whose office is for life, on the recommendation of the federal council. The government also, through the chancellor of the empire, exercises other powers of control, and has the right to end the existence of the bank, or to acquire its capital at its full value at the end of every ten years, commencing 1891. The shareholders influence the management through a committee. As in the case of the Bank of France, the arrangements as to rates of interest are uniform over the whole field of operation, and the facilities given by this, and by the action of the bank in the discount of commercial paper, as well as by the transmission of cash, etc., have given a great impetus to the prosperity of the empire. There are many

other banks in Germany besides the Imperial Bank, some of which issue notes. This privilege has, however, been relinquished to a considerable extent, owing to the restrictions imposed on all banks of issue."

BANK OF HAMBURG, THE, was founded in 1619 on the model of that of Amsterdam (*q.v.*). It carried on its business under the protection of the city, and was one of the main causes of the great commercial prosperity of Hamburg, in its leadership of the Hanseatic League. It was a place of deposit for the precious metals, principally uncoined silver. Adam Smith says that its agio was about 14 per cent. It continued to flourish down to 1875, when it became a department of the Bank of Germany (*q.v.*).

BANK OF VENICE, THE.—Concerning the origin of this famous bank, which has played such an important part in monetary discussion, authorities are disagreed, altho their disagreement depends mainly upon the use they give to words. According to some, the Bank of Venice dates from 1171, and according to others, from 1619. This is because the latter authorities deny that up to 1619 it was a bank in any modern or correct sense of the word. Nevertheless, whether a bank or not, it seems clear that in 1171 the republic of Venice, in need of funds, in connection with the Crusades, made a forced loan, and that an office or chamber for the loan was created, the contributors to the loan receiving interest. The bank, if bank this was, had no capital, and was simply a bank of deposit. Other such loans were made in 1480, 1510, and at other times. The contributors to the loan, and, later, other contributors, were given credit at the bank, and their deposits could be transferred at their pleasure on the books of the bank. In the great confusion and complexity of the coins of all nations circulating in Venice, owing to its large commerce, these bank credits, transferred on the books of the bank, came to be preferred to coin. They were received as money by the public treasury, and after 1423 it was decreed that all bills of exchange payable in Venice, whether domestic or foreign, should be paid unless otherwise expressed in the bank. In 1619 it was changed into the Banco del Giro, long known as the Bank of Venice, which date some authorities give as that of the real foundation of the bank. The history of the Bank of Venice has been written by Stephen Colwell in his *Ways and Means of Payment*, and from this book believers in fiat money have drawn a strong argument in support of their views, altho these conclusions are severely criticised by their opponents. Thus, Mr. B. S. Heath, in his *Labor and Finance Revolution*, says (p. 101):

"Stephen Colwell's digest of 14 authorities leads to the following deductions, as will be seen by perusal of his able work:

"1. It proves that there was a national bank of Venice founded on a loan of 2,000,000 ducats spent by the State in 1171, and the bank existed within the memory of living men, a period of 626 years, during which time it was gradually enlarged over 700 per cent.

"2. That A.D. 1423 it was modified by law to prevent fluctuation.

"3. That the 4 per cent. interest previously paid was abolished.

"4. That all promise of reimbursement, other than transfer of credit receipts, was abolished.

"5. That the nation 'took the coin of its loans one time for all' in the nation's bank, giving a credit receipt only.

"6. That no coin was kept as a specie basis of credit, or for strengthening the nation. They were immediately paid out.

"7. That no promise to pay any coin was made after 1423, for nearly 400 years of its continuance.

"8. That this 'fiat' or legal credit was that in which all coins were expressed—the fixed standard of payment—and thus the principal money of account; specie being for retail coin or export commodity and legal tender at 20 per cent. discount.

"9. That the premium fixed by law of 20 per cent. premium over the Venetian gold ducat, so celebrated for its fineness in export, was a real superiority of legal money of account over the commodity gold, and over gold currency.

"10. That it was not dependent on any promise of convertibility or redemption in gold, as no claim for any gold was acknowledged in the National Bank.

"11. That it continued for nearly 400 years with all these extraordinary attributes, producing no financial derangements and no opposition; but, on the contrary, grew until it exceeded the money per capita of any nation in Europe, ancient and modern, and was the pride of Venice, the envy of Europe.

"12. That it only fell when Napoleon conquered Venice, when it had reached an issue exceeding \$16,000,000 of government credit or money for 200,000 people, excluding the dependencies of Venice.

"13. That Napoleon could not and did not find a ducat in its vaults, as there had never been a pretense of any. That he would have taken gold if it was there is clear, and thus have been strengthened to further enslave Venice.

"14. That the interest alone saved on each million ducats was \$6,250,000,000,000 at 4 per cent. for 400 years, savings-bank interest."

On the other hand, Professor Dunbar, in Palgrave's *Dictionary of Political Economy*, gives an account different in several essential points. According to him, the bank was simply a bank of deposit under public officers. In 1619 it was changed into the Banco del Giro, long known as the Bank of Venice. It received funds both for the State and individuals, making a small charge for holding private deposits. Transfers were made upon the books by the order of depositors; bills of exchange were paid, and the tender of payment for any sum not less than 100 ducats could not be refused. Loans to the government compelled it to suspend more than once, especially from 1717-39. For the greater part of its existence, however, it received or paid out cash on demand. It kept its accounts in ducats *banco*, which had no corresponding coin, but were credited or redeemed by the bank as might be required at an advance of 20 per cent. above the ducat *effectivo* of the mint. Whatever be the origin of this, it seems finally to have represented a mere difference of denomination. The bank was so successful that in 1766 it was able to reduce the interest on its funds to 4 per cent., at the same time offering payment of their principal to those who were unwilling to accept that rate.

BANKRUPTCY, the state of being bankrupt or insolvent; in *law* specifically, the status of a person or corporation that by reason of insolvency has been adjudicated a bankrupt. *Bankruptcy laws* are statutory regulations under which the property of an insolvent may be distributed among his creditors, with the double object of enforcing a complete discovery and an equitable distribution of the property, and of discharging the debtor from his obligations and from future molestations by his creditors. Such laws have existed in England from

the time of Henry VIII. In the United States, Congress has power by the Constitution (Art. I, Sec. 8, clause 4) to establish such laws through the United States.

As the States also have the right to pass similar laws affecting their own citizens whenever there is no national law on the subject in force, it is customary to distinguish between national and State laws by calling the former bankrupt and the latter insolvent laws. Three times only in the history of the government has there existed a bankrupt law. The first was passed in 1800 and was repealed in 1803; the second became law in 1841, and was taken from the statute books in 1843; the third had the longest life: it became law March 2, 1867, and was repealed on June 7, 1878, the repeal to take effect September 1 of that year. There is at present a considerable demand for another bankrupt law to secure uniformity throughout the country.

Mulhall gives the following averages of failures in the United States:

	Average Failures.	Amount per Failure.
1857-60.....	3,262	£7,100
1861-65.....	1,830	5,800
1866-69.....	2,425	6,200
1870-75.....	4,882	6,100
1876-80.....	7,970	4,100
1881-86.....	8,823	3,200
1889.....	11,719	2,400

According to the *World Almanac*, the figures being taken from *Bradstreet's* returns, the failures in the United States since 1889 have been as follows:

	Failures.	Liabilities.
1890.....	10,673	\$175,032,810
1891.....	12,394	193,178,000

FAILURES FOR FIRST NINE MONTHS.

1892.....	7,378	\$76,971,771
1893.....	11,174	324,087,768

According to Mulhall, the failures in England averaged:

1870-72.....	6,039	1870-81.....	11,052
1873-75.....	7,766	1882-84.....	7,263
1876-78.....	10,077	1885-88.....	4,587

BANKS, REV. LOUIS ALBERT, D.D., was born at Cornwallis, Ore., in 1855. He was educated in the public schools and at Philomath College of that State. In 1883 he was ordained an elder in the Oregon Conference of the M. E. Church, and has since served pastorates at Portland, Ore., Boise City, Ida., Vancouver and Seattle, Wash., and Cincinnati, O. Since 1886 he has been a pastor in the East, where he has had marked success. While in Vancouver he edited the *Pacific Censor*, State organ of the Washington Temperance Alliance, and so enraged the liquor dealers that in June of 1880 he was shot down on the streets by one of their agents. For two months he preached reclining

across chairs to eager crowds. He has been a close student of the labor problems, his revelations as to the Boston sweat shops bringing him national reputation. He is the author of *White Slaves*, in which he published the results of his sweat-shop investigations. At the State Convention of Massachusetts Prohibitionists, held September 8, 1893, at Worcester, he was nominated for governor.

BANKS AND BANKING.—A bank may be defined as an institution for receiving money at or without interest, for loaning, discounting, or transmitting money, and sometimes for issuing notes. Banking is the business carried on by a bank. The banking institutions of the United States may be classed as national and State banks, savings-banks, private banks or bankers, cooperative banks, and loan and trust companies. (See SAVINGS BANKS; COOPERATIVE BANKS; CURRENCY.)

I. GENERAL HISTORY.

The name "bank" is derived from the Italian *banco*, a bench, from the benches in the markets on which the early money-changers were wont to sit. Jeremy Taylor says, "Exchangers of money made the temple to be the market and the banke" (*Great Exemplar*, vol. ii., chap. 2).

Passing by obscure references to money-lenders and usurers on Assyrian tablets in Egyptian records and classic and sacred literature, the history of banking begins with the Bank of Venice, and is continued in the history of the Banks of Genoa, Amsterdam, Hamburg, and the Bank of England, accounts of all of which will be found under their respective names.

We present here a general account of banking in Europe, and then a more detailed account of banking in England and the United States. Altho the Bank of Venice was perhaps the first real bank, the origin of modern banking is largely to be found in Florence.

Mr. Macleod says (*Banking*, vol. i., p. 289): "The names of the Bardi, Acciajuoli, Peruzzi, Pitti, and Medici were famous throughout Europe. In 1345 the Bardi and the Peruzzi, the two greatest mercantile houses in Italy, failed. Edward III. owed the Bardi 900,000 gold florins, which his war with France prevented him paying; and the King of Sicily owed them 100,000 gold florins. The deposits of citizens and strangers with the Bardi were 550,000 gold florins. The Peruzzi were owed 600,000 gold florins by Edward III. and 100,000 by the King of Sicily, and the deposits they owed their customers were 350,000 gold florins. The fall of these two great pillars of credit involved that of multitudes of other smaller establishments, and, says Villani (*Istor. Fiorent.*, vol. xii., p. 55), the community of Florence had never been thrown into such ruin and disorder before. And thereupon he breaks out against the folly of his fellow-citizens entrusting their money to the care of others for the love of gain. The city, however, recovered from this terrible disaster, and we find that between 1430-33, 76 bankers at Florence lent 4,865,000 gold florins. At one time Florence is said to have had 80 bankers, but not any public bank."

The first bank to be established on really modern principles as a bank issuing notes payable to bearers at sight is the Bank of Sweden, established by a Swede named Palmstruck, in 1656. Its first bank-note was issued in 1658. His bank became the Riks Bank (Bank of Sweden) in 1688. It still carries on business in Sweden as the national bank.

**Continental
European
Banking.**

Banking in Germany, save for the great Bank of Hamburg, presents little of interest. Each German State had its own banking laws and banks of issue, confined mainly to its own neighborhood. After the unification of the empire—an act of 1875—the Bank of Germany (*g.v.*) was established, and 32 banks were recognized as possessing rights of uncovered issue of 135,000,000 marks, the bank of Germany being allowed 250,000,000 marks. The State itself has the right of issue of 120,000,000 marks in small denominations. German banking has now a capital of \$425,000,000 and deposits of \$730,000,000. The amount of issue is \$320,000,000, and it has \$295,000,000 of specie in safe.

France has many large banks besides the Bank of France (*g.v.*), among others the Comptoir d'Escompte, founded 1848; the Crédit Foncier and Crédit Mobilier, 1852; the Crédit Lyonnais, 1863; the Société Générale, 1864.

The capital in French banking is \$601,000,000; deposits, \$640,000,000; issue, \$607,000,000; specie in safe, \$505,000,000.

England has many old banks. Says Mr. Courteney: "The still existing bank of Messrs. Smith & Co., of Nottingham, the parent of the London establishment of Messrs. Smith, Payne & Smiths, claims to have been established in 1688; the Bristol Old Bank (Messrs. Baillie, Cave & Co.) dates from 1750; the Hull Old Bank (Messrs. Pease & Co.) from 1754; and many other country banks trace back their history to the latter half of the last century. It is believed that all these bankers issued their own notes payable to bearer as part of their business; and they were not very scrupulous in regard to the magnitude of the sums for which they were given. The Bank of England had not issued any notes for less than £20 previously to 1759, when it commenced the issue of £10 notes; but the country bankers put in circulation notes for such small sums, that Parliament enacted, in 1775, that none should be issued for less than £1. In 1777 this minimum limit was further raised to £5, but in spite of this restriction the number and the amount of the issues of the country bankers soon become dangerously multiplied."

**Banking
in
England.**

In 1792 there were said to have been 350 banks. In the panic of 1792-93 (see BANK OF ENGLAND), about 300 banks suspended payments, and 50 were totally destroyed. After the panic, however, banks gradually multiplied till 1825, when the circulation of notes of less than £5 was forbidden. Joint-stock banks with any number of partners were allowed to issue, but did not multiply again till 1834-36, when there was a rush into banking, leading to the passage of the Banking Act of 1844 (see BANK OF ENGLAND). Of present English banking, Professor

Dunbar gives the following statement in Palgrave's *Dictionary of Political Economy* :

“The majority of the banks in England and Wales, including the largest and most important banks, do not issue their own notes. The act of 1844 fixed the maximum circulation of the country banks in England and Wales at £5,153,417 (207) private banks, £3,478,230 (72) joint-stock banks ; but of this amount, £2,368,960 (126) private banks, and £1,462,470 (35) joint-stock banks, have since lapsed from various causes, voluntary and other, so that the limit of the provincial issues now (1890) stands at £2,784,457 (74) private banks, £2,015,760 (37) joint-stock banks. In addition to these there are 67 private and 43 joint-stock provincial banks which do not issue their own notes. The different banks vary much in size and importance. By the side of very large banks, wielding immense amounts of capital and deposits, very small concerns, possessing proportionally small resources, may be found carrying on business to advantage, and competing successfully with their more powerful rivals. One result, and it is a very peculiar one, of the manner in which our banking system has developed itself, employing the Bank of England as the pivot of its transactions, is that no bank in the country keeps any large stock of the precious metals in reserve—more, in fact, than habit has shown to be adequate for daily requirements—except the Bank of England.”

The earliest banking institution in North Britain was the Bank of Scotland, instituted by a charter of incorporation from the Scots Parliament in 1695. The original capital was £1,200,000 Scots, or £100,000 sterling. In 1774 the amount of stock was extended to £200,000 sterling ; now it is £1,250,000 sterling. In 1727 a new and similar establishment was constituted under the title of the Royal Bank of Scotland, whose advanced capital is now £2,000,000. In 1746 another association was formed and incorporated by royal charter, with the title of the British Linen Company.

No legislature, however, prevented the practice of any kind of banking, and Scotch banking

developed in ways of its own. Early in the present century joint-stock banks were formed, and the old private banks became absorbed in these. They are not many in number. By an act of 1845 no banks established after that date could issue notes—a condition which has given the old banks a practical monopoly, tho they have adapted themselves to the needs of the country by establishing many branches. In 1890 there were only 10, but with nearly a thousand branches. Their average circulation was £6,278,000, and their deposits about £89,000,000. They all possess the power of circulation, and since they allow interest on deposits, they hold almost the whole capital of the country, but are uniformly well conducted.

Banking in Ireland has few distinctive characteristics. There are (1895) nine banks in Ireland, whose total deposits in 1890 were about £39,000,000. The Bank of Ireland has an authorized circulation of £3,738,428. The deposits in the banks of the Australian colonies in 1890 were £108,000,000, being largely the conduit pipes for English capital.

Ireland and English Colonies.

The history of currency and banking in Canada has four periods : (1) the French régime ; (2) from the beginning of British government until the establishment of the first banks, 1817-18 ; (3) to the confederation of the provinces and the banks being organized under provincial and royal charters ; (4) since 1867, when the Dominion Parliament has had exclusive jurisdiction regarding banking.

Canada.

No reserves are required by law, but the cash reserve in gold and legal tenders averages about 10 per cent. The larger banks keep their available reserves in security loans in New York and Chicago. Forty per cent. of the cash reserves must be in Dominion legal tenders. The banks, since confederation, have provided a currency readily convertible into specie, the volume rising and falling some 20 per cent. with the requirements of trade, largely affected by the seasons.

The following, from the report of the Comptroller of Currency of the United States for 1892, gives a

SUMMARY OF THE CONDITION OF THE THIRTY-NINE CHARTERED BANKS OF THE DOMINION OF CANADA, ON OCTOBER 31, 1892.

RESOURCES.		LIABILITIES.	
Mortgages on real estate.....	\$846,797	Capital paid in.....	\$61,800,372
Loans on bonds and stocks.....	20,392,077	Reserve fund.....	24,832,474
Current loans.....	194,123,365	Notes in circulation.....	38,688,429
Loans to the Canadian Provinces.....	2,372,527	Due to the Dominion Government.....	2,524,785
Overdue debts.....	2,452,157	Due to the Provincial Governments.....	3,993,381
Deposits to secure circulation.....	1,761,259	Demand deposits.....	66,427,727
Dominion bonds.....	3,523,496	Time deposits.....	99,934,970
Canadian municipal, etc., securities.....	8,523,980	Due to other banks and agencies.....	7,922,998
Railway securities.....	8,137,590	Other liabilities.....	209,394
Due from other banks and agencies.....	28,110,162		
Real estate and bank premises.....	5,740,229		
Notes of and checks on other banks.....	8,954,339		
Specie.....	6,708,841		
Dominion notes.....	11,813,254		
Other resources.....	1,043,493		
Excess of liabilities.....	1,425,066		
Total resources.....	\$306,343,530	Total liabilities.....	\$306,343,530

II. BANKING IN THE UNITED STATES TO THE PERIOD OF THE WAR OF THE REBELLION.

This section of the history of banking in the United States is abridged from Professor W. G. Sumner's *History of American Currency*, supplemented by statistics from the reports of the Comptroller of the Currency.

As early as 1690 the colony of Massachusetts issued bills of credit, making the paper legal tender for taxes and other debts, the notes being payable to the bearer on demand. This was five years before the establishment of the Bank of England; and William Paterson, the father of that bank, had been in the colonies and studied the Massachusetts experiment. This issuing of bills of credit was repeated with various modifications by Massachusetts and the other colonies through all their history; but as it comes rather under the history of currency than of banking proper, we refer the reader for all details of the antevolutionary period to CURRENCY.

We may simply note, however, that in 1739 a land bank and a specie bank, according to modern banking methods, were started in Massachusetts. The latter, however, closed in 1740, when Parliament extended the old Joint-Stock Companies' Act (passed after the South Sea Bubble, 1720) to the colonies; the former bank, however, struggling and battling for its life for the next ten years.

December 31, 1781, Congress chartered the Bank of North America in Philadelphia. It had a capital of \$400,000, and took its origin in a union of citizens of Philadelphia, formed to supply the army with rations. They were allowed to form a bank and to issue notes to buy the articles required. Congress ordered bills drawn on American ministers abroad to be deposited in the bank as a guarantee of payment; \$70,000 in specie were subscribed by individuals in 1782, and the remainder by Government, out of the proceeds of a foreign loan. It issued convertible notes, redeemable in Spanish dollars; but the people were slow to take them. However, it made large dividends, and was attacked by a rival, which it was obliged to absorb, and by an effort to have its charter repealed. This effort succeeded so far as the State charter was concerned; but it went on under the charter of the Continental Congress, till it was rechartered by Pennsylvania.

The first bank of the United States under the Constitution was chartered by Congress in 1791. The capital was \$10,000,000. One fifth of the stock was owned by the United States and \$8,000,000 by the people. Six of the eight millions were Government indebtedness; and \$2,000,000, money. Notes of the bank were made receivable for all obligations due the Government for 20 years, or during the life of the charter. The bank always paid coin when demanded, but the notes were legal tender to the Government, and, therefore, satisfactory to the people, whether the bank paid coin or not. This was made plain by the law, and was demonstrated in the last four years of the life of the charter, when

the most bitter controversy was carried on between the bank and the President and Cabinet. When the time came to renew its charter (1811), 90 State banks had grown up to oppose it. It had been successful, and paid 8 or 10 per cent. a year to its stockholders. It was charged that the bank controlled elections in the State, and was then laboring to control those of the nation. Reports charging the bank with corruption, and even insolvency, were circulated, and the charter was not renewed. The following table, from the report of the Comptroller of the Currency for 1892, gives a convenient *résumé* of the banks in the United States in the period we are now considering:

Statement showing the Specie, Circulation and Capital and the Number of Banks in the United States for the Years mentioned.*

YEAR.	No. of Banks.	Specie.	Circulation.	Capital.
1774.....	..	\$4,000,000
1784.....	3	10,000,000	\$2,000,000	\$2,100,000
1790.....	4	9,000,000	2,500,000	2,500,000
1791.....	6	10,000,000	9,000,000	12,900,000
1792.....	16	18,000,000	11,500,000	17,100,000
1793.....	17	20,000,000	11,000,000	19,000,000
1794.....	17	21,500,000	11,600,000	18,000,000
1795.....	23	16,500,000	11,000,000	19,000,000
1796.....	24	16,500,000	10,500,000	19,200,000
1797.....	25	16,000,000	9,000,000	19,200,000
1798.....	25	14,000,000	10,000,000	21,200,000
1799.....	26	17,500,000	10,500,000	21,300,000
1800.....	28	17,000,000	11,000,000	22,400,000
1801.....	31	16,500,000	10,000,000	22,600,000
1802.....	32	16,000,000	11,000,000	26,000,000
1803.....	36	16,000,000	11,000,000	26,000,000
1804.....	59	17,500,000	14,000,000	39,500,000

Banking of the wildest kind was now the rule. After 1805 notes were allowed for sums under \$5, and finally were issued as low as for 25 cents. Specie was driven out. A crash came in 1809. **From 1800 to 1813 the New England Bank was the Rebellion.** Severe bank laws were passed. In 1813 the New England Bank was chartered as a bank of redemption at Boston, in order to keep the paper of the adjacent county at par. It did this, but was unpopular, and was the beginning of the Suffolk bank system.

The note circulation of the banks of the country is estimated, in 1811, by Gallatin, at \$46,000,000. In Pennsylvania, 1813-14, 41 banks were chartered by Legislature over a veto. The country being at war, \$57,000,000 were borrowed by the Government from 1812 to 1814. Treasury notes for one year were issued in 1812 to the amount of \$3,000,000; in 1813, to \$6,000,000; and in 1814, to \$8,000,000. Silver flowed to New England. In 1814 all the banks save those in New England suspended payment. Notes were depreciated from 20 to 50 per cent. The Secretary of the Treasury now began to be engaged in the money market. He tried to get the banks to come to some agreement. He ordered that taxes should be received only in specie, treasury notes, or notes of banks which received treasury notes at par. Madison recom-

* Blodgett's *Economica*.

mended another national bank. The second United States bank was finally opened January 1, 1817. It began business with \$1,400,000 in specie, \$14,000,000 in stocks, and the rest in stock notes. It was to have a capital of \$7,000,000. A second instalment of \$2,800,000 was soon due, but only \$32,400 was paid in specie, the rest mainly from notes or discounts of the bank itself. The third instalment was still worse. The bank discounted its own stock at par to pay the instalment. In August, 1817, the bank discounted its own stock at 125. The facilities for stock-jobbing were used. Congress resolved that after February 20, 1817, only specie, treasury notes, and notes of specie-paying banks ought to be taken by the national treasury. The banks refused to resume before July, 1817. The Western banks were still comparatively sound. The Southern banks had become inflated. The inflation was increased during the year by the Government paying off \$11,000,000 of the public securities held by the banks. The note circulation at this time is estimated at \$100,000,000. By March, 1818, the discounts of the United States Bank were \$43,000,000—\$11,000,000 on stocks. It had \$2,000,000 in specie. It had now 18 branches, but only \$3,000,000 of specie in them all. Its operations in the West drew that region into the "golden" age.

The Second National Bank.

The bank now bought \$7,000,000 bullion in the West Indies. Fifteen months after it was started it was doubtful if the bank was solvent. In November, Congress appointed a committee of investigation, which reported unfavorably; but Congress would not respond, 40 members being stockholders. On April 1, 1819, the state of the bank was: specie, \$126,745.28; notes, \$6,000,000; due other banks, \$79,125.99; due Government, \$500,000; due Barings, \$900,000; there were \$267,978.09 in the mint and \$250,000 in specie on the way from the West. The New York and Boston branches were in a worse condition. The bank now took energetic measures to save itself, and in 70 days was solvent, but had ruined the community. In August, 1819, there were 20,000 seeking work in Philadelphia, and a similar state of things existed in other cities. Land in Pennsylvania was worth, in 1809, \$38 per acre; in 1815, \$150; in 1819, \$35. The note circulation of the country in 1812 was about \$45,000,000; in 1817, \$100,000,000; in 1819, \$45,000,000. Financial distress was general, and lasted till 1823. Money was plentiful in the hands of those who had no debts to pay, as they would not invest. In 1823 the circulation of the United States Bank was very low—\$4,081,842; but there was a great creation of banks, and the bank began to expand and receive the notes of all its branches.

In 1824 Pennsylvania rechartered the banks of 1814. In 1825, 52 charters were petitioned for for New York banks, and when they could not be obtained, were petitioned for in New Jersey. The Bank of the United States increased its issue over \$3,000,000. Business revived in England. Heavy orders for cotton ran its price here up to 27 cents. In July the fall of prices in England caused a fall here, and 50 failures took place in New York before December. The

United States Bank was in great difficulty. In 1826 there was dulness and reaction throughout the year. In 1827 money was plentiful, and continued so with some changes till 1831. President Jackson commenced his attack on the United States Bank in his first message (1829). About 1830 American securities began to attract English investments, in canals, steamboats, and, later, in railroads. Currency, however, became more and more of a political issue. Jackson committed his party to hard money; Clay committed himself to protection. Webster, originally a free-trader, became a protectionist. Calhoun, originally a protectionist, became a free-trader. In 1832 the United States Bank petitioned for a renewal of its charter, which was to expire in 1836. The bill passed both houses, but was vetoed by the President. A violent warfare was now begun by the bank. It is certain that the bank had paid little heed to the laws of the State or of prudence, expanding or contracting according to will. In 1832 Jackson defeated Clay by 288 to 49 in the electoral college. In his message in December, 1832, he recommended the sale of the \$7,000,000 stock of the United States Bank which was opened by the nation, and an investigation into the bank. Bank shares fell from 112 to 104, but recovered to 112 on a favorable report of the treasury agent. This report showed \$79,000,000 assets and \$37,000,000 liabilities, besides \$35,000,000 capital and \$7,000,000 surplus. But when the Government desired to pay the three per cents in July, 1832, the bank agreed to pay the interest on them if the payment might be delayed so long. It thus negotiated a loan of \$5,000,000 from Barings; the reason given was for fear of the cholera. This caused fear for the public deposits, but a resolution that they were safe was carried, through the influence of the bank, 109 to 46. After Congress adjourned (September 22, 1832), the President ordered Mr. Duane, the Secretary of the Treasury, to remove the public deposits from the bank. He refused, and was replaced by Mr. Taney, who did it. The order was that the collectors should send no more deposits to it, but to State banks. There was no sudden transfer, but it was proposed to withdraw at intervals. The bank began war, and began to draw in its loans. On the assembling of Congress, the Senate resolved (28 to 18) that the President had usurped unconstitutional powers. The House never noticed the resolution, but resolved (134 to 82) that the bank charter should not be renewed. The contraction of the money market caused great distress. It was stated that the bank caused this to obtain a renewed charter. It was claimed that they loaned to a select few who reloaned at usurious rates. The aggregate amount of loans, however, steadily decreased all these years.

The Bank War, 1832-1836.

Meanwhile, the bank war went on. The bank, finding that it could not coerce the people, and that smaller banks were taking its place, changed its policy and expanded, President Jackson using this as a proof that it had unnecessarily contracted before. The President induced many of the States to pass laws forbidding the issue of small notes, and this largely favored con-

vertibility. These were times when cotton could command good prices, and railroad and other investments and speculation was good. The public debt was now nearly extinguished. On July 11, 1836, the President issued the famous Specie Circular, by which he ordered agents for the sale of public lands to take specie only. Congress in December passed an act rescinding this, but it did not become law, the President not signing it. The United States Bank not being able to renew its charter, now obtained a charter from Pennsylvania—by bribery, as it was asserted. It had not yet paid back the Government stock or the dividends which it held for contracting a loan with France that finally never materialized. It continued to reissue the notes of the old United States Bank which it received. Gold, being forced on the market in this country, came here from England. In April, 1836, the gold reserve in the Bank of England began to lower, and this continued all summer. The bank rate was raised twice. By November failures began, and in one day three houses doing large business with this country failed. Demand for cotton went down. Nowhere had paper money been more in use than in the South. In March, 1837, several New Orleans houses failed. Next, the pressure was felt in New York, and then became general. There were 100 failures in New York in March, and the losses were \$15,000,000. In March a meeting was held in New York, addressed by Webster. He laid the trouble

The Panic of 1837.

to the Government interfering with the currency and to the Specie Circular. A committee of 50 was sent to the President (Van Buren) to ask for its rescinding. The committee, in its address, spoke of 250 failures and 20,000 individuals discharged by their employers, and they laid it all to the effort to put metallic in place of paper currency. But they could obtain nothing from the President. In May the New York banks suspended in a body, a law being passed allowing them to suspend for one year. Among the direct causes of this was the demand upon the Government deposit banks for the \$40,000,000 surplus to be paid in specie. Suspension became general through the Union. Specie was driven out of the market, and all kinds of notes circulated instead. The New York banks then began to contract to be ready to resume. Nearly all the banks made money by the suspension, and paid good dividends during the year. In 1835-36 there had been a surplus in the treasury. Mr. Clay wanted it divided between the States, and Webster favored this. The administration opposed it, and wanted public lands surveyed and sold at \$1.25 per acre, with a homestead provision for settlers, the surplus revenue to be spent on national defences. The bill for distribution passed in the Senate, but never came up in the House. In 1836 the Senate passed a bill for "depositing" the surplus revenue (that being regarded as the part which came from the land). The plan for distributing had found no favor in the House, but "depositing" passed. It was declared that this was only a change in name, and the event proved this. Three deposits were made: Then in 1837 the President made known an estimate of a deficit of \$6,000,000, and

proposed to meet it by retaining the fourth instalment of the deposit, and to issue treasury notes for immediate necessities. These were issued, bearing interest, and the deposit was put off till January 1, 1839, and when that day came the treasury had a deficit, and could not pay it. Some States had been led by this deposit into extensive improvements and debts; others distributed it, a few shillings per capita, to be "received with contempt" or "rejected with scorn." The distresses of 1837 were aggravated by a failure of the wheat crop. Early in 1838 Congress passed an act forbidding the Pennsylvania Bank of the United States from using the old United States Bank notes. On May 10, 1838, most of the banks in New York City and in the Union resumed, the Bank of England sending \$1,000,000 to aid them. On August 13 almost all other banks resumed. There was a general revival of trade, but it was not permanent. Gold in the Bank of England again declined. The Bank of Belgium failed. The Bank of England borrowed £2,500,000 of the Bank of France. During the same year the Bank of the United States became involved in cotton speculations. Several banks, especially in the South and West, failed. The management of the United States Bank became reckless. It owed from \$10,000,000 to \$20,000,000, and tried to borrow of various banks in Europe. On October 10, 1839, it failed, and carried with it all the banks of the South and West. Three hundred and forty-three out of 850 banks in the Union closed entirely, and 62 partially. Some \$2,000,000 of Government deposits were lost. This suspension lasted by law till January 15, 1841. As soon as the bank opened again a run on it commenced, and it suspended finally (February 4, 1841). Its capital was a total loss, and the \$7,000,000 United States stock subscribed by the Government is mentioned by the Secretary of the Treasury (*Finance Report*, 1872, p. 18) among the items of the debt for which no cash ever came into the treasury. The years following 1842-43 were among the gloomiest years in industry. It seemed paralyzed by the failure of our banking system.

When it failed, the Bank of the United States owed the Bank of England \$23,000,000. Its failure, and, above all, the repudiation of indebtedness by several States, ruined American credit abroad, and cost the bank many friends here. In 1840 the Independent Treasury Act was passed, giving the Government the custody of its own funds. It was only accomplished after a severe struggle, as it withdrew the public funds from use as banking capital. In 1841 Mr. Harrison became President, and called an extra session of Congress, May 31, which met under President Tyler after Harrison's death, and the first act of the session was to repeal the Independent Treasury Act. Mr. Clay had proposed a national bank, an increase of duties, and a land distribution bill; but the senator from Mississippi introduced a bankruptcy act, and this was bargained off for the Bank Act and the Distribution Act, and the three went through together. The Bank Act was very sweeping—declared the abolition of all debts

Widespread Depression.

where effects were surrendered and fraud not proved. The Land Distribution Bill was the new form of the defeated bill for assuming the State debts. The income from public lands (less than \$1,500,000) in 1846 was to be divided among the States to help them pay their debts. President Tyler wanted the words "fiscal agent" or something "fiscal" substituted for the word "bank," and vetoed two bills for incorporating a bank. The treasury, being unable to pay specie, paid treasury notes, but one of these being protested (January, 1842), the Government paid

specie, and continued doing so till 1862. In 1843 the Bankruptcy Act was repealed. It was argued that it was worse for debtors than creditors, since he who availed himself of it could get no further credit. The Government was fixed in the hard-money system.

The following tables, from the report of the Comptroller of the Currency for 1892, give a convenient statement showing the principal items of resources and liabilities of the Bank (Second) of the United States from 1817 to 1840 :

YEAR.	RESOURCES.					
	Loans and Discounts.	Stocks.	Real Estate.	Banking House.	Due by Foreign Banks.	Due from State Banks.

1839.....	662	327,132,512	135,170,995	90,249,146	492,278,015	45,132,673
1840.....	722	358,442,692	106,968,572	75,666,857	462,896,523	33,105,155

Among the new measures were the Suffolk Bank plan in Massachusetts, and the New York Safety-Fund System. The Suffolk Bank plan was merely an arrangement whereby that bank was made the channel through which all notes of New England banks that found their way to Boston, as most of them naturally did, were at once forwarded to the issuers for redemption. The result was that all solid bankers found it for their interest to deposit with the Suffolk a redemption fund, as that insured the acceptance of their notes.

The New York Safety-Fund System, which is the cardinal principle of the present national banking plan, required each bank to deposit, with the banking department of the State, securities consisting of federal or State stocks, or bonds and mortgages, which, in case of the failure of the bank, were sold, and the proceeds applied to the liquidation of its debts.

From 1844 things began to mend. Failure of crops in Europe and the abolition of the corn laws gave a market for breadstuffs, of which, in 1843, \$37,500,000 were exported. The Irish famine and other causes made immigration set in. Railroads were rapidly developed, and the discovery of gold in California added another powerful element to the

1840-1860. industrial development. Our credit abroad slowly mended. By 1854 it was estimated that \$200,000,000 of State, railway, and other bonds were held abroad, and in 1857, \$400,000,000. Bank-notes also expanded. Gold was exported ; currency set toward the financial centers, the country banks keeping their balances generally in New York. These balances were required in the fall, producing contraction and stringency. In 1853-54 fears of a war in Europe, failure of early speculations in California, the discovery of a fraudulent issue of \$2,000,000 of New York and New Haven Railroad stock, caused a panic. A small crop and other evils added to this. A large number of private bankers were carried down. But the large supply of metallic currency prevented widespread evil. In 1856 railroad building and good crops improved the situation. A fall in stocks, however, in the summer of 1857, the fail-

ure of the Ohio Life and Trust Company, which borrowed largely in New York, the loss of the steamship "Central America" with over \$1,000,000 of treasure, caused a panic. A large number of failures took place in September. In October all the New York banks save one suspended, and were followed by almost all others. Bills were not salable ; gold began to move this way. The Secretary of the Treasury aided by purchasing bonds. The New York banks resumed December 12, and others followed.

The Panic of 1857.

The condition of the first bank of the United States during the period from January, 1809, to January, 1811, is shown in the following table, which is taken from the letters of Albert Gallatin printed in the *American State Papers (Finance)*, vol. ii., pp. 352 and 470 :

REPORTS OF CONDITION OF THE FIRST BANK OF THE UNITED STATES.

	January, 1809.	January, 1811.
RESOURCES.		
Loans and discounts.....	\$15,000,000	\$14,578,294
U. S. 6 per cent. and other U. S. stock.....	2,230,000	2,807,046
Due from other banks.....	800,000	894,145
Real estate.....	480,000	500,653
Notes of other banks.....	393,341
Specie.....	5,000,000	5,009,567
Total.....	\$23,510,000	\$24,183,046
LIABILITIES.		
Capital stock.....	\$10,000,000	\$10,000,000
Surplus.....	510,000	509,678
Circulation outstanding.....	4,500,000	5,037,125
Individual deposits.....	6,500,000	5,920,423
United States deposits.....	5,920,999
Due to other banks.....	634,348
Unpaid drafts outstanding.....	17,473
Total.....	\$23,510,000	\$24,183,046

The bank had been quite successful, and paid 8 or 10 per cent. a year to its stockholders.

* Elliott's *Funding System*, p. 984.

The following table, prepared by the Comptroller of the Currency in his report for 1892, gives the position of the State banks from 1834-63 :

TABLE SHOWING THE AGGREGATE NUMBER OF STATE BANKS IN THE UNITED STATES AND THEIR PRINCIPAL LIABILITIES AND RESOURCES IN THE YEARS 1834-63.

YEAR.	No. of Banks.	LIABILITIES.				
		Capital Stock.	Circulation.	Deposits.	Due to Banks.	Other Liabilities.
1834.....	506	\$200,005,944	\$94,839,570	\$75,666,986	\$26,602,293

NOTE.—The figures for the years 1834-40 are taken from Ex. Doc. No. 111, Twenty-sixth Congress, second session. Those for 1841-50 are from Ex. Doc. No. 63, Thirty-first Congress, first session. For the years 1851-63 (with the exception of the year 1853) they are taken from the report on the condition of the banks for 1863. Those for 1853 are from Ex. Doc. No. 66, Thirty-second Congress, second session, and are incomplete.

III. THE WAR PERIOD AND THE NATIONAL BANKING SYSTEM.

When the War of the Rebellion began, the paper in circulation in the country was about \$200,000,000—about three fourths among the loyal States. The specie available was estimated at \$275,000,000. The opinion was that the war would be short.

Congress voted \$50,000,000 of demand notes, \$250,000,000 of 7.3 per cent. treasury notes to run three years, and a 6 per cent. loan of \$250,000,000 to fund the treasury notes. A property tax was apportioned among the States, but part of it was repealed, part of it was paid by charges for sums expended in fitting out troops, and it produced no active revenue to the general Government. In the fall of 1861 the Government borrowed \$100,000,000 in gold of the banks in two instalments, and \$50,000,000 more in paper. Such was the situation when Congress met, December, 1861. The treasury report of Mr. Chase presented no strong policy. Gold began to be exported. On December 17 the New York banks resolved that suspension was unnecessary, but in the last days of the month all the banks suspended, Professor Sumner says unnecessarily. Gold rose to a premium of 1 or 2 per cent. Bank paper drove the gold out. The Government could not borrow more gold, because the stock in the banks had been exhausted. It would have to take irredeemable paper notes. In February, 1862, Congress authorized the issue of \$150,000,000 in notes, of which \$50,000,000 was for withdrawal of the demand notes. This was the famous Legal Tender Act. The notes were legal tender except for imposts on duties and interest on the public debt. The friends of these "greenbacks" claim that it was this limitation which caused them to depreciate; but we are here only concerned with the fact and its bearing on the banking system. (For details of these notes, see CURRENCY.) Whatever be the reason, they did depreciate. Gold rose, and was exported. By August, Professor Sumner says that specie had disappeared. In July a bill was passed for issuing stamp as fractional currency. The Government went from one makeshift to another. The treasurer sold 6 per cent. bonds at par, indeed, but for currency worth from 60 to 70 cents on the dollar. The desire for a national banking system grew general. The plan finally adopted was not wholly new. We present a statement of its abridged form, a paper by D. B. Waldo, published in No. 1 of the Publications of the Michigan Political Science Association. He says in substance:

Albert Gallatin, in a famous proposition, advocated a prohibitory tax on existing bank-notes and the establishment of a currency founded

on public stock, or possibly mortgages on real estate. Tho admitting objections to the latter security, he contended that if the objections could in any way be removed, the plan proposed would give to the banking system of

America solidity, and inspire a confidence which could not otherwise be secured. The ideas contained in the above suggestions soon fruited into

legislation. The propositions introduced in the Legislature of Maryland were followed by an enactment of the Legislature of New York creating a new banking system. There were precedents on American soil in the form mainly of suggestions from writers for various periodicals, yet to some extent of institutions in actual operation. John J. Knox, in his excellent review of the national banking system, ascribes the first suggestion of its underlying principles to an unknown writer of the *Analectic Magazine*, who, writing in 1815, a period of utter demoralization in our currency, advocated a system in which public funds were to serve as the basis, support, and limit of American money. In 1816 a letter of Curtius, addressed to the Secretary of the Treasury, embodied similar ideas, which were further elaborated in a communication of one Rev. Dr. McVicar to a member of the New York Legislature in 1827.

It is well-known history that this new banking system of the Empire State proved eminently safe and satisfactory, but to the national application of the principles embodied in the New York plan there remained the obstacle of a formidable opposition to every description of banks of issue inherited from the experience of reckless banking. It was finally favored only under pressure of war necessity. Secretary Chase, in his first annual report (1861), submitted two plans: first, that of the withdrawal of State bank issues and the substitution of United States notes payable in coin on demand. Against this he interposed the following objections: First, the temptation to issue without adequate provision for redemption; second, the ever-present liability to be called upon for redemption beyond means, however carefully provided for and managed; third, the hazard of panics precipitating a demand for coin concentrated on a few points and a single fund; fourth, the risk of a depreciated and depreciating, and finally worthless paper money; fifth, the innumerable evils of dishonored public faith and national bankruptcy—all these, he said, were possible consequences of the adoption of the suggested system of government circulation. These objections, of course, being deemed fatal, the secretary discussed the advantages of a second plan, that of the national banking system, substantially as finally adopted. But the country was not ready, and the suspension of the banks occurred as above stated.

In December of 1862, Secretary Chase again urged upon Congress the advantages of a national banking system, and reiterated the danger of United States notes. Meanwhile, the sentiment in and out of Congress had rapidly changed in favor of the proposition, and on February 25, 1863, a bill, recommended by Senator Sherman and favorably reported by the finance committee of the Upper House, became law.

The vote, taken in the Senate February 12, stood 23 to 21; that of the House, taken February 20, 78 to 64, the President signing five days later. It is needless to remark, in view of the immense personal financial interests involved and the prejudices to be overcome, that the discussion of the bill was decidedly warm. The

The
National
Banking
System.

ablest arguments for and against were those made in the Upper House by Senators Sherman and Collamer, the latter of Vermont. Senator Collamer's objections were that the State banks and the people would oppose such an institution, and, in consequence, would never buy the bonds, whose sale was to be the main prop of the system. He questioned the constitutionality of a proposed prohibitory tax on State bank issues, argued against the incorporation of institutions to be independent of State control, laid much stress upon the responsibility imposed upon the Government for the redemption of issues, and finally pointed out what he believed to be the political dangers involved in a measure of this kind. Favoring the bill, Mr. Sherman had already in an able argument dwelt upon the present evils of legal-tender issues and the probable future. He told again the story of State banks and their defects, then argued for the bill on the grounds of convertibility of issues, uniformity in size, a market for Government bonds; further, that the system would be a medium for the absorption of State bank-notes, and that the banks would be safe and convenient depositories of public money. Finally, there would arise a community of interests between stockholders, people, and government, and there would be developed the much-needed sentiment of nationality.

By this law any association of five or more persons was authorized upon deposit of registered or coupon bonds to the minimum amount of \$50,000 to receive 90 per cent. of the par value of the same in bank-notes, which, being properly signed, were receivable for all Government dues, except duties on imports, and were payable on all Government debts, except interest on bonds. In compensation for the issue privilege, banks organized under this act were required to pay a tax on circulation, the rate being fixed at 1 per cent. by amendatory legislation in 1864. Each association was required to conform to the law of its own State in the matter of interest rates, and was compelled to maintain a special reserve for its notes and deposits, and to redeem circulation at the place of issue.

The amount of circulation was fixed at \$300,000,000, to be distributed throughout the States, Territories, and District of Columbia, one half in proportion to the population, the remaining half in proportion to banking capital and business needs. The law provided for the establishment of a finance bureau, at the head of which was to be an officer called the Comptroller of the Currency, who was given general oversight of the entire system. The original bill has been repeatedly amended, yet its leading features, with certain important exceptions, remain valid to-day; the principal changes being made the next year, providing for redemption in certain specified leading cities, excluding coupon bonds from the list of securities, increasing the minimum of capital from \$50,000 to \$100,000, and providing for the easy conversion of State banks.

The bill had received the President's approval February 25, 1863, but it was nearly four months then before a bank was organized under it, and five before one was opened in the city of New

York. Up to December 10, 1863, only 134 had been incorporated, and up to November 25, 1864, only 534, of which 168 were State banks reorganized under the national law. It is obvious that up to this time the State banks had continued to supply the major part of the currency of the country.

Mr. Fessenden had now become the Secretary of the Treasury, and Mr. McCulloch Comptroller of the Currency, and they agreed in opinion that the time had come when it was necessary to discriminate against the State banks in some manner if the good to be hoped from the national system was to be realized. State bank systems were antagonistic to the national system, and they should not be suffered to exist unchecked and uncontrolled. It was indispensable to the financial success of the treasury that the currency of the country should be under the control of the Government, and this could not be the case so long as State institutions had the right to flood the country with their issues. So thought these officers; and under their recommendation Congress was induced to pass an act, approved March 3, 1865, which provided "That every national banking association, State bank, or State banking association, shall pay a tax of 10 per centum on the amount of the notes of any State bank or State banking association paid out by them after the first day of July, 1866." This act has in substance been continued to this day, and is now in force. Under and in consequence of it State banks of issue have ceased to exist.

For convenience of comparison with the development of our banking system, we give, from Mulhall's *Dictionary of Statistics*, the following table of the growth of banking power in the world in millions of pounds:

	1840.	1870.	1888-90.
United Kingdom.....	132	720	910
United States.....	90	440	1,030
France	16	64	268
Germany	12	49	231
Australia	5	38	134
Canada	3	12	40
The World.....	308	1,602	3,197

The banking power, consisting of capital, deposits, and right of issue, was as follows (1883-90) in millions of pounds:

	Capital, etc.	Deposits.	Issue.
United Kingdom.....	284	626	39
United States.....	270	760	26.7
France	140	128	121.4
Germany.....	85	146	64
Australia	26	108	5.4
Canada	13	27	6.3
The World.....	1,030	2,167	616.3

The following tables, prepared by the Comptroller of the Currency, and given in his report for 1892, tells the story of the development of the national system to 1892:

	Oct. 3, 1864.	Oct. 2, 1865.	Oct. 1, 1866.	Oct. 7, 1867.	Oct. 5, 1868.	Oct. 9, 1869.	Oct. 8, 1870.
	508 Banks.	1,513 Banks.	1,644 Banks.	1,642 Banks.	1,643 Banks.	1,617 Banks.	1,648 Banks.

* Stock savings banks included for the years 1873-86, inclusive.

For the details of the history since the war, we refer the reader to CURRENCY. It has been a period of changes in the currency rather than of banks or banking. The failure of the important house of Jay Cooke & Company in 1873 precipitated a crisis, but the holders of national bank-notes were amply protected by the treasury deposits. (See also CRISES.)

IV. PROPOSED BANK REFORMS.

Very recently (1895), owing to the silver question (see SILVER), there has come something of a serious agitation for the abolition of the tax on State banks. The Comptroller of the Currency (A. B. Hepburn) says, in his report for 1892, p. 15 :

"A conditional repeal of this 10 per cent. tax is proposed, conditioned upon compliance by the State banks with certain regulations imposed by Congress,

designed to secure circulation and protect note-holders against loss. Such State banks would then be national banks for the purpose of issuing circulating notes, and Congress must provide for their supervision and examination, to see that the laws are complied with. Can currency be better taken out by a bank organized under a State law than under an act of Congress? Would Congress or the country gain anything by the proposed divided jurisdiction over these banks of issue? Would not division lead to conflict and confusion? All national banks make reports of condition to the comptroller, on a past day, fixed by him, in such form as the comptroller prescribes, and upon blanks furnished by him. These forms are very complete as to balance sheet and detail. In order to comply with these calls, a bank's books must be so kept as to furnish the required information. These reports are of very great value to the banks themselves, in systematizing their bookkeeping and insuring good and uniform methods of business. The information reported, all on the same date, is of great value to the public. What would be gained by denationalizing our banks in all respects, except as to circulation? Can the various State legislatures be depended upon to provide better laws and better supervision than Congress?

"It is argued that 92 per cent. of all business trans-

actions consummated through banks are represented by credits—that is, exchanges and offsets—and that 3 per cent. only is represented by money. The Government does not assume to regulate the 92 per cent. Why should it the 3 per cent.? Why not as well allow State bank-notes to circulate? Their acceptance is purely voluntary. That statement is theoretically true, but practically it is wholly false. A banker, or large merchant or manufacturer, may be in a position, equipped with skilled men or expert information, to exercise discrimination between the strong and the weak banks. But what can the artisan, the day laborer, the miner, or the farmer know of such a matter? From the nature of their calling they can exercise no discrimination. They know, and they can only know, that the Government allows such bills to circulate, in form and semblance of money, and they have the right to hold the Government responsible that it be worth 100 cents on the dollar, whether it comes from New York or New Mexico.

"The Constitution of the United States prohibits the States from coining money or making anything except gold and silver legal tender. State bank bills could not become a legal tender. Neither are national bank bills. State bank bills when issued add just so much to the liabilities of the bank. They would circulate freely in times of prosperity and confidence. In times of monetary stringency and general distrust they would return to the banks for redemption. They would have to be redeemed in legal-tender money provided by Congress. Congress must, under the Constitution, provide all the money that possesses a full debt-paying power. By every consideration of sound business principles it should provide all the money that the country requires. No public interest can be served by dividing this function with the 44 States. Every period of financial depression in the past resulted in the suspension of specie payments, more or less general, by the banks; that is, resulted in the inability of the banks to redeem their notes. The same conditions would produce similar results in the future. If State bank notes are allowed to circulate, their acceptance is not voluntary; it becomes a business necessity. Many mine owners, manufacturers, and large employers of labor practised paying their help in store orders, in order to control their trade and make the extra profit. Surely, under the law, the acceptance or rejection of such orders was purely voluntary, and yet their acceptance for fear of losing their employment was general.

"So great did this abuse become, that many States have enacted laws compelling corporations to pay their laborers, at regular intervals, in money. The wealthy class could provide themselves with the means of discriminating against the notes of weak banks, and if they found themselves possessed of any, would proceed to work them off upon their less fortunate neighbors. That is the record of the past. It would be the experience of the future. To the average laboring man a bank-note reporter and detector would be as inexplicable as the binomial theorem. When a bank suspends, the fact that the note is secured and will be eventually paid is poor consolation to the laborer who needs his money for his daily use. The note of a failed national bank is as good as that of any bank in the system. The restoration of State-bank circulation portends disaster to that class of our citizens who most need and have most right to ask protection from the Government. State-bank circulation loses its money power in a crisis. It is a source of weakness, and adds to the danger. Instead of paying debts it comes forward itself to be paid."

And again, p. 11 :

"The national banks for a long series of years have demonstrated their ability to furnish the country with currency ample in amount, elastic in volume, sound beyond peradventure, and every dollar of which, every moment of its existence, was worth par throughout the length and breadth of an unwise experiment. It is proposed to restore State-bank circulation by removing the 10 per cent. tax imposed March 3, 1865. There is no fairer test of men or methods than the record they make for themselves. Every item of assets and liabilities, as shown by the trial balance of their general ledgers, of every national bank, for the whole period of their existence, has five times each year been published in the locality, reported to the Comptroller of the Currency, and become

Arguments for the National System.

a matter of record. Additional tables resolve all composite items into detail. Additional statistical tables complete the history and workings of such banks. Special reports show the course of trade and exchange. In case of failure, equally explicit information is obtained from receiver's reports, total claims, total assets, percentage paid, percentage of loss, items of expense, including receiver's fees and attorney's fees.

"All this information is annually reported to Congress and spread before the country. The course of trade, the material condition, the prosperity or depression of the country, are truthfully reflected in the condition of its banks. And the publication of the above conditions, in the reports of these banks, has been of inestimable value to publicists and economists. This is the record of national banks under Federal authority and Federal supervision. To compare the present national banking system with the old State banking system is to compare order with confusion—perfect system, under central control, with imperfect system, under diversified control. The banking systems of the different States, during the period that they were banks of issue, differed essentially. Some had excellent banking laws; others had very crude laws. Some had effective supervision, and some had none or worse than none. In no State was the aggregate or percentage of loss to note-holders of State banks reported, nor the losses to creditors or stockholders. The most careful research reveals only general statements, or estimates of loss, in the current financial literature of the time.

"Congress, by resolution in 1832, directed the Secretary of the Treasury to procure and publish statistics relating to banks in the several States. Such publication was made more or less complete, with the exception of some years, until 1864; then followed an interval until 1873, when the Comptroller of the Currency was directed to procure from official and other reliable sources and report to Congress information in relation to State banking institutions."

And still again, p. 13 :

"If the 44 States are to furnish the currency of the country, then we will have a chain of sovereignties furnishing our circulating medium, each with varying laws and varying supervision, and, like all chains, the system as a whole would be no stronger than its weakest link. Disorganized finance in one State would affect all. Argentine financial troubles precipitated the Barings failure at a time when this country was generally prosperous, and yet it produced a quasi panic in the United States and cast a cloud over the financial horizon of the whole world which has not yet fully disappeared. Banking is not a philanthropical business, and banks will not issue circulating notes unless it is profitable. Manifestly issuing notes would be most profitable where greatest latitude was allowed or greatest laxity prevailed, and with the circulation of any State discredited, or the particular banks of any State discredited, conservative bankers and conservative business men would have to discriminate against such bills.

"We all know the practical machinery employed to enforce such discrimination. Our State boundaries and commercial centers would be policed with brokers' offices, and commerce would be compelled to pause at State lines and pay the exchange demanded in order to provide itself with money acceptable in the locality where proposed business was to be done. The bill of a perfectly solvent bank in Oregon would be worth just as much less than its face in Chicago or New York as it would cost to send such bill to Oregon for redemption and secure the proceeds in return—cost of transmission each way and interest for the time required—in short, exchange. It would be precisely on a par with the note of any equally reputable business firm. The only way this discount could be avoided would be to provide for the redemption of such notes in Chicago, New York, Boston, and other money centers. Should interior and far Western banks make their bills worth par throughout the country by providing for their redemption at convenient money centers, it would compel them to keep an amount of idle reserve with their redemption agents that would seriously impair the profits on circulation. And the United States Government would not facilitate banking transactions then, as it does now, by receiving money at its sub-treasuries and transporting the same to any part of the country for the meager charge of 15 to 50 cents per \$1000."

Danger of a Currency furnished by State Banks.

Such is the main argument for the retention of the national banking system and the tax upon State banks of issue.

On the other hand is the argument that Congress has no right to take the privilege of issuing notes by a tax practically prohibitory. The Democratic national platform, therefore, representing the party of State rights, consistently put a plank into its platform repealing the tax :

"In Sec. 8 of Art. 1 of the Constitution of the United States, the powers which Congress shall have are enumerated, and as we read them over we look in vain for any one that in any terms confers upon that body the

power to take from the States authority to provide for a paper currency if by the Constitution it was left to them. **Opposition to State Bank Tax.** The power to incorporate banks and authorize the issue of currency by them, as we have seen, had been exercised for three quarters of a century before Congress undertook to interfere with it in

the manner specified. Even when a national bank was chartered, the State banks were left in existence; and it was not the State power but the national power, as exercised in the grant of the national charter, that was then seriously questioned. We must therefore take it as indisputable at the present time that the States had rightful power to charter banks as they for so long a time had done, and to authorize the issue of notes by them, to circulate as money. Among the powers granted to Congress, however, was the power 'to lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States.' This power, it is seen, is given in the most general terms, and the restrictions that are imposed upon it are only such as to insure uniformity, and they need not here be specified. A power thus conferred in general terms must necessarily rest in the discretion of the Congress, but it is expected to be exercised in harmony with the general features of the Constitution itself, and without any encroachment upon the undoubted rights of the States or of the people. The power to lay and collect taxes is a revenue power. It has for its object, as is here declared in the Constitution itself, 'to pay the debts and provide for the common defense and general welfare of the United States.'"

Now, this tax admittedly and unquestionably is not and was not expected to bring in revenue. Under the form of a tax it was avowedly simply a means to develop the national bank system at the expense of State banks. Hence, argue the opponents of the tax, it is unconstitutional. If the National Government, under pretext of taxation, can do what otherwise the Constitution gives it no power to do, it can go much further. Says T. M. Cooley :

"Great as is the federal power to tax, certain implied exemptions are indisputable. Congress cannot lay a tax upon the States, or upon their municipalities, or their offices, or their schools, or their other governmental instruments or agencies. If these could be taxed, the States themselves might be annihilated under the pretense of an exercise of the revenue power. But when the legitimacy of regulating local commerce and contracts by federal taxation shall be firmly established in the legislative mind, we may feel certain that occasions will not be wanting for partisan majorities in Congress to give frequent illustrations of the truth of the maxim that 'the power to tax is a power to destroy.'"

Again, it is argued that a State bank issue would be less free from danger at the hands of agitators, since, if they did get control of the legislation of one State, they would not be likely to of all State legislations at the same time; and so the whole national system would not be endangered as if all were under the control of one national body. The using of this argument at a time when the East fears what it considers the wild financial views of many of the Western States is of course to be expected.

But this leads us to notice, lastly, those who would do away altogether with the chartering of private banks by either State or nation as banks of issue. These argue that the present system gives enormous advantages to the favored few who have capital. They point out that under the present system any five rich men can loan the Government \$100,000, receive interest on the same without any serious risk to themselves, and yet, while receiving this interest on the whole

Radical Views of Banking.

\$100,000, can get \$90,000 of this to let out again at interest as a bank. They go on to argue that our whole banking and currency system since the war, if not before, has been controlled by the bankers of our great cities wholly in their own interests. They accuse them of first scheming to put limitations upon the Government issue so as to lessen its value, thus causing depreciation; secondly, of buying up this depreciated currency, and with it purchasing United States bonds at par, and then getting Congress to vote, under the pretense that honesty demanded it, of redeeming these bonds in gold (having sold them for paper); and, thirdly, on top of all this, of scheming to reduce the volume of the currency, and so to raise the value of the notes in their possession. The People's Party, therefore, all Socialists, Nationalists, Greenbackers, Knights of Labor, and many even who do not endorse the greenbackism and all the financial positions of the People's Party, would have all banking carried on by Government directly, without the intervention of private banks chartered by either State or nation as banks of issue. Professor Amasa Walker, Francis Bowen, and other economists are also opposed to such private banks. (For a fuller discussion, however, of this position and the argument for it, see GREENBACKISM; CURRENCY; PEOPLE'S PARTY; PAPER MONEY, etc.) The philosophical anarchists and extreme individualists, on the other hand, would abolish the present system by putting no dependence upon Government, but substituting mutual banks. (See MUTUAL BANKS.) Others, who do not go so far as either of the above extremes, would have simply a Government postal bank system (*q.v.*) or land banks, as in Germany. (See LAND BANKS.) Says Mr. B. S. Heath, who is a fair example of those who would most radically change the present banking system, in his *Labor and Financial Revolution*, p. 144 :

"Viewed in its true light, is not the national banking system a long step toward the establishment of sovereignty based upon hereditary succession; is it not a big block wrenched from the temple of liberty and planted as the corner-stone of imperialism, a powerful element of sovereignty crowned with the divine right of kings?"

"As the federal Government possesses no powers except such as were delegated to it by the people and enumerated in the Constitution, was not the bank act, conferring and perpetuating delegated powers upon foreigners and aliens, a gross betrayal of trust, if not treason against the people?"

"Has the Government a constitutional right to delegate powers entrusted to it, especially to be exercised by it for the people?"

"If not, is the national bank act a palpable violation of the Constitution, and its enforcement a usurpation of power not warranted by that instrument?"

"If the Government chooses to farm out its control over the currency to private parties, why not grant the privilege to those who need it in the production of

wealth, instead of giving it to an idle monopoly to rob, blackmail, and oppress the producers of wealth?"

Such are the various views of those who in different ways would modify or overthrow the present banking system. (For a discussion of the economical questions involved, see MONEY.)

The approximations in the table of Banking Statistics of Principal Countries of the World are by Mulhall, 1890.

BAPTISTS IN RELATION TO SOCIAL REFORM.—In reviewing the relation of Baptists to social reforms, it is to be borne in mind that they do not constitute an organic body capable of giving a united authoritative expression

of opinion on either social or religious matters, or of taking formal and concerted action thereon. While exhibiting a remarkable unity of doctrine and polity, they are, nevertheless, simply local societies, self-governing and independ-

dent of one another. Indeed, to the sociologist this initial statement is one of deep interest, as these local societies were, in the times of the reformatory movements of the sixteenth century, already existing as free socialistic communities, and as such are deserving of the investigation of the social reformer. Mr. Richard Heath, in an article in the *Contemporary Review*, has clearly shown this fact. These societies have never completely lost the early social leaven, and in all times there have been among them earnest and able advocates of social, political, and religious liberty, contending for the separation of Church and State, liberty of conscience, government by consent of the governed, the kingdom of God on earth, and the inner light and teaching of the Divine Spirit. Baptists have, therefore, naturally affiliated themselves with the radical party in social and religious affairs. And yet this same love of individual liberty and a jealousy of autocratic external control have prevented the manifestation of this progressive spirit in the erection of great institutions or the promulgation of authoritative creeds. Perhaps, aside from individual expressions of this liberty-loving spirit, the widest influence which Baptists have exerted has been in a socialistic and missionary propaganda. Missionary zeal has ever been conspicuous among them both in home and

Missionary and Socialistic Propaganda. In the modern missionary movement, William Carey and Adoniram Judson are conceded to rank among the foremost pioneers. In political revolutions they have been usually found on the liberal side, and many of the leaders have been drawn from among them. In the anti-slavery movement they took an early and decisive position, while in the Revolution they were, almost to a man, on the patriot side; and in a still earlier day Roger Williams was the first great apostle of religious liberty.

The recent social discussions have naturally awakened the interest of Baptists. In the Baptist Congress reports, almost from its commencement, in 1882, a prominent place has been accorded to social topics, and able contributions will be found in them to the solution of these questions. In the proceedings of the missionary annual meetings, which are the only general gatherings of Baptists of a national character, as well as in State conventions and local associations, social opinions of an advanced type on temperance, slavery, negro and Indian education, etc., have found expression in resolutions and memorials intended for transmission to Congress or State legislatures.

The *Baptist Congress* was instituted in November, 1882, by several clergymen and laymen "for the discussion of current questions," and has proved a very useful and efficient organization. Its inception is credited to Professor E. H. Johnson, D.D., of Crozer Theological Seminary, Upland, Pa. It is modeled after the plan of the *Church Congress*, and is the only similar body in the country. Its first president was Rev. George Dana Boardman, D.D., of Philadelphia. The first meeting was held in Brooklyn, and it has held annual meetings since. The last meeting was held in December, 1893,

in Augusta, Ga. The proceedings of the Congress are published annually.

The purpose of the Congress is to afford an opportunity for the full, free, and courteous discussion of social and religious topics. No action is taken of any kind. It is simply a free platform for debate.

In 1889 a few of the younger Baptist ministers in the vicinity of New York commenced a paper called *For the Right*, devoted to Christian socialism. It was published for 18 months, and then discontinued for lack of financial support. The first editors of this paper were Rev. J. E. Raymond, Rev. Walter Rauschenbusch, Miss Elizabeth Post, and Rev. Leighton Williams. In December, 1892, a conference of Baptist ministers interested in social topics met in Philadelphia and formed an undenominational society known as the Brotherhood of the Kingdom, to be devoted to the study and propaganda of the social teachings and gospel of Jesus Christ. Rev. Samuel Lane Batten, now (1895) associate pastor of Amity Church, New York, is the secretary and only officer of the Brotherhood. In August, 1893, the Brotherhood held a three days' conference at Marlborough-on-the-Hudson, discussing various aspects of the doctrine of the Kingdom of God, with a view to the publication of a volume of essays on the subject. Similar conferences have been held yearly since. (See BROTHERHOOD OF THE KINGDOM.)

Perhaps the considerations already stated may explain the small number of Baptist churches which have as yet sought to exemplify the social aspects of the Gospel in the various appliances and applications now becoming common. Yet the "institutional Church," as it is coming to be called, is by no means unknown among Baptists. The Grace Temple Church, in Philadelphia, of which Dr. Russell H. Conwell is pastor, is well known throughout the country for its splendid work in popular education. The old Spruce "Institution-Street Church, in the same city, is **isal Churches.**" conspicuous in work along similar lines. In New York, the Tabernacle Church was the first to launch out in these directions. It has since been followed by the Memorial Church and Amity Church. The last named has made a new departure in opening its new hall for a series of conferences on municipal government which have met with considerable popular favor.

Mention should be made also in this article of the advanced stand which many of the Baptist preachers and authors have taken on social topics. Dr. Francis Wayland and Dr. Martin B. Anderson exerted as educators a profound influence during the anti-slavery agitation and the Civil War, as did also Dr. William R. Williams by his sermons. Many others might be mentioned did space permit. Among our denominational papers, the *National Baptist* has been conspicuous for its outspoken attitude on social topics. The editor, Dr. H. L. Wayland, and his brother, Hon. Francis Wayland, of Yale College, have long been prominent in the Social Science Association.

In conclusion, it may be said that as yet the relation of Baptists to social reform is not so important for any distinct contribution that they

have made to its literature or to its institutions as for the illustration which their own historical descent and present condition affords of the possibility, permanence, and prosperity of self-governing, self-perpetuating social communities. They early built upon principles in the religious sphere which have since been embodied in our political constitution, and are yet to be realized in a new *social régime*.

LEIGHTON WILLIAMS.

BARNETT, Rev. SAMUEL A., rector (1895) of St. Jude's, Whitechapel, East London. Mr. Barnett was born in 1844, and was educated at Wadham College, Oxford. About 1872 he became vicar of St. Jude's Church, and commenced his faithful and untiring labors. In 1883 he went to Oxford and presented to a little knot of students gathered in a student's room a plan for a settlement of university men to live and work among the poor. A small settlement of five men was made. Then Cambridge University joined with them, and in January, 1885, Toynbee Hall (*q. v.*) was commenced, with Mr. Barnett as warden. It was named for Arnold Toynbee (*q. v.*), the brilliant young student who had previously gone to live among the poor, but who had died (1883). Mr. Barnett's central thought was that all true uplifting for the poor must come from life, and from brother-life. "Vain," he said, "will be higher education, music, art, or even the Gospel, unless they come clothed in the *life* of brother-men." He and his wife, Henrietta O. Barnett, have been the authors of many essays and papers on various portions of the social problem, which have been collected into a most readable and suggestive book called *Practicable Socialism*. Some of his more fundamental positions are as follows:

"The social reformer must go alongside the Christian missionary, if he be not himself the Christian missionary" (p. 195).

"The one satisfactory method of social reform is that which tends to make more common the good things which wealth has gained for the few. The nationalization of luxury must be the object of social reformers" (p. 65).

"The first practical work is to rouse the town councils to the sense of their powers; to make them feel that their reason of being is not political, but social; that their duty is not to protect the pockets of the rich, but to save the people. The care of the people is the care of the community and not of any philanthropic section" (p. 72).

"Societies which absorb much wealth and which relieve their subscribers of their responsibility are failing; it remains only to adopt the principle of the education act, of the poor law and of other socialistic legislation, and call on society to do what societies fail to do. There is much which may be urged in favor of such a course. It is only society, or, to use the title by which society expresses itself in towns, it is only town councils (*i. e.*, city councils) which can cover all the ground and see that each locality gets equal treatment. It is by common action that a healthy spirit becomes common, and the tone of public opinion may be more healthy when the town council engages in good doing than when good doing is the monopoly of individuals

or of societies. If nations have been ennobled by wars undertaken against an enemy, towns may be ennobled by works undertaken against the evils of poverty" (p. 66).

It is not easy shortly to answer the question, "What is Toynbee Hall?" It is not enough to say that it is the center of education, where every week some thousand students meet. Neither is it enough to say it is a club of university men associated to promote the common good. It has rather become a name under which a society holds together, formed of members of all classes, creeds and opinion, with the aim of trying to pass on to East London the best gifts of the age. Toynbee Hall, too, has not been made, it has grown; and it is no exaggeration but bare justice to say that its growth to the present splendid proportions is in very large measure due to its devoted warden, Mr. Barnett.

But even here Mr. Barnett's social efforts have not ceased. He has been and is still associated with almost innumerable movements for the benefit of the poor. As a member of the Whitechapel Board of Guardians he has taken great interest in the reform of poor law administration, and the esteem in which he is held was recently proved by his election to the chairmanship of the Board. He is also chairman of the Children's Country Holiday Fund. He aided very materially in the establishment of the Free Library in Whitechapel, and is one of the commissioners for that part of London. He is also actively connected with the Metropolitan Association for Befriending Young Servants, with the Charity Organization Society, the School Board, the Teachers' University Association, and the London Society for the Extension of University Teaching.

BARTER is the act or practice of trafficking by exchange of commodities. (For a discussion of the monetary questions involved, see articles on CURRENCY and MONEY.)

BASCOM, JOHN, born in Genoa, N. Y., May 1, 1827, graduated at Williams, 1849, and at Andover Theological Seminary, 1855; was tutor at Williams College from 1852-53, and from 1855-74 Professor of Rhetoric there. From 1874-87 he was President of Wisconsin University and Professor of Mental and Moral Philosophy. He is now Professor of Political Science in Williams College. His principal works are *Political Economy* (1859); *Aesthetics* (1862); *Philosophy of Rhetoric* (1865); *Science of Mind* (1869); *Philosophy of Religion* (1872); *Philosophy of English Literature* (1874); *Ethics* (1879); *Natural Theology* (1880); *Comparative Psychology* (1878); *Problems in Philosophy* (1885); *Sociology* (1887); *Words of Christ* (1885); *New Theology* (1891); *An Historical Interpretation of Philosophy* (1893); *Social Science* (1895). He has also written extensively for the quarterly press, on various reform topics—prohibition, labor reform, etc.

BASTIAT, FRÉDÉRIC (1801-50), born at Mugron, near Bayonne, France, was the son of a merchant in the Spanish trade, and was left an orphan at the age of nine. He commenced

active life in the establishment of his uncle ; then he tried farming at Mugron ; next was made, after the Revolution of 1830, *judge de paix* of his canton. His first pamphlets were little memoirs on local subjects ; but he became interested in English writing on political economy, and it seems to have awakened him to new powers. He wrote his *Sophismes Économiques* and acquired popularity and recognition. He soon became the most dreaded foe of protection, and was a friend of the great Cobden. An *Association pour la Liberté des Échanges* was formed at Bordeaux and another at Paris, with Bastiat as secretary. He was turned aside from his battle for free trade by the Revolution of 1848, when he turned his shafts of wit and French epigram against the socialists, and even more against Proudhon. He was elected to the Assembly of 1848-49, but spoke little, being mainly engaged on his great work, his *Harmonies*, the first volume of which only was published before he died in Italy. "In this brilliant work," says M. de Forille, in the article upon Bastiat in Palgrave's *Dictionary of Political Economy*, "unhappily never finished, Bastiat shows the contrast between the internal weakness of the artificial organizations which are founded on constraint, and the prosperity spontaneously arising in an economic condition in which the equilibrium of individual and collective forces results from their free and reciprocal balance. This is the fundamental thought (*idée mère*) on which the *Harmonies Économiques* are based, and granted this as a philosophic basis, it could not have been developed with more skill. (See Palgrave's *Dictionary of Political Economy*.)

BATHS (Public).—Public baths were considered a necessary feature of all ancient cities. We read of a public swimming bath in Rome 312 B.C., and that at one time Rome had 856 public baths, using annually 400,000,000 gallons of water. In the Middle Ages nearly every village and town is said to have had its bath-room with wooden tubs. To-day in Turkey and in Japan, and in almost all Eastern countries, public baths are found accessible to the poorest classes on payment of a very slight fee. The movement to start public baths in modern Western cities is, however, of recent date, the first being established in Liverpool in 1842. In 1844 an Association for Promoting Cleanliness Among the People was formed in London, and in 1846 Parliament passed an act permitting municipal and local authorities to establish public baths and laundries at low prices. Birmingham first moved. Says Mr. Albert Shaw, in his *Municipal Government in Great Britain* (p. 187) :

"It was in 1851 that the first establishment was completed and opened at a cost of about \$120,000. Its popularity was immediate, and it was patronized by 100,000 bathers a year. In 1860 a second establishment was opened, followed by a third one in 1862. The bathers soon averaged 200,000 a year, and gradually increased to 300,000. In 1863 a fourth great establishment was opened, and the bathers at once increased to 400,000. These are, of course, in perennial use, and artificially warmed in winter. But the committee also provides open-air summer baths in two or three of the parks. The school-children of Birmingham have the pleasure and benefit of splendid swimming-baths the year around, at the price of a halfpenny for each bath. Citizens who wish to pay for Turkish baths find them

provided at a shilling. It is not attempted to make these establishments fully self-sustaining. The running expenses of the system are more than \$35,000 a year, and the receipts from bathers are less than \$30,000. The city, moreover, has interest to pay on an investment of \$350,000. But when the benefits to school-children alone—not to mention the hosts of young working men and women—are considered, the net charge against the rates is a trifling matter for a rich city of half a million people."

From the same source we learn that public baths exist in Sheffield, Huddersfield, Halifax, Birkenhead, Hanley, Bolton, Leicester, Plymouth, Kidderminster, Oldham, and Coventry. Salford has four public baths established at a cost of \$200,000. Nottingham has greater bathing facilities in proportion to its size than any town in England. Liverpool has now seven public baths at a cost of perhaps \$800,000. Manchester since 1880 has opened eight baths, costing nearly \$1000 apiece, and connected with each is a public gymnasium. London, long deficient, is now moving rapidly in multiplying baths. Of Glasgow's public baths Mr. Shaw says :

"There are now five large establishments in different parts of the city, the first of which was opened in 1878 and the last in 1884. Each includes under the same roof very capacious swimming-baths for men and for women and numerous small bath-rooms, every modern facility being provided ; and also, as a distinct feature, an elaborate and extensive wash-house for the use of poor families that lack home conveniences for laundry work. The substantial character of these institutions will appear when I state the fact that, altho honestly and economically built, they have cost more than \$600,000.

"The swimming-baths are kept open through the entire year, at a uniform temperature, and the pure and soft Loch Katrine water makes them particularly inviting. Their establishment was an inestimable boon to the working classes, who needed them as a common decency of life, and who enjoy them as a luxury. They are in charge of competent swimming-masters, and there are swimming-clubs and frequent contests in connection with each of them. Glasgow affords the masses so little healthful recreation comparatively that this feature of the baths is the more appreciated. The number of bathers exceeds 450,000 a year, and there is reason to believe that it will increase, altho the present average of 1500 per day the entire year through would seem to justify the city's outlay. The charges are, of course, small—twopence for use of swimming-bath and a little more for the private baths, with special rates for school-children."

France, Belgium, and Austria have kept pace with this movement. Berlin had 12 public baths up to 1893, and that year another was erected at a cost of \$150,300.

In the United States very little has been done, and that by private societies. In 1891 the New York Association for Improving the Condition of the Poor opened a People's Bath at 9 Centre Market Place. Mr. F. S. Longworth, the general agent of that society, gives the following summary of the work to April 1, 1894 :

Date of opening bath-house :	August 17, 1891.
Cost of bath-house, exclusive of value of lot.	\$27,025.58
Cost of operations for one year, at five cents each for baths, beyond receipts from bathers.	1,840.76
Total number of bathers from date of opening to March 31, 1894, two years and seven months: 164,166 ; namely,	
Men	120,780
Women	19,847
Children	15,710
Children free	7,829
Total	164,166

Greatest number of bathers in one day	932
Number bathed per month per whole year	5,295
Greatest number per month	13,095
Average number per day bathed in winter months	140

In a paper read at a municipal conference in New York, April 26, 1894, Mr. John P. Faure says :

"Just one week later than the Association for Improving the Condition of the Poor, or on August 24, 1891, the managers of the DeMilt Dispensary opened a bathing department in the basement of their building, corner Second Avenue and Twenty-third Street, equipped with one tub and four sprays.

"For the first year a charge of 10 cents per bath was made, including a fresh towel and small cake of soap for each bather; since August 1, 1892, however, the price has been reduced to five cents.

"During the two and one half years since the opening of these baths, they have been used by about 5000 bathers.

"That this number of people, residing in different portions of the city from Centre Market Place, should manifest the same desire to bathe and pay for it, only confirms the opinion expressed earlier in this paper.

"On November 27, 1893, the Charity Organization Society opened its model bath-house, representing the latest known improvements in sanitary plumbing, at its 'Wayfarers' Lodge,' 515 West Twenty-eighth Street.

"I quote from a recent letter of my friend Mr. Charles D. Kellogg, the founder of the Charity Organization Society in this city, in which he says: 'The baths at our lodge are not free by any means. Every man who goes there to remain over night and be fed is compelled to take a bath and to have his clothes fumigated, in addition to a certain extent of labor. In our judgment it is a better plan for the class of men with whom we deal, that is, homeless and unemployed—the city tramp properly—than any plan of free baths.'

"During the months of December, January, February, and March bathing possibilities were afforded to 8773 men by the latest work of a society that has done so much to educate New York as to the wisest lines on which to administer its benefactions."

The only baths provided by American municipalities are a few floating swimming-baths. In this New York has led. Two free floating-baths were authorized by the New York Legislature in 1868, and up to 1889 10 more, and in that year nine more. Only 15, however, have been built. An act of 1892 in that State authorizes "any city, village, or town in this State to establish public baths, and to loan its credit or make appropriations for that purpose."

Other States are far behind even this.

References: *A Plea for Public Baths*, by Dr. Simon Baruch, New York Academy of Medicine (1891, 1892); *Les Bains Populaires*, by R. Baumann (Paris, 1892); *Public Baths as a Preventative of Disease*, by C. H. Shepard (*International Medical Magazine*, 1892).

BÄUMELER, JOSEPH, the first head or leader of the Separatists, who in 1818 founded the communistic colony of Zoar (*q.v.*). Originally a weaver, and later a teacher, he seems to have been a man of unusual organizing ability, a fluent speaker and natural leader. The community was at first celibate, but between 1829-30 they began to permit marriage, and Bäumeler himself took a wife. Under his lead the community prospered greatly, and when Bäumeler died in 1837 the loss was said to be almost irreparable to the community. (For his views, see ZOAR.)

BAX, ERNEST BELFORT, was born July 23, 1854, at Warrington, Warwickshire, altho his family was originally of Surrey. His first interest in social problems dates from the Paris Commune of 1871, when he was led to study the

whole economic question, with its social, political, and ethical bearings. He subsequently studied in South Germany, and later became assistant correspondent in Berlin for a prominent London daily paper. In 1882-83 he was one of the inaugurators of the English socialist movement, in conjunction with his friends, Hyndman, Morris, and others. At the beginning of 1885 he left the Social Democratic Federation in company with Mr. Morris and others, and founded the Socialist League, starting and editing with Mr. Morris a new journal, the *Commonweal*. The League had a prosperous career for two or three years, when the anarchist element in it became predominant, and he resigned in consequence. Subsequent to this he has taken part with the Federation in various ways, editing for a time *Justice*, the organ of the Social Democratic Federation, and helping to found the new *Twentieth Century Press*. He has been a frequent contributor to the literature of the party, and is the author of the following works: *The Life of Murat* (out of print); Kant's *Prolegomena and Metaphysical Foundations of Natural Science*, translated into English, with introductions and notes; *Handbook of the History of Philosophy from Thales to the Present Time*; an edition of Adam Smith's *Wealth of Nations* (with introduction and notes); Schopenhauer's *Essays* translated into English, with biography, introduction and notes; *The Religion of Socialism*, being Essays in Modern Socialist Criticism; *The Ethics of Socialism, etc.*; *Outlooks from the New Standpoint*; *The Story of the French Revolution*; *The Problem of Relief*, being suggestions for a philosophical reconstruction; *Socialism: Its Growth and Outcome* (Morris and Bax). He has been the editor of two magazines (*To-day and Time*), both of which are now defunct; and he has at this time (1895) in the press a work dealing with the social side of the Reformation of Germany.

BAZARD, SAINT-AMAND (1791-1832). Born in Paris, he won the Cross of the Legion of Honor for the part he took in the defense of Paris (1813). He had a good position in the Prefecture of the Seine, but becoming interested in the efforts for democratic freedom, he went to the south of France and took part in the efforts of the Carbonari. Returning to Paris, he joined the Saint Simonian School, and became its leading economist and editor of its journals, *Producteur* (1829) and the *Globe* (1831). He advocated compulsory free education, and the gratuitous giving by the State of land and capital for life tenancy *only* (so as to prevent accumulation), the State to give to each his deeds and to receive from each according to ability. In 1828 he gave, in Paris, a long course of lectures which largely made Saint Simonianism popular. In 1831 he opposed *Enfantin (q.v.)*, his colleague, at the head of the Saint Simonian school, on the question of marriage and divorce, and died of a broken heart at the division of the school. His main work is *Exposition de la Doctrine de Saint Simon* (1830-31).

BEAR.—In exchanges (1) one who sells stocks, grain, provisions, or other commodities neither

owned nor possessed by him at the time of selling them, but which he expects to buy at a lower price before the time fixed for making the delivery; (2) one who endeavors to bring down prices in order that he may buy cheap—opposed to a *bull*, who tries to raise the price that he may sell dear; (3) stock which one contracts to deliver at a future date, tho not in the possession of the seller at the time the contract is made. In the phrases "to buy or sell the bear," the expression is derived by some from the proverb, "to sell a bear's skin before one has caught the bear." One who sold stocks in this way was formerly called a "bearskin jobber," later simply "a bear;" explained by others as an allusion to a bear, which pulls down with its paws, in contrast with the bull, which tosses up with its horns.

BEBEL, FERDINAND AUGUST, was born on February 22, 1840, near Cologne, and was educated as a turner. He passed through the usual grades of apprenticeship and journey-manship, and after his *Wanderjahre*, spent in South Germany, he established himself in 1860 at Leipzig. His first public activity was as an upholder of Schultz-Delitzsch's cooperative movement, to which Lasalle also at first adhered, and he became prominent in political and educational work among working men. He threw all his influence against Lasalle and the Universal Association when the latter was founded.

But Bebel was soon to come under the influence of Liebknecht, and to become a socialist. He had no sympathy with socialism up to 1866, but from that time his views rapidly changed. He joined the International, becoming influential enough to take a prominent part in bringing together the followers of Marx and Lasalle, and so helping to make the Social Democratic Party. When he was elected President of the Union of German Working Men's Associations in 1867, he persuaded the organization to unite with the International—at the time an important step in the movement toward socialism.

Bebel was returned to the North German Diet by a Saxon constituency in 1867, and has remained in the German Imperial Parliament, with brief exceptions, ever since, altho an outspoken socialist. He has often been imprisoned; first in 1869 on the charge of disseminating doctrines dangerous to the State; again in 1870 on a charge of high treason, and lastly in 1872, when he was sentenced to two years' imprisonment. Later, two additions of nine months each were made to this sentence.

Bebel and Liebknecht were the leaders of social democracy in the German elections of June, 1893, in which it made such a striking and significant advance, and they remain to-day (1895) the two main teachers and leaders of German socialism. Bebel once summarized his views thus: "We aim in the domain of politics at republicanism, in the domain of economics at socialism, in the domain of what is called today religion at atheism." His main writings are *Frau und der Socialismus* (1879); *Unsere Ziele* (1876); *Christenthum und Socialismus*; *Zur Lage der Arbeiter in den Bäckereien* (1890).

BECCARIA, CESARE BONESANA, Marquis (1735-93), was born at Milan and educated at a Jesuit college at Parma. He was an able mathematician and an expert in many sciences. He belonged for 25 years to the magistracy, serving under the Austrians, who in 1768 formed for him a Chair of Political Economy in Milan—the second of the kind in Italy. His famous little tract, *Dei delitti e delle pene*, has been translated into 22 languages. Before either of them he arrived at many of the conclusions of Adam Smith and of Malthus. He is also the author of the famous phrase, "The greatest happiness of the greatest number." He asserted that "coldly (rigidly) examining human nature, we see that every man is absolutely *egotistic*, and that on this basis alone legislation can be established if it is not to be knocked over constantly; that nobody cares anything for the universal happiness or for the good of others, and that every man makes himself the center of all the things that happen in the world." Helvetius taught that "interest is for the moral world what the principle of gravitation is for the physical one," and he seems largely to have influenced Beccaria.

BEECHER, HENRY WARD, clergyman, was born in Litchfield, Conn., June 24, 1813; died in Brooklyn, N. Y., March 3, 1887. He was the eighth son of Lyman Beecher and Roxanna Foote; studied at the Boston Law School; was graduated at Amherst in 1837; studied theology at Lane Seminary. In 1839 he married Miss Eunice White Bullard, and entered upon his first settlement, which was over the Lawrenceburg, Ind., Presbyterian Church. In 1839 he went to Indianapolis, and served the Second Presbyterian Church of that place for eight years. In 1847 he accepted an invitation to become pastor of the Plymouth Congregational Church, Brooklyn, N. Y. This society had just been formed by a few leading men especially interested in temperance, the new school theology, anti-slavery, and other questions of reform. He labored with this people until his death, which terminated a pastorate of 40 years. As a preacher and reformer he had world-wide fame and influence. In 1855 he introduced a new order of church music by his *Plymouth Collection of Hymns*. At about this time his society was the first to connect parlors and a kitchen with a place of worship. In the Plymouth pastor the oppressed ever found a champion for their cause. On his platform in *antebellum* days stood Frederick Douglas, the black man, pleading for his race. Here often appeared fugitive slaves whose freedom Mr. Beecher purchased with the contributions of his congregation. Here Wendell Phillips, the abolitionist, was invited to voice his convictions when driven by mobs from the halls of New York City. Here Kossuth, the exile, pleaded for his people, and \$10,000 were raised for the freedom of Hungary. Here Mr. Beecher was confronted by a fierce mob which attempted to "clean out the nigger-worshiper." In 1850, in his famous star paper, *Shall We Compromise?* in *The Independent*, he vigorously opposed the policy of Webster and Clay to save the Union by moral compromise.

Mr. Beecher resolutely repudiated the justice of the fugitive slave clauses in Clay's bill, and the obligation of capturing and returning runaway slaves. For this he was lampooned by the press. In 1857, when the Dred-Scott decision of the United States Supreme Court had given slave-holders right to take their slaves into any part of the Union, and the South was attempting to force slavery upon Kansas, the newly settled State, he opposed the movement by lecturing extensively and collecting money for the purchase of Bibles and rifles for the settlers. He did much in shaping the course of the Republican Party as a new political force. He was in close conference with Horace Greeley and Henry J. Raymond, editors of the New York *Tribune* and the New York *Times*, the leading Republican journals of those days. He was for 20 years an influential contributor to *The Independent*, of which paper he was editor during the Rebellion (1861-63). In 1856 he stumped for Fremont, and in 1860 for Lincoln. In 1863 he visited Great Britain, and there vindicated his national Government. He spoke in several of its principal cities, where sympathy for the confederacy prevailed. His life was threatened, and the press denounced him. The walls of the cities were placarded with enormous scurrilous posters, and handbills of malcontent were freely distributed. Copies of these bills are now preserved in the Brooklyn Historical Society. He confronted vast, turbulent mobs, often contending with them for an hour or more before they would listen to his argument. Once he reached the platform only by being carried over the heads of the dense crowd. But by his good humor, pluck, and eloquence, he converted them to Northern principles. These addresses were published in 1864 in London as *Speeches on the Rebellion*. On April 14, 1865, by invitation of the United States Government, he delivered an oration at the commemoration of the fall of Fort Sumter and the raising of the national flag over its walls. In 1866 he wrote his famous letter to the National Convention of Soldiers and Sailors at Cleveland, O., wherein he condemned the exclusion of the Southern States, and advocated their readmission at once, showing that delay imperilled national peace and increased Southern bitterness. Tho a formidable opponent of the Southern policy, after the war he manifested great tolerance and compassion for the defeated States and their leaders. In 1870 he became the editor-in-chief of the *Christian Union*. In 1871-74 he delivered the first three annual courses of lectures upon preaching in the Lyman Beecher lectureship at Yale Divinity School. In 1874 he was charged with criminality with Mrs. Tilton by her husband, Theodore Tilton, his successor as editor of *The Independent*. After a thorough investigation by his church, the charges were not sustained; a trial of six months in the civil courts resulted in a divided jury, which stood nine for the defendant and three for the plaintiff.

His Political Activities.

Tho he had spoken for Presidents Grant, Hayes, and Garfield, he regarded the Republican Party as having performed its chief mission in the emancipation of the slave and the restoration of

the Union. His free-trade principles, his personal esteem for Governor Cleveland, and his distrust of Senator Blaine caused him to transfer his support, in 1884, to the Democratic Party. He was a conscientious and unpartisan thinker. He served his nation not as a statesman nor as a politician, but as an unselfish patriot and reformer.

He was stout in build, florid, and had a constitution of great endurance. His face was expressive and his voice magnetic. He had an exuberant imagination and a remarkable gift for illustration. His sermons and addresses abounded in references to nature, the arts, and common life. In disposition he was tolerant and affectionate; in theology, liberal and practical. He had an ardent affection for children. He was the most widely reported and misreported man of his generation. Through his voice and pen he had the widest influence of any preacher in America. His audience was generally limited by the capacity of the room in which he spoke. On the day of his funeral the Legislature of New York adjourned after passing resolutions of sorrow and esteem. A statue of Mr. Beecher was unveiled in Brooklyn, N. Y., June 21, 1891, people of all classes and ages contributing to a sum of \$35,000 for its erection. His body was buried in Greenwood Cemetery.

Publications containing his sermons, addresses and contributions to the press are numerous, the following of which are helpful for a study of his life as a reformer: *Star Papers* (2 vols.); *Lectures to Young Men*; *Lectures upon Preaching*; *Patriotic Addresses*; *Evolution and Religion*; *Plymouth Pulpit Sermons*. The most satisfactory biographies of Beecher are written by John Henry Barrows, Abbott and Halliday, W. C. Beecher and Samuel Scoville, Joseph Howard, Jr., and Thomas W. Knox. Valuable information upon his life may be obtained also in *History of Plymouth Church*, by Noyes L. Thompson; *The Beecher Memorial*, compiled and edited by E. W. Bok; Mrs. Stowe's *Men of Our Times*; Joseph Parker's *Eulogy of Beecher*.
THOMAS A. BICKFORD.

BEESELY, EDWARD SPENCER, born in 1831, was educated, like so many of the English Positivists, at Wadham College, Oxford. He became, in 1854, Assistant Master of Marlborough College, and in 1860 Professor of History in University College, London. Besides numerous magazine articles from the Positivist position, he has taken a large part in a translation of Comte's work, and is widely known for his lectures on Catiline, Clodius, and Tiberius. He has been a lifelong worker in the English labor movement as an uncompromising Radical. He presided at the meeting in St. Martin's Hall in 1863, when the International (*q.v.*) was organized, and was an original member of the Social Democratic Federation, tho he soon withdrew from the organization. He was more active, together with Frederic Harrison and other Positivists, in aiding in every way the trade-union movement in the days when the trade-unions were struggling for legal existence. He

was a constant contributor to the *Beehive*, which was from 1861-77 the powerful working-class organ in London. Some of his letters in defense of trade-unions nearly cost him his position of professor. He was, down to 1881, in close contact with the leaders of the trade-union movement, and aiding them constantly by his advice and his letters to the press. After 1883 the connection ended, altho there was no breach of friendliness. The need of his aid had largely ceased. (See TRADE-UNIONS, Section "England.")

BELGIUM AND SOCIAL REFORM.

I. STATISTICAL AND HISTORICAL.

The kingdom of Belgium was formed in 1830 as an independent State out of a portion of the Netherlands. Prince Leopold, of Saxe-Coburg, was elected king in 1831. With an area of only 11,373 square miles, it had, in 1893, a population of 6,262,272, making it the most densely populated country in the world. It is estimated that about 426,000 are engaged in agriculture, 293,000 in mines and metal works, 473,000 in mixed industries, 327,000 in commerce, 659,000 in professions and official positions. There were, in 1892, 35 royal colleges and atheneums, 131 middle schools, 57 industrial schools, 5797 primary, 1237 infant, and 1649 adult schools. Besides the public schools there were 80 private colleges, 65 private middle-class schools, and many lesser ones. In 1890, 26.9 per cent. of the population over 15 could not both read and write. Almost the whole population is nominally Roman Catholic, though the opposition to the "clericals" is rapidly growing. Full religious liberty is guaranteed by the Constitution. The Budget grants 4,800,000 frs. to Roman Catholics, 85,000 frs. to Protestants, and 16,300 frs. to Jews.

The revenue for 1892 was 414,045,000 frs. The Budget for 1895 estimates the ordinary revenue at 357,727,028 frs. (161,687,300 frs. from railways, post and telegraph; 51,905,000 frs. from direct taxes; 25,840,570 frs. from customs; 42,247,409 frs. from excise). It estimates the ordinary expenses at 356,193,486 frs. (109,790,484 frs. interest and sinking fund for the public debt, 106,525,589 frs. for ministry of railways, post and telegraph; 47,229,652 frs. for ministry of war).

The public debt in 1893 was 2,147,460,574 frs.; the funded debt, 2,126,050,939 frs. The debt was largely incurred for building railroads, but the interest is more than covered by the returns. The peace effective of the army is 47,642 men and 3421 officers; 29,191 workmen in 1893 were employed in 1559 quarries, 1804 workmen in metallic mines, and 116,861 (of which 2172 were women, 6359 were boys, and 44 were girls) worked in coal-mines under ground.

The imports in 1893 were 2,810,709,742 frs., and the exports 2,590,261,736 frs. January 1, 1894, there were 2018 miles of railway worked by the State—792 by private companies. Up to 1894 the State had spent for railways 1,941,283,473 frs. on first cost, 1,859,469,465 frs. on working them, and up to 1893 the total receipts have been 3,170,642,149 frs.

II. SOCIAL REFORM.

Social and industrial reform ideas began to

work in Belgium very early in the century. According to M. Vandervelde, Belgian trade-unions are developed from old trade benefit societies which arose toward the end of the eighteenth century after the abolition of the old medieval guilds in 1795. Thus, for example, the Hat-makers' Benevolent Union was originally a trade friendly society, but became in 1838 "a society for the maintenance of prices and for resistance." Even down to the second half of the century the old spirit lingered. In 1867 the weavers at Ghent still bore on their banner the motto, "God and the Law" (*God en de Wit*). To-day the Belgian artisan cries, "Down with the bishop" quite as much as "Down with the king."

The Master Glass-workers' Association at Charleroi was established in 1836; the Free Typographical Association originated in 1842; the Jewellers' and Goldsmiths' Society in 1852. The trade-union movement in Belgium, however, early took a socialistic form.

As early as 1835 the Belgian Colins wrote in Paris his *Le Pacte Social*, advocating extreme collectivism, and arguing that "immovable property belongs to all." In 1848, at Ghent, Huet gathered around him a little knot of liberal Catholics, among them his distinguished pupil, Professor E. de Laveleye, and taught them the principles which at a later day he so eloquently embodied in his *Le Règne Social du Christianisme*, a book which Laveleye says "has not met the attention which it deserves, only because it is too full of Christianity for socialists and too full of socialism for Christians."

More radical socialism was, however, to come to the front in Belgium. When Karl Marx, banished first from Germany and then from Paris, fled that country with Engels, his lifelong friend, it was to Brussels that they came. Here they gathered round them other German fugitives and some Belgians, attracted partly by the brilliant philosophy of the young Hegelians, but even more by their revolutionary socialism, or communism, as it was then called. It was in Brussels that Marx and Engels wrote, at the request of a congress or conference between English and French working men, held in London in 1847, the famous manifesto, which was the first explicit utterance of modern revolutionary socialism. With a population denser than that of any other civilized country in the world, Belgium had long suffered more than most countries from the effects of capitalism. Mining is her chief productive industry, and in her mines men and women worked, side by side, sometimes almost naked, like animals rather than human beings, long hours—cases of their working 36 hours at a stretch are reported—for piteous wages, and like beasts of the earth.

Nevertheless, organization did not succeed until the time of the International. Says Professor de Laveleye:

"The International gained a footing in Belgium in 1865; but it was not until December, 1866, that the first section was constituted at Liege. We see in the report of the delegate, De Papepe, at the Congress of Lausanne, that a very active section had been founded at Brussels, and that the working men's societies of Ghent and Antwerp were connected with it. At the Congress

of Brussels, in 1868, the delegate Frère announced that several very large sections had been formed in the coal-basin of Charleroi, and that at Verviers the free laborers had joined and had even started a newspaper, the *Mirabeau*, which, strange to say, still exists. At Bruges a section was formed with a journal called the *Vooruit*, and soon afterward there appeared at Antwerp the *Werker*, which exercised a great influence over the working men in the Flemish towns. In December all the sections formed a federation. A general council of 16 members was chosen and a journal started, the *Internationale*. The sections were grouped according to the coal-basins, and were all to send delegates to the general congress held every year. It was almost a reproduction of the parent association. The strikes and conflicts which resulted therefrom, in the neighborhood of Charleroi and Seraing, attracted a great deal of attention to the International. The leaders, however, were unwilling to encourage strikes for fear they should fail. Thus, at the second National Congress of Antwerp, which sat from August 1-15, 1873, it was resolved that the federations should make every preparation for the universal strike, but that it was necessary to give up entirely partial strikes except 'in a case of legitimate defense.'

"At the time of its greatest diffusion the International counted eight federations; those, namely, of Brussels, Ghent, Antwerp, Liege, the Vesdre, the Borinage, the Centre, and Charleroi. As to the number of members, it has been variously estimated from 100,000 to 200,000. After the schism of The Hague between Marx and Bakounin, the Belgian Internationalists pronounced against the exclusion of Bakounin, without, however, adhering to his doctrines."

They, however, sent delegates to his so-called "Automnist" congresses of Geneva (1873), Brussels (1874), and Berne (1876). But when in 1877 a general congress was held at Ghent, De Paep declared for a Marxian policy, and the movement split. Henceforth the Socialists and "Automnists" went separate ways. In 1878 a German "Reading Club" was organized in Brussels, and a new agitation sprang up. Vollmar, a leading German socialist, made two tours of propaganda. A congress at Boom in 1878 declared for the Gotha program, a socialist labor party, and the journals *Le Voix de l'Ouvrier*, of Brussels, *de Werker*, of Antwerp, and *de Volkswil*, of Ghent. Controversy with the anarchists, however, prevented much progress, the anarchists having formed an active *union révolutionnaire*. A new and most important movement was now to spring up.

In the year 1879 a Ghent typewriter, an active socialist, Edward Anseele (*g.v.*), founded a cooperative bakery, and in connection with it a club, the *Vooruit*. Up to this time cooperation had not succeeded in Belgium, but this socialist cooperative movement succeeded and spread. A similar organization, called the *Maison du Peuple* (House of the People), was started by the Brussels socialists in 1882, and another at Verviers in 1884. In the next four years the movement spread through all the important Belgian cities and industrial centers. Soon the societies began selling other things than bread, till gradually the movement became one of vast size and importance. In 1893 the *Maison du Peuple* had 10,000 members, representing some 10,000 families, and manufactured 100,000 loaves of bread a week. It possesses a large club house, which is the center of socialist propaganda, a library, a tool store, and other property. It provides coal, groceries, meat, furniture, clothing, medical attendance, and insurance, all at cooperative prices. It maintains a monthly, a weekly, and a daily. Every one who belongs to it must adhere to the program of the (socialist) Labor Party (*Parti ouvrier*). Members

who for one month deal elsewhere than at the society's establishments may be expelled on a two-thirds vote. A similar work, though not on so large a scale, is carried on by the other socialist cooperative societies. The *Vooruit* at Ghent in 1893 had 5000 members; but the fact of importance is that these societies form a network over Belgium of socialist organizations, providing their members with all the necessities of life, and raising funds for active socialist propaganda. As a result, Belgian socialism has recently grown rapidly, and is perhaps better organized than the socialism of any other country. In 1885 a socialist working man's party was organized (*Parti ouvrier belge*), which is the political organization of Belgian socialism. Its power is seen in the fact that it was able in 1893 to effect in a few days a veritable revolution in the Belgian Constitution. Hitherto the Belgian socialist had been able to accomplish little politically, because of property limitations to the suffrage. There had been more or less of an agitation on the subject since 1882, but in 1893 the matter came to a head. A bill to introduce free suffrage was introduced into the Chamber and Senate and defeated. Immediately Labor Party, the Labor Party called a universal strike. According to M. Volders, 200,000 struck work upon that day alone. There was some resistance. M. Volders, the leader of the Labor Party, was arrested with two others. M. Buls, the Brussels burgomaster, ordered "The House of the People" closed, and prohibited meetings and processions. But this only added fuel to the flame. In spite of the leaders of the Labor Party, collisions with the police took place at Brussels, Antwerp, Mons, Quaregnon, and elsewhere. Numbers of men, women, and even children were shot down, and some mortally wounded. But the strike was won. On April 18, only eight days after its rejection of universal suffrage, the Constituante (the Assembly) met, and a hurried plan to revise the Constitution and grant a vastly enlarged suffrage was devised and carried, and the Labor Party declared the strike off.

The present program of the Belgian Labor Party (*Parti ouvrier belge*) is as follows:

PREAMBLE.

A party has been established among the Belgian labor associations, with the object of obtaining for workmen the political rights and material well-being of which they have hitherto been deprived.

Seeing that workmen only acquire these rights and this well-being through their own strength, the party will consist exclusively of labor associations;

Seeing that workmen have to contend against sickness and involuntary stoppage of work, and to secure their wages, the Labor Party will endeavor to obtain the greatest possible advantages for associations instituted with this aim, and to found similar associations in localities where they do not yet exist;

Seeing that workmen, like the rest of the world, have a right to the greatest possible liberty, the widest instruction, a good education, and all the enjoyments of an advanced civilization, the party will work zealously to attain this end;

Seeing that workmen, in spite of all sacrifices, cannot succeed in instituting pension funds, disablement funds, or funds for assistance in case of sickness, rich enough to pension an old workman, and effectually to support those who are sick or in distress;

Seeing that the majority of workmen possess neither the material nor the tools for agriculture or industry;

Finally, seeing that they have absolutely no part in the management of factories, mines or workshops, and are consequently powerless and helpless against industrial and commercial crises, which affect them so terribly;

The Labor Party is of opinion that the State should intervene to assure the fate of the workman during the period of work, sickness, and old age.

To this end, the Labor Party will not be satisfied with founding funds for assistance in case of sickness, co-operative societies, and protective societies, but it will also take the character of a political party, in order to obtain from the State the support necessary for the perfect well-being of the working classes.

Seeing that governments conclude international, commercial, postal, and maritime conventions;

Seeing that the interests of workmen are everywhere identical, and in order to prevent strikers from being supplanted by other workmen in times of difficulty, the Labor Party declares that it wishes to place itself in sympathetic relations with the associated workmen in every country who share its views;

Seeing that the cause of the misery and dependence of the masses is due to the method of working, since the greater part of the workmen do not possess the tools necessary for their work, the Labor Party will endeavor to replace this system of capitalistic production by a mode of working which has for its foundation the common possession of the soil, the sub-soil, and the necessary tools.

In addition to these general objects, and in order to attain its final aim, the Labor Party demands the reforms set forth in the following program:

1. Universal suffrage; direct legislation by the people, that is to say, popular sanction and initiative in legislative matters, secret and compulsory voting; elections held on Sunday.

2. Secular, compulsory and complete education for all children, to be conducted at the cost of the community, represented by the State or the communes. Higher instruction by means of classes for adults.

3. The separation of Church and State, religion being considered as a private matter, the suppression of religious expenses, and the return to the nation of property "in mortmain," both personal and real, pertaining to religious corporations, as well as all the industrial and commercial property of these corporations.

Political Program.

4. The application, to all cases, of the system of trial by jury, and of settlement by councils of arbitration elected by universal suffrage. Free administration of justice, and the revision, in an equitable sense, of the articles of the code which establish the political or civil inferiority of workmen, women, and natural children.

5. The abolition of conscription, and of the system of substitutes. The equality of military commissions, and the reduction of war expenses. The abolition of standing armies, and the decision of peace and war by the people.

6. The investment of the communes with the control of their own administration, their budget, police, and all their public officers. The nomination by the electors of the burgomaster and sheriffs.

7. A law according State recognition to workmen's syndicates (including among other privileges the right to hold property and plead in court).

8. A rest of one day in each week; employers to be forbidden to cause work to be done on more than six days out of seven.

9. A law limiting the age at which any person may work, and the duration of such work, in the following manner: (a) The abolition of work for children below 12 years of age; (b) a combination of work and instruction, and the abolition of all night work for young persons from 12 to 16 years of age; (c) the abolition of the employment of women in all industries in which their employment would be incompatible with morality and health; (d) the establishment by law of a normal working day for adults of both sexes.

10. A commission elected by workmen, and paid by the State, to introduce healthy and safe conditions into workshops. The sanitary supervision of dwellings.

Economic Program.

11. The real responsibility of employers in cases of accidents in connection with work, by a law stipulating that it devolves upon the employer to prove, if necessary, that an accident was due to malice on the part of the workman.

12. The regulation of convict labor, so as to put an end to the competition now made with free labor, and

to allow prisoners, at the time of their release, means of finding employment, to avoid falling back into crime.

13. Workmen, and, by preference, labor associations, to have a share in the government of workshops. The suppression of fines and deductions from wages. The suppression of benefit funds regulated by employers. The reversal of the management of these funds to the workmen themselves.

14. The reorganization of councils of *prud'hommes* on a basis of equality. Employers to be forbidden to require testimonials and certificates.

15. The gradual transformation of public charity into one vast system of insurance by the State, the provinces, and the communes.

16. The abolition of all taxes on articles of consumption. The abolition of customs, and a progressive tax on net income.

17. The abolition of all contracts and laws alienating public property (such as the national bank, railways, mines, communal property), and the return of this property to the community, represented, according to the case, by the State or the commune.

18. The abolition of all laws made in favor of employers at the expense of workmen.

The Belgian Labor Party is a very compact and well-organized body. It has a strike fund to which all its cooperative societies contribute. It has many papers—*Le Peuple*, *Vooruit*, *De Toekomst*, *De Werker*, *L'Avenir*, and *L'Emancipation*.

The Belgian socialists are carrying on an especial agitation against standing armies. The spreading of this idea in the army itself they have entrusted to an organization of young socialists, the *Jeune Garde Socialiste*, who publish an organ of their own. There is also considerable activity among the women, and a paper in their interests.

The temper of the Belgian party is extremely radical. Upon the walls of "The House of the People" at Brussels are the mottoes: "What is the worker? Nothing. What shall the worker be? All." "You cannot stop the murmuring of the people when they cry, 'We are hungry,' for it is the cry of nature, and shall be heard." "The working people are the rock upon which the church of the future shall be built."

Although this movement of the Labor Party is the dominant industrial reform movement today in Belgium, it is not the only one. Cooperation and profit sharing have some hold in Belgium apart from the labor movement, but will be considered under article COOPERATION. Labor exchanges have been established by many municipalities. In February, 1892, a Federation of Labor exchanges throughout the country was formed to facilitate means of finding work for the unemployed in any part of Belgium, to study questions relating to the organization of labor exchanges or markets, and to establish new exchanges. Arbitration and conciliation have received considerable attention. (See ARBITRATION.) Belgium has also taken some steps toward the employment of the unemployed (see UNEMPLOYMENT), and has developed some industrial legislation as to Employers' Liability Laws, etc. Working men's dwellings have been much discussed.

In 1869 a commission was appointed to investigate the general condition of miners and metal workers, including their dwellings. It was then stated that many coal companies had built houses which were let to married workmen. Single men generally lived in lodgings, which, in most cases, were in a miserable state. The inquiry of 1869 was not followed by any practical result.

and the terrible revelations made to the Labor Commission in 1886 showed that little or no improvement had been made since the publication of the report of 1846. In March, 1888, the Government introduced a bill which became law on August 9, 1889. This law provides for the institution of committees of inspection (*comités de patronage*), which can empower the savings bank to lend part of its funds for the building or purchase of workmen's houses, and regulate the conditions under which expropriation by zones should be carried out. In Ghent, where the number of persons in each house is lower than in any other town in Belgium, the society *Eigen Heerd is goud weerd* makes similar loans. The 1890 report of the Brussels committee, established by virtue of the law of 1889, shows that 491 families occupied separate houses, 1371 three or more rooms, 8058 two rooms, 6978 one room, 2186 a garret, and 200 a cellar. Of the families living in one room, 1511 consisted of more than five persons. The first cooperative building society was established at Brussels in 1890. In 1891 a decision of the general council of the savings bank, approved by a royal decree, provided that the loans for building should not be made to the workmen directly, but through the medium of a society. On November 25, 1892, advances had been made from the general savings bank and pension fund to 23 joint-stock and 4 cooperative societies at the rate of interest of 2½ per cent., and at 3 per cent. to 10 joint-stock and 2 cooperative societies. The capital of the joint-stock societies amounted to 3,265,000 frs.

The Roman Catholic Church has been especially active in social reform in Belgium. It has made Louvain a center for Roman Catholic Christian Socialism. (See CHRISTIAN SOCIALISM.) The movement is, however, divided into the two policies of uniting with the Social Democrats, to win them for the Church, or of opposing Social Democracy with the program of social reform under the patronage of the Church. Considerable State socialism also exists in Belgium.

The Belgian monarchy has been in many ways the most advanced and liberal monarchy in Europe. Formed only in 1830, it has had less to unlearn than most monarchies. When King Leopold, long resident in England, and familiar with English business, ascended the throne in 1831, he set himself to develop the industrial interests of his kingdom. As early as 1833 Belgium began a system of State railways, and under the intelligent patronage of the king competed successfully for the through freight from Germany to England. To-day the State operates 3241 kilometers out of the 4517 kilometers of railroad in the country, the private roads, too, being mainly unimportant lines. Railroad rates are lower than anywhere in the world except on a few lines in East India. The receipts in 1891 were 142,736,211 frs., and the expenses 84,464,020 frs., leaving a large revenue for the Government. From 1835-91 only 93 persons, including passengers and employees, have been killed by collisions or derailments; 2948 on railroad crossings and in all ways, including suicides, on the road. In the United States the Interstate Commerce Commission reported in 1891, 2953 killed in this country on the rail-

roads; in one year alone nearly as many as in Belgium in 56 years, with a population one eleventh of the population of the United States.

The employees on Belgian roads work, too, less hours and at better wages than most workmen in Belgium. Nevertheless, this is saying little. Belgium, with her dense population (the densest in the world) and resultant competition, has developed deplorable industrial conditions, though of recent years there has been considerable improvement in many respects.

This is shown by a comparison established by the Minister of Agriculture, Industry, and Public Works, between the average rate of wages in 1846 and 1891 in 24 industries at Brussels:

TABLE SHOWING AVERAGE DAILY WAGE IN BRUSSELS IN 1846 AND 1891:

INDUSTRY.	Average Daily Wage.	
	1846.	1891.
Masons.....	Frs. 1.70	Frs. 3.75
Stonecutters.....	1.79	4
Carpenters.....	1.95	3.80
Plasterers.....	1.88	3.50
Molders in plaster.....	2.25	4
House-painters.....	1.70	3.75
Cabinet-makers and carvers..	1.08	5
Blacksmiths.....	1.75	4.50
Printers.....	2.50	5.50
Bookbinders.....	2	5.50
Goldsmiths.....	2.55	4.50

It must be remembered, however, that this is only for Brussels. For the mines the Report on Belgium of the (English) Royal Commission on Labor (1893) says:

"In 1891 the average annual wage of workers in and about mines was 774 frs. (\$150), whereas in 1890 and 1889 it was 807 frs. and 743 frs. respectively."

If this be the average annual wage, it can be imagined what must be the condition of some of the employees. According to the Belgian *Annuaire Statistique* for 1892, p. 247, the condition of the agricultural laborers is worse still. It gives a table for 1880, and indicates that there has been little if any improvement.

TABLE SHOWING AVERAGE DAILY WAGE OF AGRICULTURAL LABORERS IN 1880.

References: The best authorities on Belgium and social reform are the *Report on Belgium of the (English) Royal Commission on Labor* (1893), the Belgian *Annuaire Statistique*, and other official publications.

BELLAMY, EDWARD, born 1850 in Chicopee Falls, Mass., is the son of Rev. R. K. Bellamy. Altho he has traveled extensively, he still lives in the house of his birth, where his father lived 35 years. He graduated at Union College and studied law, but soon entered journalism, writing for many papers, principally the *Springfield Union*. His first novel was *A Nantucket Idyl*, a short summer romance. *Dr. Heidenhoff's Process*, *The Blind Man's World*, and *Miss Ludington's Sister* followed. All are dreamy, fantastic novels, but with such power that Mr. Howells declared that "the mantle of Hawthorne has fallen upon Mr. Bellamy." He then wrote *Looking Backward*, upon which his great fame depends. (See NATIONALISM.)

In the *Nationalist* magazine he has related how he came to write that book; how it took shape from an original plan to write a sort of fairy tale of social felicity—"a cloud palace for an ideal humanity"—in the shape of a great world-nation. At that time he had no particular sympathy with any projects for social or industrial reform; not, however, through any "indifference to the miserable condition of the mass of humanity; seeing that it resulted rather from a perception all too clear of the depth and breadth of the social problem and a consequent skepticism as to the effectiveness of the proposed solution." The idea of an industrial army for maintaining the community, precisely as the duty of protecting it is entrusted to a military army, was directly suggested "by the grand object lesson of the organization of an entire people for national purposes presented by the military system of universal service for fixed and equal terms, which has been practically adopted by the nations of Europe, and theoretically adopted everywhere else as the only just and only effectual plan of public defense on a great scale. What inference could possibly be more obvious and more unquestioned than the advisability of trying to see if a plan which was found to work so well for purposes of destruction might not be profitably applied to the business of production, now in such shocking confusion?" This idea had been vaguely floating in his mind for a year or two, but it was not until he began to work out the details of his romance of the thirtieth century that he perceived the full potency of the instrument he was using, and "recognized in the modern military system not merely a rhetorical analogy for a national industrial service, but its prototype, furnishing at once a complete working model for its organization, an arsenal of patriotic and national motives and arguments for its animation, and the unanswerable demonstration of its feasibility drawn from the actual experience of whole nations organized and maneuvered as armies."

This idea led to a complete recasting of the book, both in form and purpose, and the author was filled with the fervent desire to acquaint the people of his country with its beneficent possibilities—a desire which the popularity of *Looking Backward* has abundantly realized. The form of a romance was reluctantly retained, only with a view to obtain a reading for the book.

The year 2000 instead of 3000 was fixed upon

as the date of the story, for with his new belief as to the part which the nationalization of industry is to play in bringing in the good time coming, it appeared reasonable to suppose that by the year 2000 the order of things to which we look forward will already have become an exceedingly old story.

The book soon after its appearance made a sensation; a Bellamy Club was started in Boston, and from that grew the Nationalist Club, and then the Nationalist movement (*q.v.*). The book has reached a sale of over 500,000 copies in this country, and has been translated into most of the languages of Europe. In the beginning of 1891 Mr. Bellamy commenced the publication of a weekly, *The New Nation*, as an organ of nationalism. It was suspended, however, at the close of 1893. Mr. Bellamy still resides in Chicopee Falls, writing magazine articles and new books in advocacy of nationalism.

BELLERS, JOHN, born about 1654; died 1725. He was a member of the Society of Friends, joint lord of the manor of Coln St. Aldwyn's, and devoted to philanthropic projects. He wrote numerous pamphlets, the best known of which is *Proposals for Raising a College of Industry* (1695-6), in which he proposed that the rich should provide capital and receive profit by building a college in which destitute men and women could find work.

BEMIS, EDWARD W., was born at Springfield, Mass., in 1860. He was graduated from Amherst in 1880, receiving the class honors in history and political economy. In 1885 he took the degree of Doctor of Philosophy at Johns Hopkins University, having meanwhile spent two years in the West, part of the time as an editorial writer on the *St. Paul Pioneer Press*, later as principal of one of the Minneapolis schools.

During the winters of 1887-88 and 1888-89 he conducted University Extension courses on Political Economy in Buffalo, St. Louis, and other cities. In 1889 Dr. Bemis took charge of the Department of History and Economics at Vanderbilt University, resigning in 1892 to accept the position of Associate Professor of Political Economy in the University Extension Department at the University of Chicago. This engagement, however, was terminated September, 1895. In 1886, at Springfield, Mass., and in 1887, at Buffalo, N. Y., he organized the first two branches of the American Economic Association.

Among his writings we mention *Municipal Ownership of Gas in the United States* (American Economic Association, vol. vi., Nos. 4 and 5); *Cooperation in New England and the Middle States* (parts i., ii., and iii. of *History of Cooperation in the United States*, Johns Hopkins University Press); *Local Government in Michigan and the Northwest* (vol. i., No. 5 Johns Hopkins University studies); *Mine Labor in the Hocking Valley* (vol. iii., No. 3 American Economic Association); *The Relation of Trade-Unions to Apprentices* (*Quarterly Journal of Economics*, October, 1891); *Benefit Features of American Trade-Unions* (*Political*

Science Quarterly, June, 1887); *The Labor Organizations of America* (in press, in *Dictionary of Political Economy*); *Cooperative Life Insurance* (in new edition of Johnson's *Encyclopedia*); *Local Government in the South and Southwest* (Johns Hopkins University Historical Studies, vol. xi., Nos. 11, 12); *Recent Results of Municipal Gas Making* (Review of *Reviews*, February, 1893); *Insurance of American Working Men* (*Handwörterbuch der Staatswissenschaften*, Germany); *Cooperation* (*American Annual Encyclopedia* for 1888); *Relation of Labor Organizations to the American Boy and to Trade Instruction* (in *Annals of the American Academy of Political and Social Science*, September, 1894).

He classes himself with the historical school, yet not in a way to deny the great benefits of the so-called Manchester school or to forsake their many wise methods of investigation. As to the tariff, he believes in gradual reduction in tariffs upon extractive industries, and later upon others, but endorses the scientific possibility of wise protection at some times and places. He believes in the municipalization of gas, electric light, telephones, and street-car lines; the nationalization of the telegraph, and in a less decided way thinks that ultimately we may find it wise to have national ownership of railroads. On the currency, he is an international bimetalist.

BENTHAM, JEREMY (1748-1832), son of a wealthy solicitor in London, graduated at Queen's College, Oxford, in 1766, at the age of 18. He was called to the bar in 1772, but never practised his profession. He became, rather, the greatest critic of government and legislation in his day. His first publication was *A Fragment on Government* (1776). His first important economic treatise was *A Defense of Usury*, in which he tries to prove by close reasoning that when the Legislature fixes a maximum rate of interest it does not benefit the right persons, and encourages deceit and raises the rate of secret interest by adding the danger of discovery. He proceeds to urge that every man is the best judge of his own welfare, and that it is for the public good to leave him free to seek it. Bentham published *A Manual of Political Economy*, but he influenced economic thought even more by his philosophic writings. Through James Mill and Ricardo, not only did utilitarianism, but Bentham's peculiar form of utilitarianism, became prominent. Beccaria in 1764 had coined a convenient phrase, "The greatest happiness of the greatest number," and Bentham took this up and made it the ruling principle and chief end of legislation. This, too, he taught to be identical with the extreme *laissez-faire*. Whatever distress, he held, this might bring upon the individual, it was for the greatest good of the greatest number. Through the *Westminster Review* he and his followers made this thought very influential upon the men of his day. Bentham was also a great believer in education, especially of the working classes, whom he considered the most important part of the community. He aided Robert Owen by taking shares in his factory at New Lanark.

His works and life, edited by Bowring, fill

11 volumes, of which the tenth and eleventh contain the life. His chief economical works are: *Protest against Law Taxes*; *Supply without Burden*; *Tax with Monopoly* (i.e., a tax on bankers and stock-brokers); *Defense of Usury and of Projects in Arts*; *Manual of Political Economy*; *Conversion of Stock into Note Annuities*; *Invention and Discovery*; *Hard Labor Bill*; *Tracts on Poor Laws and Pauper Management*.

BEQUEST, POWER OF.—This is an inheritance of modern nations from the Roman law, which allowed three fourths of the inheritance to be willed away from the next of kin. The Koran allows two thirds, and the Mishna recognizes gifts of property to take effect on death. (See INHERITANCE.)

BERLIN.—With a population, in 1890, of 1,579,244, Berlin is one of the most rapidly growing and progressive cities of the world. In 1870 it had only 800,000 inhabitants, and in 1840 only 331,894. This growth only brings into greater prominence the high grade of its municipal life. Professor R. T. Ely calls it one of the best-governed cities in the world. In cleanliness and in the attractiveness of its parks, streets, and public buildings it is scarcely surpassed by Paris. The following account is abridged from Mr. Sylvester Baxter's *Berlin: A Study of Municipal Government in Germany*:

"The principal streets are paved with asphalt, and the most frequented are literally washed and scrubbed every night. The consequent freedom of the city from dust is very marked. The smoothness of the pavement affords immense relief in diminishing the noise and jar of the streets. The broad sidewalks are laid with flagging in the center, and between that and the curbstone are paved with small, mosaic-like stones that form a smooth surface, and are easily removed and replaced. Beneath this space are laid the gas-pipes, telegraph and electric-light wires, pneumatic tubes, etc., so that in laying or repairing these the street pavement is not disturbed.

"Instead of adding ugliness to the streets, the arc-lights of Berlin are things of beauty, an artistic embellishment to the city. Unter den Linden is probably the most brilliantly and beautifully illuminated street in the world.

"The incandescent light is very extensively used. "The telephone service is admirable, as is testified by the public appreciation, there being over 10,000 instruments in use in Berlin. There are no private telephone companies in Germany, the telephone, like the telegraph, being a branch of the postal service. The price for telephone service is low, the annual charge for an instrument being 120 marks a year, or something less than \$30. The long-distance service between the principal cities of the empire is being rapidly introduced.

"Postal administration is regarded in Germany as a practical science in itself, and no means is neglected to promote the interest of members of the service in its study. Pneumatic tubes radiate out over the city from the central post-office, connecting various local stations at frequent intervals, so that a message is delivered in almost any part of the great city within half an hour. The postage for the pneumatic service is 2½ pfennige, or 6¼ cents. Telegrams are very extensively sent and delivered by means of the pneumatic service.

"The *Stadtbahn*, or city railway, in Berlin is a great convenience. It is an elevated railway traversing the city from east to west, and connecting with the Ringbahn, or belt railway, that surrounds the city. Both belong to the Prussian Government, and are of great military value, enabling the saving of two or three days in the mobilization of troops and their rapid transportation through the city in case of need. The stations are elaborate and handsome affairs, with arching roofs. There are four tracks, two for local and two for through traffic, and all express trains from distant

Local
Transit.

cities are brought into one grand central station at the Friedrichstrasse, in the heart of the city.

"The street railway system of Berlin is excellent. It is all in the hands of one great company; but Berlin obtains in return for the street railway franchise: (1) the paving of the streets on which the cars run, from curb to curb, with the best of material; (2) the keeping of these streets in repair by the street railway company; (3) a percentage of the gross receipts of the company, and (4) the entire plant of the company on the expiration of its franchise in 1911. Altho subjected to municipal regulations that require an equipment of the highest standard, low rates of fare, and strictly limit the number of persons that a car may carry, so that overcrowding is not permitted, the company not only easily meets all these obligations, but pays handsome dividends and accumulates a sinking fund that will equal the capital invested by the time the franchise expires and the plant becomes the property of the city. This source of revenue for the municipality amounts to something like \$250,000 a year.

"Berlin has an admirable park system. There are five great parks around Berlin. The Thiergarten, composed principally of a noble old forest, has been greatly improved within the past few years, and is now one of the finest parks of Europe.

"Throughout the city nearly all the open places are occupied by beautiful gardens. These urban gardens are extensively used for children's playgrounds, and here and there are placed heaps of sand for the smaller ones.

"The form of the municipal government of Berlin is, in general, that prevailing throughout Prussia as determined by the municipal reform laws created by the great statesmen, Stein and Hardenberg, in 1808; the laws which have given a general model for the forms of municipal government now prevailing throughout the German Empire.

Municipal Government.

"While throughout the empire universal manhood suffrage prevails, in the city governments the suffrage is slightly restricted. Every honest inhabitant obtains the electoral franchise after a year's residence and at the age of 24, if he pays what is called a class tax on an income of about \$150. These restrictions make the qualified voters in Berlin about 13 per cent. less in number at municipal elections than in the national elections.

"Over 10,000 citizens take part in the administration of affairs, and in the city government are the best and most prominent citizens. There are men like Professor Virchow, Professor Gneist, and others from the University, natural leaders in public life; men of worldwide reputation and ranking as statesmen, taking their regular part in the routine of city affairs. Professor Gneist has been a member of the city government since 1848. To skirk these responsibilities is hardly possible for any man, even if it were desired by him, for every citizen is obliged, under penalty of a fine and a heavy increase of taxation, to accept any position to which he may be elected.

"The Berlin system aims at the greatest efficiency and economy attainable under a fundamentally popular representative form. The broad basis of the government is to be found in the Municipal Assembly, a body composed of 126 members, representing the 326 wards of the city. One half at least must be house-owners; and two brothers, or father and son, are not allowed to be members at the same time. The members of this body are chosen for six years, one third retiring every two years, so that there is a municipal election once in two years. The long terms of members give them experience, and the remaining in office of a large majority of old members assures the management of affairs by persons thoroughly conversant with municipal business. This assembly directly represents the people, and out of it proceed all the other features of the municipal government. It has the entire financial control of affairs, being supreme in drawing up the budget for the year, and in authorizing extraordinary expenditures. It has no executive functions as a body, but its members exercise them individually in association with other branches of the government.

"This assembly chooses the upper branch of the city government, known as the Magistracy, and composed of the board of mayor and aldermen, the latter 32 in number, 15 of whom are salaried, while 17 are honorary members with no salaries whatever. The mayor is chosen for a period of 12 years, nominally subject to the approval of the king. His salary is 30,000 marks, equal to about \$7500, which, in its purchasing value in Germany, would probably be substantially the same as the \$10,000 paid in Boston. It is a post of the highest

honor, and may be considered equivalent to a life position, for when there is a vacancy in this office in a large German city it is customary for the authorities to survey the field throughout the country, and select from the mayors of other cities some man of the highest qualifications for executive and general business efficiency; and the person thus agreed upon can usually make his own conditions and be sure of reelection when his term expires, if he does not choose to retire upon a liberal pension.

"The 15 salaried aldermen are elected for 12 years by the municipal council, with especial regard to the qualifications for administering the departments over which they are to rule. Their salaries being higher than those of the local judges and the higher members of the civil service, the offices are made attractive to the best class of men, who must have received a thorough training in the splendid civil service of Prussia from which they were chosen. It is also the custom to reelect these men on the expiration of their terms, if they do not choose to retire on their pensions. These paid aldermen consist of the deputy mayor, two legal advisers, the city treasurer, two school councilors, two architects, and seven aldermen without special title who may be assigned to any positions they are deemed most fit to occupy. These men correspond to the heads of our various department commissions, but it is a great advantage to have them regular members of the board of aldermen, where they may take part in the deliberations.

"The 17 unpaid aldermen are chosen by the assembly for terms of six years, are usually taken from the higher class of citizens and, indeed, from those members of the assembly itself who have distinguished themselves by years of efficient service in various departments. Their positions are esteemed of great honor, and the incumbents assume the same duties as those of the paid aldermen. They are also usually reelected at the end of their term, so that any competent man may be a member of the city government for life, if he chooses; and under this system it would be difficult for an incompetent member to be elected. Professor Gneist, in his admirable paper contributed to the *Contemporary Review*, calls this board of aldermen 'the soul of the government of the city,' and points out that its ability to control the wide range of important interests of so large a community is due to the excellent division of labor which has gradually developed itself in the management of the business.

"The voters of the city are divided into three classes, a system which prevails throughout Prussia. These classes are divided according to the rate of taxes they pay. In the first class come those heaviest tax-payers who pay one third of the entire levy. In the second class come those who pay the next third, while the third class comprises all the rest of the tax-payers. Each of these classes chooses one third of the assemblymen who are to be voted for at an election. In consequence a majority of the assembly is chosen by a minority of the voters, the principle prevailing in municipal suffrage in Germany being similar to that in a financial corporation, where voters exercise a power corresponding to that of the number of shares they hold.

"The two chambers are supplemented by a body of 70 'citizen deputies,' as they are called, selected by the assembly from distinguished citizens to serve on general committees for the administration of special affairs, such as the relief of the poor, the conduct of the schools, etc.

"In Berlin the police is administered by the State instead of the city. The force consists of something like 3000 men, besides their officers; and the expense, amounting to nearly \$400,000 annually, is borne by the city.

Police.

"The system of taxation comprises an income tax of 3 per cent. on all incomes above a certain amount; a house and rent tax, apportioned between the landlord and the tenant; and various minor special taxes.

"The relief of the poor is performed by 223 local commissions, each composed of between 4 and 12 citizens, or honorary members, with the assemblyman of the district as member *ex officio*. One feature is the assignment of certain city lands to the poor, for planting with potatoes. Only vagabonds and altogether unworthy persons are sent to the workhouse. The charitable institutions of the city are numerous and well conducted. The relief of the poor in 1881-82 cost over \$1,100,000. This system probably accounts for the marked absence of evidences of distressing poverty. The fire brigade of Berlin is a military organization with 750 men, besides officers, and was maintained in

1882 at a cost of about \$370,000. The cleaning of the streets is admirably done. It always takes place between midnight and eight o'clock in the morning.

"The municipal gas-works yielded, at last accounts, something like 18 per cent. of the entire annual expenditure of the city as profit.

"The water-works also yield an annual profit of considerably over \$250,000; and even the great sewerage system has produced a net revenue of something like the same figure, through the annual rate imposed upon house-owners for the use of sewers.

"The school system of Berlin is one of the prides of the city. It is controlled by a school board composed of members of the city government, superintendents of the church dioceses, together with the dean of the Catholic churches, and 87 local committees, upon which something like 1300 citizens serve.

School System.

There were in 1881, 118 large common schools, attended by rich and poor alike. There are, besides, 10 gymnasiums, corresponding to our Latin schools; 7 real schools, corresponding to our English high schools; 2 industrial schools, and 4 high schools for girls, all very largely attended, besides 6 State schools, comprising 4 gymnasiums, 1 real school, and 1 high school for girls. Another important class of schools, *die Fortbildungsschulen*, or supplementary schools, was founded by the city to enable apprentices and clerks to continue their studies. There are 12 schools of this kind. There are also Sunday classes for young people of both sexes, maintained chiefly by private subscription. Every school building has a gymnasium, large and well equipped, for athletic instruction; and besides, there is a Turn Halle, a great and model institution for athletic training; also something like 90 private schools, that find it more and more difficult to compete with the public schools, so excellent are the latter. These private schools are also under the supervision of the public school authorities, and must conform to public standards; there are also 22 public libraries, mostly in the charge of the head masters, for sending out instructive books free of charge.

"Owing to the excellent condition of the finances, Berlin has founded a number of institutions of credit on the security of the wealth of the city. One is a municipal savings bank, with deposits now amounting to something between \$12,000,000 and \$13,000,000, with 39 offices for receiving deposits in various parts of the town. It pays an interest of 3½ per cent. There is also a municipal fire insurance office, in which all the house-owners are obliged to insure. In 1882 the value of buildings insured was over \$500,000,000, and since that time has enormously increased. Owing to the substantial construction of the city and the excellent fire department, the annual premium is only 5 or 6 cents on \$100. Another city institution is a mortgage bank, established in the interest of the credit of real estate, issuing on varying terms mortgages at 4, 4½, and 5 per cent."

Thus far Mr. Baxter. A few statistics may be added. Berlin spends 17 per cent. of expenditure on education, compared with New York's 9 per cent., Chicago's 14 per cent., Paris' 16 per cent., and surpassed only by Boston's 18 per cent.

Professor Commons states that Berlin profits \$1,000,000 yearly on her municipal gas-works. According to Dr. Albert Shaw, Berlin has acquired 30 square miles for the purpose of disposing of the sewage of a city which only covers 25 square miles within the municipal limits. Berlin spent £1,500,000 sterling in buying and laying out its sewage farm. The system is an unqualified success from the sanitary point of view, and after a sufficient period has elapsed it is expected that the sewage farm will earn sufficient profit to pay back all that has been invested in it, and contribute materially to lessen the load of municipal taxation.

The famous Stadtbahn of Berlin, built by the Imperial Government at a cost of \$16,270,000, traverses the city, and with a north and south ring furnishes an elevated railroad which the report of the Rapid Transit Commission of

Massachusetts in 1892 calls "unsurpassed." According to this report (pp. 194, 195), the fares on the road, third class, are 2½ cents for five miles or less, with season tickets allowing one to ride as many times a day as he will for \$4.50 a year. If a person is absent over 14 days, he can have his ticket extended for the time he is to be absent. The construction and conveniences of the road are unsurpassed.

Concerning Berlin's finances, Mr. L. S. Rowe states in the addresses of the National Conference for Good City Government at Philadelphia (pp. 118-120), that of the \$19,000,000, which was the revenue of Berlin in 1892, scarcely 50 per cent. came from direct taxation, this being about equally divided between a highly developed income tax and a tax on rent and houses; \$4,500,000, he says, came from the profits on municipal enterprises—gas-works, water-works, markets, slaughter-houses, sewage; \$500,000 came from the city's interests on the street railways; only \$1,500,000 came from a loan. Of Berlin's debt of \$60,000,000, about 80 per cent., he says, is due to large municipal enterprises that are paying for themselves. Berlin is still a crowded city; but these improvements, according to A. R. Conkling (*City Government in the United States*), have reduced the death-rate from about 30 per 1000, in 1873, to 20 per 1000 at present.

References: *Berlin: A Study in Municipal Government*, by J. Pollard (London, 1893); *Berlin: A Study of Municipal Government in Germany*, by Sylvester Baxter (originally given as a lecture, Boston, 1891, and since published as a tract); *United States Consular Reports* (May and June, 1891).

BESANT, ANNIE (née WOOD), was born in London in 1847. Her father dying while she was yet young, she was brought up by her mother under straitened circumstances, mainly at Harrow. She married the Rev. Frank Besant in 1867. Two children were born to them, and during a sickness of the younger Mrs. Besant fell into great doubts as to the goodness and then as to the being of God. Finally, after most distressing experiences, from which she strove to find comfort from High Church fathers and Broad Church thought (consulting, among others, both Dr. Pusey and Dean Stanley), she failed to find relief, and became an avowed atheist. Her husband felt that he must leave her and take her children, even by force of law, from what he considered her pernicious teachings. This not unnaturally embittered her against Christianity and the Church, and she devoted all her energies to writing and lecturing for Free Thought. Becoming acquainted with Mr. Bradlaugh, she spent many years working with him, lecturing through all England, and editing the *National Reformer*. She was opposed, and in some places even stoned, but still kept steadfastly to her work. She became convinced of and advocated the necessity of neo-Malthusianism—in limiting the number of children, especially among the poor. Gradually she came to work more among and for the poor, and at last became an avowed socialist, the most famous and active woman worker for socialism in England. She was especially active in work for women, organizing them into unions, and in particular successfully conducted the

great strike of the match-girls in East London. She still wrote continually, becoming a member of the Fabian Society (*q.v.*) and the author of one of the best in their collection of essays. Her socialism finally took her away from Mr. Bradlaugh, and more recently her religious nature has made her embrace theosophy, becoming at first the friend and confidant of Madame Blavatsky, and now practically her successor. At present it is to theosophy that she devotes her main time and thought. Her writings are very numerous, but are mainly brief essays or tracts on free thought, Malthusianism, socialism, and theosophy. In 1885 she wrote an interesting book of *Autobiographical Sketches*.

BESANT, WALTER, was born in 1838 at Portsmouth, and was educated at King's College, London, and Christ's College, Cambridge. After graduating, he accepted the appointment of senior professor in the Royal College of Mauritius, but soon after resigned and returned to England. He produced his first work in 1868, entitled *Studies in Early French Poetry*, which was followed by the *French Humorists* in 1873. Mr. Besant is the author of *All Sorts and Conditions of Men*; *The Captain's Room*; *The Revolt of Man* (1882); *All in a Garden Fair* (1883); *Dorothy Forster* (1884); *Uncle Jack* (1885); *Children of Gibeon* (1886); *The World Went Very Well Then* (1887); *For Faith and Freedom* (1888); *The Bells of St. Paul's* (1889); *Armored of Lyonesse*, also two volumes of stories entitled *To Call Her Mine* and *The Holy Rose* (1890). It was due to an ideal pictured in *All Sorts and Conditions of Men* (1882) that the People's Palace in East London was built—a large club house for working men, where they can find art, amusement, education, bathing, gymnasium facilities, etc.

He entered into partnership with Mr. James Rice in 1871, and several novels have been published since then bearing their joint names. He also, with Mr. Rice, put on the stage two plays.

BETTERMENT is a term used in American law to denote an improvement of real property which adds to its value otherwise than by mere repairs. It is the custom in many American towns and cities, when the municipality introduces improvements, such as parks, drives, etc., that add immediate value to contiguous property, to assess a certain proportion of the cost upon the property thus immediately improved. In England a system prevails of allowing the municipal authorities to acquire land the value of which has been increased by betterments at compulsory sale, without reference to the increased value, and then of reselling at the enhanced price, and so recouping a proportion of the cost of the betterment. There is, however, in England considerable of an agitation for the American system. The defendants of the English system argue that the betterment assessment is difficult to justly assess, while the defendants of the American system assert that it is the fairest way to make those who receive the benefit pay the cost.

BIBLE AND SOCIAL REFORM, THE.—Charles Kingsley called the Bible "the reformer's guide," and declared its keynote to be "justice from God to those whom men oppress; glory from God to those whom men despise." Herr Todt, the German Christian Socialist, wrote: "Whoever would understand the social question and contribute to its solution must have on his right hand the works on political economy and on his left the literature of scientific socialism, and must keep the New Testament open before him."

(For the detailed social teachings of the Bible, see articles JUDAISM; MOSES; CHRIST; CHRISTIANITY.)

Those who hold that the Bible teaches definite principles as to the formation of human society upon earth, usually maintain that the Old Testament, through its history and in the Mosaic covenant, teaches the general principles of national righteousness, while the New Testament bids us fulfil this righteousness through the life in Christ in the heart. It is held by many Christian Socialists that the Old Testament covenant teaches what may be called the law for society. It founded a theocracy on earth. God was the Universal Father; every man of the theocracy a brother. Property in land was not absolute; the land was conceived as belonging to God. No individual could own it in fee simple. He could only use it. In its use he was inalienably protected. It came to him through the family as an inalienable inheritance. If, through poverty or misfortune, he temporarily parted with it, it returned to him in the year of jubilee. No landless, homeless class could, therefore, be permanently developed among the Hebrews.

The law went further. It cared especially for the poor, the oppressed, the children, the fatherless, the widow. Usury (or interest; all scholars agree that the two words originally meant the same thing) was positively forbidden between members of His kingdom. The law provided for every one's independence. It not only provided land for the worker, but defended him in the ownership of clothes, tools, etc. (capital), which could not permanently be taken from him. If taken as a pledge, they must be returned before night. No permanent mortgage indebtedness was, therefore, possible on either land or capital—that is, the law was truly socialistic in providing in the name of organized society for both land and capital for every family. And this was *not*, be it remembered, a law of mere individual righteousness. *In order to reap its benefits, the family had to belong to the theocracy.* The Jew could take interest from a foreigner; the foreigner could be enslaved, even killed. The law was essentially national and institutional.

Such, beyond all question, was the law of the Jewish kingdom. The Jews did not indeed observe it. They wandered far from it. But the law endured. The psalmists and the prophets are full of blessings on those who keep the law; are full of woes and condemnation upon the nation that wanders from it. The ceremonial was the precious shrine of a moral law still more precious. It is the moral law that is prominent. In the Psalms, Canon Fremantle has told us,

there is not one word about circumcision, not a word about the passover, not a word about Sabbaths, not a word about ceremonial uncleanness. Just relation between man and man; God in the natural, the national and social life—these are the constant themes. The same is true of the prophets. Isaiah says: "Bring no more vain oblations; incense is an abomination to me; the new moons and Sabbaths, the calling of assemblies, I cannot away with; it is iniquity, even the solemn meeting. Learn to do well; seek judgment (justice); relieve the oppressed; judge the fatherless; plead for the widow." . . . Micah says: "Will the Lord be pleased with thousands of rams or with ten thousands of rivers of oil? . . . What doth the Lord require of thee, but to do justly and love mercy and to walk humbly with thy God?" Such was the kingdom of heaven, of the law, and of the prophets. They thundered, not against the ritual law, but against those who robbed it of its meaning. They witnessed not against sacrifices, but against sacrifices of other people's property.

But the law failed. Law could not save, as law cannot save to-day. And yet it did not fail. It was *the schoolmaster to bring us to Christ*.

"What the law could not do in that it was weak through the flesh," that Jesus Christ came to fulfil. This is the *second* half of Bible sociology.

Christ's first preaching was of a kingdom. "From that time Jesus began to preach, and to say, 'Repent, for the kingdom of heaven is at hand.'" He sent out His disciples and the 70 to preach "the Gospel of the kingdom." Almost all His parables are about the kingdom. Of the kingdom are His main discourses. Just before His crucifixion He entered Jerusalem as a king. Before Pilate He declared that He was a king. On His cross was the inscription in three representative languages of the earth, declaring Him to be a king. After His resurrection He continued 40 days "speaking of the things pertaining to the kingdom of God." What did Jesus Christ mean by the kingdom of God? A kingdom implies four things. It implies a *king*, a ruler; it implies a *law*, the law of the king; it implies *subjects* who obey, or should obey, the king; it implies a *realm*, where the king rules. What king, law, subjects, and realm does Christ refer to? Where is the kingdom of heaven? It cannot be far away, because 18 centuries ago Christ declared that it was "at hand." It cannot be unknown, because Christ referred to it in His first utterances as something that His hearers perfectly well understood. It must by them have been understood of that kingdom of God which Moses tried to establish; of which David and the kings were faulty symbols; for which the prophets prayed and the poets sang; to which every Jew looked forward with a longing the more passionate the more it seemed deferred. Undoubtedly this was what the Jew understood by Christ's teaching. Yet it was not to be as they thought. It was to be spiritual, and for all nations. It was not to come by earthly might or by any law. It was to be chosen of men in freedom, not forced upon them; it was to come "without observation," and by the power of the Spirit. Such, in brief, is the social teaching of the Old and New Testaments. (See

articles JUDAISM; CHRISTIANITY; CHRISTIAN SOCIALISM.)

BIBLIOGRAPHY, a statement as to the very large and growing bibliography of social reform, with a list of the best bibliographies, will be found in Appendix I. to this work.

BILLINGS, Dr. JOHN SHAW, born in Switzerland County, Ind., in 1838; was graduated from the Miami University in 1857, and from the Ohio Medical College at Cincinnati in 1860. He became Medical Inspector for the Army of the Potomac, and later Librarian of the Surgeon-General's Office in Washington. In 1880 he was made President of the American Public Health Association. He is the author of many important official medical publications, and has written various articles bearing on the health of cities and municipal hygiene.

BILL OF EXCHANGE (from Lat. *bullā*), an order in writing addressed by one person to another to pay on demand, or at a fixed or determinable future time, a certain sum in money to a specified person or to his order. Bills, properly speaking, represent debts; they may be used, by negotiation, to transfer these debts from one person to another, and first-class bills form one of the best securities which a banker can hold. They sometimes, however, are drawn without being based on any genuine transactions; in this case their standing is more doubtful.

BILL OF RIGHTS.—An abstract of rights and privileges possessed by a people in relation to their government. In England it refers to an English statute of 1689 (I. William and Mary, Sess. 2, chap. ii.) declaring the rights and liberties of the subject, and settling the succession of the Crown in William of Orange and Mary, and to the rightful heirs of the latter, but excluding any Roman Catholic. It also provided that Protestants might have in their possession arms for their defense suitable to their condition. A similar declaration of personal rights is incorporated into the Amendments of the Constitution of the United States and in many State constitutions. Many labor reformers believe that those whom they consider the capitalistic classes have in many States quietly worked to drop the bill of rights and so abridge the rights of the people.

BILL OF SALE.—A formal instrument for the conveyance or transfer of personal chattels, as household furniture, stock in a shop, shares of a ship, or the like. It is often given to a creditor in security for money borrowed, or an obligation otherwise incurred. When it expressly empowers the receiver to sell the goods if the money is not repaid with interest, at the appointed time, or the obligation is not otherwise discharged, the contract is commonly called in the United States a chattel mortgage, not a bill of sale (*Century Dictionary*).

BIMETALLISM may be defined as the free coinage and use of gold and silver as money at

relative values set by legislative enactment, or as the union of these two metals in circulation as full money, at a fixed rate; and specifically as that system of coinage which recognizes both coins of silver and coins of gold as legal tender to any amount, or the free coinage and concurrent use of the two metals as a circulating medium at a fixed relative value.

The final report of the (English) Royal Commission on Gold and Silver, reporting in 1888, describes bimetallism as follows: "A bimetallic system of currency to be completely effective must, in the view of those who advocate it, include two essential features: (a) An open mint ready to coin any quantity of either gold or silver which may be brought to it. (b) The right on the part of a debtor to discharge his liabilities, at his option, in either of the two metals, at a ratio fixed by law." It is usually understood now to mean that the two metals are used thus at a fixed proportion to each other, as in the countries of the Latin Union (*q. v.*), in which the ratio of 1 gold to 15½ silver by weight formed the legal basis, or as in the United States, in which the ratio is 1 to 16.

Bimetallism as an economic question is of recent date, the word having been first used by M. Cernuschi in 1869, altho the concurrent use of gold and silver as money is old as civilization. (See MONEY.) The modern discussion of it, however, arose only shortly before the fall in the gold value of silver, which began about 1873.

We shall, in this article, give a general outline of the history of the bimetallic controversy, and the position to-day, with a notice of the main

arguments used for and against bimetallism. (For details of the history, see CURRENCY; SILVER; and for a full discussion of the theoretical monetary questions involved,

see CONTRACTION AND EXPANSION OF CURRENCY; MONEY.) Up to the year 1819 almost all nations issued coins of both gold and silver, as well as of other metals, and tried to regulate their relative values by royal or governmental proclamations. Altho supply and demand continually tended to change the relative value of the two metals, and altho from about 1760-1810 enormous quantities of silver poured into the world from mines in Mexico and elsewhere (so that in 1800 the world's annual silver product was nearly three times its product in 1700), the actual alteration in the relative values aforesaid was but slight. In 1803, therefore, France adopted her famous law, making 15½ parts of silver equal to one part of gold in all transactions, which had the effect, spite of still greater changes in relative production, of maintaining the relative values of the metals almost exactly steady at the figures named until the demonetization of silver by Germany in 1873. England, however, in 1816, under the second Lord Liverpool, took an opposite course, and demonetized silver as a standard, and ever since has used it only as a metal for subsidiary coinage. But now began a contraction of the currency of the world. The silver product of Mexico, owing mainly to revolutions in that country, fell off one half; the total gold product of the world for various reasons declined; paper currencies in France and England were retired;

the United States (see CURRENCY) went through marked depressions, with all forms of wild State banking. At the same time increasing discoveries and inventions cheapened production.

By 1849 prices had fallen some 65 per cent., and money (in England, gold) had become by so much the more valuable. England's capitalists, bankers, and princely money-lenders, who mainly shaped her financial policy, naturally enjoyed this. Contracting currency (see CONTRACTION) increased the value of their loans. But suddenly (1849) came the gold discoveries of California and Australia. In 1859, 30 times as much gold was produced in the world as in 1810. Money became cheap. Prices rose. Gold threatened to be so plenty that monometallists began to talk about demonetizing it. From 1862-65, moreover, the United States issued paper money (greenbacks, etc.) and liberated \$600,000,000 of gold, which went to Europe, and mainly to England. If the gold-holders and gold-lenders were to retain any advantage from their gold, it was necessary to take some steps. Consequently they sought (the extreme believers in silver say conspired) to get possession of as much gold as possible, and then to induce the various nations of the world to demonetize silver, to make gold the only legal tender. Soon the promise of unlimited outflow of gold from the mines began to fail, and thus to vastly increase the value of their gold.

Gradually the arguments of English economists in favor of the single gold standard began to make impression, and this was deepened by indications that an excessive supply of silver from the Bonanza mines of Nevada might be expected. In 1867, in connection with the Paris Exhibition of that year, an international monetary conference was held at Berlin, and since even delegates from the United States, among others, supported resolutions advocating the demonetization of silver, the idea of gold monometallism spread. The importance of the question to the United States was not generally felt at this time, though a few writers, considered radicals, pointed out the danger. Circumstances, however, either favored the gold monometallists, or they took shrewd advantage of circumstances to induce demonetization of silver.

The war of 1870-71, by securing to Germany a large sum of gold and merchantable paper equivalent to gold, in payment of the indemnity of \$1,000,000,000 exacted from France, put Germany into a position to establish the single gold standard for herself. As a very large amount of her international commerce is transacted with the United Kingdom, this proposal was welcomed by the business community as a convenience. The German Minister of Finance, Herr Delbrück, in this, as in other matters, was in sympathy with the English school of economists. The law of December 4, 1871, completed July 9, 1873, superseding the local coinage by an imperial coinage, demonetized silver by restricting its coinage to the amount regarded as necessary for change. Of the silver previously in circulation, about \$260,000,000 worth was called in by 1878, and only \$106,650,000 worth recoined by the imperial mint; while of gold, \$2,275,000 worth was called in, and \$409,500,000 was issued in the new coins. This left \$153,350,000 worth

of silver in the imperial treasury, to be disposed of in the silver market in such quantities as could be sold without loss. In the half decade 1866-70 the average price of silver had been 60 $\frac{1}{2}$ d. an ounce, being 1 oz. of gold to 15.55 oz. of silver, while the European standard of coinage valued 1 oz. of gold at 15.50 oz. of silver. During these sales, on account of the German treasury, it fell in value, and at one time in 1878 it was sold at 49d. an ounce. From this it rallied slightly when the Germany treasury was deterred from further sales by heavy losses, but it again declined.

The influence of Germany's action was felt in other quarters than the silver market, and its results everywhere had the effect of increasing the depression of silver. In 1873 Denmark, Sweden, and Norway followed her in adopting the single gold standard, and altho the amount of their coin circulation is not large—the new gold coinage of 1872 amounting to but \$20,021,055 in value—the act served to inflict a fresh blow on the prestige of silver. Holland followed in 1875. In the United States, the influence of the bankers and capitalists had already caused the withdrawal of the greenbacks, the issue of interest-bearing bonds, the vote to pay both capital and interest in gold (altho in some cases it had not been promised to be paid in gold), and, besides all this, the gradual contraction of the currency; and thus, of course, the enhancement of the value of gold. For the details of this we must refer the reader to the article CURRENCY; but it must be at least mentioned in any true history of the bimetallic controversy as one important factor. Hitherto silver, since the beginning of the war at least, had played a small part in United States monetary affairs. During the war, and till about 1876, it was mainly a question of paper or gold. This led to unforeseen consequences. Silver—hitherto technically altho not practically a legal tender and standard of value—was, in 1873, technically demonetized. (See CURRENCY.) A bill was introduced into Congress and passed February 12, 1873, nominally to regulate details of coinage at the mint, but which, without mentioning the demonetization of silver, did practically accomplish

**Silver
Demon-
etized,
1873.**

this by not mentioning silver coins except for small change, and saying that no coins either of gold or silver should be coined except those therein set forth. It elicited at the time small attention. Few knew that it demonetized silver, and the most stalwart friends of silver voted for it. Silver was scarcely an issue.

But gradually, as the country saw the circulation contracting, and the opponents of contraction found that they could not obtain a paper currency, they turned to silver, and then discovered that it had been demonetized. The excitement was intense. Mr. Sherman and the few who knew what had been done were branded as traitors by the growing friends of silver. It was charged that demonetization had been carried by a conspiracy of a few Congressmen with the "gold kings" of Wall Street, to carry out "a world conspiracy" to demonetize silver and make gold the ruler of the world.

A monetary commission was appointed by

Congress in 1876, which reported strongly in favor of silver, and led to the call of an international monetary conference at Paris in 1878, to secure the cooperation of the European powers in remonetizing silver. Meanwhile, the development of gold monometallism had gone on. Says President Andrews, in the *Political Science Quarterly*, June, 1893:

"On December 18, 1873, fearing a disastrous influx of the metal from Germany, Belgium suspended the free coinage of silver, the other States of the Latin Union (*q.v.*) following on January 31, 1874. Holland, too, this same year, gave up coining silver for private account. On December 21, 1876, Belgium wholly ceased striking standard silver coins. Russia took the same course also in 1876; France and Switzerland in 1877; Italy a little later.

"Nearly at the same time with these changes, demonetizing silver and requiring new gold, the flow of silver to the East decreased, and the yield of the American silver mines increased. Both phenomena tended to depress the value of silver and to lower its price in gold. Early in November, 1872, for the first time since 1852, silver sold in London under 60d. per ounce. In 1871, silver prices for the year being averaged, 15.58 grs. of silver would buy a grain of gold. In 1872 it took 15.63 grs. of silver to do this; in 1873, 15.92 grs.; in 1874, 16.17 grs.; in 1875, 16.58 grs.; in 1876, 17.88 grs.; in 1878, 17.94 grs.; in 1879, 18.40 grs."

The Paris conference took no positive action toward silver remonetization. In the United States, however, the Bland Bill of 1878 did to an extent remonetize silver. It did not wholly, for altho, as originally reported by Mr. Bland from the House Committee on Coinage, it did propose the full remonetization of silver by authorizing its unlimited coinage at the ratio of 1 to 16 on private account, the bill, as finally passed, restricted coinage to \$2,000,000 a month on Government account. And the secretaries of our treasury, like the Bank of France, have been agreed in regarding their stock of gold alone as the reserve for the security of the notes they are obligated to redeem on presentation.

This was at length replaced in 1890, after almost annual attempts at a full free-coinage act, by a compromise measure, commonly known as the Sherman Act. This directed the Treasurer to purchase silver bullion aggregating 4,500,000 oz. a month, or so much thereof as might be offered at market price, and to issue in payment for such purchases silver bullion treasury notes.

Meanwhile, on the Continent the gold monometallists had succeeded in permanently demonetizing silver. By an international agreement of the Latin Union, in 1874 the coinage of silver had been limited; by an agreement of 1877 it ceased. The Paris conference of 1878 had been decided for gold, and tho the conference of 1881 showed a little more inclination toward silver, the reluctance of the greater European powers still carried the day for gold. (See MONETARY CONFERENCES.)

We now come to the money crisis of the summer of 1893. The United States was left alone, of the great powers of the world, to deal with silver. Various events conspired to bring on this crisis. Losses on loans in the Argentine Repub-

lic compelled England to draw in her gold. Then came the failure of the Australian banks, demanding more gold from England.

**Crisis of
1893.**

Austria-Hungary and Roumania decided to change to a gold standard. On the top of all this, the English Indian Government was induced (June 26, 1893) to stop the free coinage of silver. The crisis in America almost immediately followed. Silver dropped to the lowest point ever recorded. The day after the news from India, silver mines began to close in Colorado, and distress became intense. Meanwhile, some of the banks, not knowing what was coming, had begun a policy for which many of them dearly paid. It is claimed by the silver extremists that the banks, or at least some bankers, planned, by reducing their circulation and by refusing credit, to create a slight pinch, to lay this to lack of confidence in the Sherman Act, and fear that the United States would be left to a depreciated silver standard when all the rest of the world had declared for gold, and so to compel Congress to repeal the Sherman Act and thus put the whole world in the hands of the triumphant gold metallists, as all the great powers, except the United States, are to-day. However, the banks did not know what elements were uniting to cause, not a slight pinch, but the worst monetary crisis the country has known for at least 20 years. Finding credit refused, the public became fearful. Men began to draw out their capital and hoard money. Western banks failed in large numbers. Lack of confidence in silver was preached by the papers as the cause of the panic. The repeal of the Sherman Act was demanded by all the banks, boards of trade, and capitalists. President Cleveland was induced to summon an extra session of Congress to meet the emergency. All this increased the panic. Credit was gone. Money was hoarded. It became impossible even for perfectly solvent manufacturing concerns to get enough money to pay their wages. Every device was used for money. Clearing-house notes were issued in large quantities. Banks in unprecedented numbers failed, altho with abundant assets, because they could not get currency to meet the demand. There was a money famine. The calling of Congress (August 7) strengthened confidence temporarily. Large amounts of gold were obtained from England, and a little easement made. August 11 Mr. Wilson, of West Virginia, introduced a bill in the House, repealing the silver-purchasing clause of the Sherman Act, but renewing the pledge to maintain the parity of gold and silver. This passed the House August 23 by a vote of 240 to 110. Then came a long contest in the Senate. After much discussion in committee and caucus, Senator Vorhees introduced a bill, August 18, repealing the purchasing clause, but more strongly pledging the maintenance of bimetallism. Strongly supported by the Administration, it was nearly defeated by the persistent and strenuous opposition of a bitter and able minority, and the inability of the majority—for political and other reasons—to agree to changing the traditions of the Senate and force a vote. Finally, however, after months of talk, it passed the Senate, October 30, was accepted

by the House, and approved by the President November 1. Such is a brief outline of the monetary history, from which the bimetallist controversy cannot be separated, and without a knowledge of which it cannot be understood.

Since November, 1893, the bimetallist controversy has been intensified rather than diminished, but the history is best considered under article SILVER, since it has turned more upon fact than upon theory.

In this country, however, the bimetallists must not be confounded with those friends of silver who have fought for bimetallism, not from any theory or belief in bimetallism itself, but simply from a desire to expand or at least to prevent the contraction of the currency, and have believed the use of silver to be at present the most available means to this end. By no means have all the supporters of silver in the Congressional battle been bimetallists.

**Bimetallists
and Free
Silver Men
not the
Same.**

On the other hand, by no means have all the opponents of silver been monometallists. On the contrary, many of them believe in bimetallism, but have argued that the United States cannot afford to use depreciated silver when all the rest of the world is using gold. They have held that we must adopt the gold standard, and then work for an international agreement to use silver. A few strong bimetallists, including such an eminent monetary authority as President Andrews, have urged the adoption of the gold standard by the United States, on the ground that there is not gold enough in the world to do the business of the world; so that for the United States to adopt it would necessarily produce such a panic that even England (where there has been of late considerable awakening of inclination toward silver) would be compelled to adopt silver. Still others have argued for the repeal of the Sherman Act, on the ground that it was a compromise measure, in itself pleasing to neither believers in silver nor in gold, and that, since it has been at least presented as the cause of lack of confidence, to repeal it would tend to restore that confidence; while the country could then legislate, as it would, to increase the currency. On the other hand, those arguing against repeal, in the interest of an enlarged currency, have insisted that, altho they did not like the Sherman Act, it was all that stood between them and a single gold standard, and it was, therefore, folly to repeal it till they could be assured of something better to take its place; while it would be folly, when there was already a money famine, to repeal a bill calculated to put at least large amounts of silver certificates into circulation every month. It will be thus seen how complicated has been the condition of the bimetallic controversy in the United States. And this is but a brief statement of the subject. The intensity of feeling on the subject can only be realized when one reads the violent language of the friends of silver, classing the gold men with the most heinous traitors to the country, and threatening violence and war if silver be demonetized. This feeling, however one differ from it, can, nevertheless, be understood when one realizes what a contracting currency means, and how these men believe that the de-

monetization of silver is a deliberate plot to contract the currency. For this we must refer the reader to article **CONTRACTION AND EXPANSION OF CURRENCY**. We here simply quote from Professor John R. Commons, of the University of Indiana, who says :

"Money is like any commodity, in that its value is determined by demand and supply. If money is scarce, compared with the demand, its value will be high, which is the same as to say that prices of commodities will be low, and if money is abundant, it will be cheap, and prices will be high. Now . . . what is the significance of price fluctuations? Nothing less than the very essence of modern industry. In former days, when every man lived to himself, there was no occasion for a money question. But now no man or family lives isolated. The 'cash-nexus,' at least, unites the world into a single organism. Each one buys from the world all that he eats and wears and enjoys, and sells to the world the one specialized product which he makes. His whole life, therefore, is a question of prices. Also, it is estimated that the debts of the world are \$100,000,000,000. Every nation, state, county, city, and township is in debt. Every business man, corporation, farmer, is a debtor. These debts run from three months to three decades. All business and productive enterprises are a speculation. The farmer borrows money expecting to sell wheat at a certain price and pay his debt in money. Meanwhile the price of wheat falls 50 per cent. Where one bushel would have paid his debt when contracted, it now requires two bushels, and the burden of the debt has grown 100 per cent. During the past 20 years this is exactly what has occurred. Our universal, all-important standard of measure has doubled. Every debtor and producing nation except the United States is a bankrupt nation. They borrowed money for private and public enterprises when prices were high, and must pay interest and principal when prices are low. Australia, with its bountiful resources and immunity from war; Egypt, Italy, Portugal, Argentina, are acknowledged bankrupts. France, Spain, and other nations escape the acknowledgment only by falsely doctoring their books. The reason is, the burden of their debts has nearly doubled. The people of the United States have paid two thirds of their war debt since 1865; yet, measured in wheat, cotton, corn, and many manufactured articles, it will require to-day more of the products of their muscle and brain to pay the remaining one third than it required in 1865 to pay the entire debt. Only a land of fabulous resources can endure this fruitless slavery. When we consider that the private debts of the country are one half the value of the country, it is no wonder that panic, depression, idleness, and despair are upon us" (article in *The Voice*, September 14, 1893).

Importance of the Question.

It can be thus seen what the bimetallic controversy really means, and why it has roused the farmers, who are a debtor class, to such intense excitement and sometimes frenzy. It means, in their belief, the doubling or halving of their debts, the consequent salvation or ruin of home, family, and their future for years to come. It is no wonder that the controversy has been called the greatest problem of modern political economy. (For the more recent history of the question, see **SILVER**.) In regard to the bearing of bimetalism upon the recent loans contracted by the United States Government, the following from *The Outlook* of March 2, 1895, gives the argument *pro* and *con* :

"The monometallist claims, with considerable show of reason, that the recent act of the Administration in borrowing \$62,400,000 of gold, on terms which involve the payment of over \$72,000,000 in interest in 30 years, was absolutely necessary to preserve the credit and honor of the Government. It is said that we are under a political and commercial necessity, if not under a moral and legal obligation, to redeem all our notes, except the silver certificates, in gold; that the gold in the treasury had been so drawn out that it was necessary for the Government to borrow gold in order to redeem its promises; that if it borrowed this gold

by a popular loan from Americans at home, the Americans would straightway sell the bonds for greenbacks, and use the greenbacks to draw out from the treasury the gold which they had put into the treasury; that to prevent this depletion it was necessary to find some owners of gold who would not exchange the bonds for greenbacks and use the greenbacks to draw out the gold again from the treasury; and that these owners of the gold, having a control of the gold, have both the power and the right to charge the rate of interest which was charged and is to be paid by the Government. If the Government were in war and needed potatoes for its army, it would have to buy the potatoes of the farmers who had them, and it would have to pay the farmers whatever price they asked. It is in need of gold, and it must buy the gold of the bankers who have it, and must pay the bankers whatever price they ask. This is the argument, and whether it is wholly correct in its assumption of facts or not, these assumptions are not wholly unreasonable.

"We have stated on another page our reasons for thinking that the bargain was not a wise one; but if it were, if the facts are as claimed by the monometallist, and the action of the Administration was necessitated by the conditions that existed, these facts and these conditions furnish to the bimetalist an additional argument for bimetalism.

"We have in this country, in various forms of paper money, \$1,500,000,000. We have in addition to this a great credit system carried on by means of checks and bills of exchange, which, at the lowest estimate, aggregate \$2,000,000,000 more. Under a monometallic system this whole medium of exchange—National notes, banknotes, and private checks—is based upon gold, and every note and check is, in the last analysis, payable in gold. There is so little gold in the world that a comparatively small number of bankers can control the supply in any time of exigency, and can compel the people to pay a large interest account, not for gold to be used as a medium of exchange, for they do not use gold for that purpose, but for the privilege of maintaining a medium of exchange consisting almost wholly of paper, but based upon gold as a standard. The bimetalists claim that if this medium of exchange consisting of paper were based, not upon gold only, but upon both gold and silver, there is so much of both metals in the world that no banker or syndicate of bankers could control the supply, and that, therefore, the people would not be required to pay to any banker or syndicate of bankers \$72,000,000 in 30 years for the privilege of carrying on their exchanges by means of notes and checks."

ARGUMENTS FOR BIMETALLISM.

In following the monetary history of the bimetallic controversy we have already seen many of the arguments *pro* and *con* ; but as that history is confused with other questions, we tabulate here the main arguments for bimetalism.

1. That there is not enough gold produced in the world to do the business of the world, and that, therefore, unless silver or some other metal be used, the sufferings must be experienced which all economists are agreed would result from a contracting or insufficient currency. Upon the gold production of the world Soetbeer and Giffen are admittedly the greatest authorities. Soetbeer's tables, translated by Professor Taussig, and published in the United States Consular Reports for December, 1887, p. 528, are condensed as follows :

	Gold Produced (yearly).	Consumed in the Arts.	Used for Money and Reserves.
1851-70.	\$135,000,000	\$43,000,000	\$92,000,000
1881-85.	104,000,000	80,000,000	24,000,000

In other words, while the production of gold had decreased, its non-monetary consumption had nearly doubled, and the surplus available for money uses had been reduced from \$92,000,000 annually, two decades before, to \$24,000,000 annually in 1885.

Mr. Giffen, the leading English monometallicist, has since written upon the same question,

as follows: "About two-thirds of the gold produced annually is taken for the arts, and if the consumption of India is included as being either for simple hoarding or for the arts, and in no case for the purpose of circulating money, then the demand for gold for non-monetary purposes appears almost equal to the entire annual production."

With these statements from such sources the contention seems supported that there is not enough gold produced in the world to do the world's business, and that silver is, therefore, needed.

2. It is urged that silver is less liable to fluctuation in value than gold, and that, therefore, when used with gold, it tends to modify the evils of gold fluctuation. For the facts bearing upon this point, which are somewhat involved, we must refer the reader to SILVER.

3. Bimetallists argue that even if this be not the case, on general principles two metals are not so apt to fluctuate as one, and that if one metal be driven out of circulation temporarily, the other metal will remain, fluctuating perhaps, but still fluctuating less than the vanished metal. Jevons has illustrated this as follows:

"At any moment the standard of value is doubtless one metal or the other, and not both; yet the fact that there is an alternation tends to make each vary much less than it would otherwise do. It cannot prevent both metals from falling or rising in value compared with other commodities, but it can throw variations of supply and demand over a larger area, instead of leaving each metal to be affected merely by its own accidents. Imagine two reservoirs of water, each subject to independent variations of supply and demand. In the absence of any connecting pipe, the level of the water in each reservoir will be subject to its own fluctuations only. But if we open a connection, the water in both will assume a certain level, and the effects of any excessive supply or demand will be distributed over the whole area of both reservoirs. The mass of the metals, gold and silver, circulating in Western Europe in late years, is exactly represented by the water in these reservoirs, and the connecting pipe is the law of the seventh Germinal, An. xi. (1803), which enables one metal to take the place of the other as an unlimited legal tender."

4. Bimetallists claim, as asserted above, that the depreciation of silver which has taken place has been due to unfavorable legislation, and that all the financial suffering which it has caused proves what need the world has of silver. If this goes on, they argue, nothing less than a most disastrous shock to the expansion of the world's commerce can be expected. And no remedy except the remonetization of silver has been suggested. (For a fuller statement of the arguments for bimetallism, see MONETARY CONFERENCES.)

We close this portion of our subject by quoting the declaration of the bimetallist members of the German Silver Commission, printed in an appendix to the record of the twenty-first session, as translated by E. Benjamin Andrews, and published in the *Review of Reviews* for September, 1894:

"The undersigned, members of the German Silver Commission, believe themselves compelled to draw from the course of the Commission's proceedings the following conclusions:

INCREASED PURCHASING POWER OF GOLD.

"I. We consider it proved by science and experience, and partly, in fact, by the admissions of prominent adherents of the sole gold standard, that the power of

gold to purchase goods has risen since the general extension of the gold standard (1873), is still rising to-day, and must continue to rise.

"Our grounds for this belief are:

"1. The rise in the purchasing power of gold, that is, the general fall in the price level of commodities, was predicted by the well-known monetary writers, Wolowski and Ernst Seyd, in 1868, before the introduction of the gold standard. Their prophecy was repeated later by E. de Laveleye and Carey. Even Dr. Bamberger said, in the session of the Reichstag May 29, 1873, according to the stenographic report: 'On the contrary, gentlemen, I fully agree with one of the speakers who have preceded me, that a greater demand for gold will result from our gold policy and the similar policies adopted by other countries. Gold will then rise, and a consequence of our currency reform will be that prices with us, if we once go over to the gold standard, will decline.' Robert Giffen, recognized as one of the best authorities of the gold-standard party, declared in 1888: 'If events are the touchstones of prophecies, no prophecy was ever more certain than the increased dearness of gold. That the fall of prices throughout a compass so general as that in which we now see it falling is to be referred to an elevation in the purchasing power of gold is generally, and I might almost say universally, admitted.'

"2. The attempt to refer this lowering in the general level of prices to other causes, lying outside the coinage system, for instance, to cheapening and improvement in means of communication, to the perfecting of processes and machines for the production of goods, etc., must be considered a failure, for the reason that the same causes were present in the same strength during the twenty-year period before 1873, tho at that time there was observable a gradual elevation in the prices of goods in general; while, since 1873, that is, since the beginning of the fall in the gold price of silver through the introduction of the gold standard in Germany, a sharp and permanent lowering in general prices has come in.

"Moreover, the industrial development referred to is at present specially strong in the lands having the silver standard, yet without inducing any fall of prices there. This is a direct proof that silver has not lost in value, but merely gone down in its gold price, and that, therefore, the fact which confronts us is simply an elevation in the value of gold.

"3. The objection that many things, as city rents, securities, and, most of all, wages, have increased in price is without weight, because in all these things powerful special factors have been influencing prices. City rents must advance so long as the population of the country continues to be drained away into the larger towns, evoking a permanent increase in the demand for houses. Securities advance in accordance with the increase in the purchasing power of the income which they yield. The prostration of productive industry lessens the demand for capital for productive purposes and increases the demand for those securities whose interest is certain to be paid. Wages rise with the elevation of the standard of life in the different classes of the population, altho the full satisfaction of the demand thus originated is made impossible by the bad industrial position of employers. The social bitterness proceeding from this unsatisfied demand is mostly a result of the pressure with which a bad coinage system afflicts the entire life of industry.

RESULTING EVILS.

"II. The advance in the purchasing power of gold, proved in our judgment beyond refutation, brought about by the disuse of full silver money and the adoption of a gold standard, has demonstrably produced the following industrial evils:

"1. An incessantly heavier and heavier burden is falling on the debtor in favor of the creditor. In respect to this Archbishop Walsh, of Dublin, remarks: 'A great part of the capital employed in the business of our land has passed into the hands of creditors who have neither toiled nor spun, but hold securities and mortgages. The discouragement caused by this state of things is very deep. After it has continued a number of years a sense of hopelessness masters the entire business world; all desire to undertake business enterprises is paralyzed; a multitude of establishments are closed; the laborer is forced out of work; and laborers, as well as the whole middle class of the population, are made to feel that a great misfortune has come over them. The result, in fact, reaches still farther: a crowd of people who were once well-to-do in business have now become recipients of alms.'

"2. This injury to the debtor must at last involve the creditor, since the debtor is becoming unable to pay.

"3. A set-back to German agriculture is manifest, referable, on the one hand, to the necessity of selling a constantly increasing amount of depreciated agricultural products in order to pay wages, interest, rent, leases, taxes; and, on the other hand, to the increased power of competition on the part of other countries, silver countries, that is, and countries on a money basis of depreciated paper. In proportion as their silver or paper loses in power to buy gold, these countries, enjoying in effect a high export premium, are able to throw their native products upon the world's markets at prices far beneath what it costs German farmers to produce them, so plunging these latter in deep distress.

"4. The demonetization of silver is also working a more and more visible injury to German manufacturing industry:

(a) On account of the ever-lessening ability of the farmer class to purchase manufactured products.

(b) On account of the decrease in exports to silver lands and of the consequent recoil upon the home market of the articles hitherto exported thither.

(c) On account of the competition offered by the rapidly developing manufacturing plants of silver lands, favored by the low cost of production there and by the premium upon exportation therefrom produced by the fall in the gold price of silver.

"Unless means are taken to prevent, it will not be long before the manufactured products of the silver countries will find the German market. To import Indian yarn into Germany is already a paying operation.

"5. A suppression of the desire to engage in industry is the natural result of falling prices. Instead of being applied to undertakings that are for the people's economic advantage, capital seeks investment in securities considered certain to pay interest. Lower rates of interest result. In order not to suffer from this, uncertain foreign securities are purchased, occasioning heavy losses of German capital, especially bad for small investors.

"6. Capital cannot permanently keep clear of the injuries which debtors suffer, nor can it remain unaffected by the falling off of production. Obligations made payable in gold lead to the bankruptcy of individuals, as well as of States [Greece, Portugal, Argentina].

"7. Constantly increasing difficulty besets countries which are financially involved by having gold debts to pay. Instead of being able to reduce their finances to order, they are confronted with an increasing agio upon gold, and also, corresponding to this, with an increase of the premium upon the products which they export. This exportation, moreover, is to the disadvantage of the manufactures and the agriculture of the lands having the gold standard.

"8. There results a permanent injury and exhaustion of Germany's silver-mining industry, which cannot be normally carried on at the present prices of silver. But as silver mining ceases there also ceases in great part the production of copper, lead, zinc, etc. In this way many millions are yearly lost to the income of the German nation; many thousands of laborers are deprived of bread; entire districts of Germany are ruined.

"9. A falling off amounting to billions is taking place in the value of the nation's land and soil, threatening particularly the agricultural districts of the eastern provinces; while the growth taking place in the great cities and manufacturing centers is going on in an unhealthy way. Increasing discontent is overpowering the population, showing itself in the progress of socialistic democracy and also in the anti-Semitic movement, which E. de Laveleye foretold as a result of introducing the gold standard.

"10. The depopulation of the rural sections means a weakening of the German military power. In case of war, our financial preparations are entirely unsatisfactory. That other countries are quite as badly off as we in this respect affords no satisfaction.

"11. The fall in the gold price of silver severely endangers our monetary circulation. We have in circulation nearly 1,000,000,000 marks (face value) in thalers, small silver pieces, nickel and copper money, whose bullion value in all hardly exceeds 400,000,000 marks. This condition gives rise to a double danger—*viz.*, that our monetary system may break down at critical times, and that counterfeit full legal-tender silver coins may be circulated, indistinguishable from those struck at the public mints, a process, at the present low gold price of silver, affording counterfeiters enormous profits. It is known that vast counterfeit issues are already in circulation in other countries.

"12. All these evils lead every now and then to

crises, which disturb business by raising rates of discount, resorted to in order to protect gold, which all banks anxiously do, for the most part withdrawing it from commerce by an embargo.

"13. Beyond all question we have to anticipate a still more acute development of these evils. All the silver countries must try to place themselves on the gold basis if Germany and the rest of the great powers hold fast thereto. Modern commerce cannot permanently endure a difference in basal moneys, the separation of the world into gold countries and silver countries. But any further extension of the gold system must, as Goschen predicted so early as 1873, lead to a business crisis such as the world has never yet passed through.

ADVANTAGES FROM REMONETIZATION OF SILVER.

"III. Nothing but a restitution of silver to its former coequality with gold as a monetary metal can bring the needed relief.

"We promise ourselves the following benign results in case of such restitution:

"1. The persistent fall of general prices would cease, the prices of all products would again be determined in a normal way, and agriculture and other industries would flourish anew.

"People's fears touching money depreciation, inflation, and injury to creditors, supposing silver to be restored, rest upon exaggerations. International free coinage would at most leave barely enough excess of gold and silver over the industrial demand to keep pace with the increase of business and population, and with the constant addition of new countries to the civilized portion of the world. The precious metal production with which we now have to reckon is, in fact, proportionally to the various demands which would be made upon it very much less than that of the fifties and the sixties, which then brought rich economic blessing and did no injury whatever.

"2. When prices rise, both the impulse to undertake industrial enterprises and the rate of interest also rise, working an advantage to capital which fully makes good any possible diminution in the purchasing power of money. Public income swells, permitting an advance in the salaries of officials. A flourishing condition of general industry enhances the demand for labor and betters the situation of the laboring classes.

"3. Were it possible to make specie payments in silver as well as in gold, it would be easier for countries with depreciated paper money to regulate their finances. Many can never accomplish this in any other way. Variations in paper money values would then no longer curse commerce; the products of German industry would be in vast amounts exported to silver lands (East Asia, Mexico, South America), and at the same time the ability of our agricultural population to buy goods would be restored.

"4. A period of general advance in material prosperity would rob of all significance the agrarian, anti-Semitic, and Socialist-Democrat movements of agitators, and prevent the mutual bitterness of our political factions from becoming, as it now threatens to become, more acute.

"5. Instead of the separate measures of value now actually in use by the world's commerce, gold alone in some countries and silver alone in others, there would be a single measure of value for all mankind, that secured through gold and silver together, by rendering invariable their values relatively to one another. That this fixity in the relative values of gold and silver can be brought about is proved by history, for it actually prevailed from 1803 to 1873, owing to the mintage of both metals by France. That it is possible by a union between the chief commercial governments to establish a practically unchanging relation in value between silver and gold was unanimously recognized, after long investigation, by the English gold and silver commission of 1888.

OBJECTIONS CONSIDERED.

"The objections against the above opinions of ours seem to us to lack sufficient foundation.

"1. If it be said that the restitution of silver as a monetary metal is possible, or possible in accordance with justice to creditors, only by rating silver to gold at its present market value in gold, we reply that the market price of silver to-day is abnormal, resulting from a series of panics evoked by legislation, and from a limitation in the demand for silver having no other cause than the artificial one of closing mints to this metal. Besides, it cannot be admitted that the creditor

has any natural right permanently to receive at the debtor's cost, in consequence of the steady rise in the purchase power of gold, a value continually more and more in excess of what would fall to him were there no such appreciation of gold.

"2. In reply to the objection, resting on misunderstood theories, that the relation in value between two 'wares,' gold and silver, cannot be 'fixed' by statute, we appeal to actual experiences with bimetallic mintage in France, where, between 1803 and 1873, it maintained for the whole world the relation of 15½ to 1, thus persistently continuing the relative value of gold and silver, with slight variations corresponding to the usual movements of exchange, in spite of the greatest fluctuations in their relative production that have ever been known.

"We appeal further to the unanimous judgment at which the English Gold and Silver Commission of 1883 arrived, altho' half its members were opposed to bimetalism. Here is what the Commission says:

"We think that in any conditions fairly to be contemplated in the future, so far as we can forecast them from the experience of the past, a stable ratio might be maintained if the nations we have alluded to (Great Britain, the United States, Germany, and the Latin Union) were to accept and strictly adhere to bimetalism at the suggested ratio. We think that if in all these countries gold and silver could be freely coined, and thus become exchangeable against commodities at the fixed ratio, the market value of silver as measured by gold would conform to that ratio and not vary to any material extent.

"We need not enter upon any extended explanation of our reasons for this view, since such reasons can be derived from what we have set forth above, and since, in our opinion, they obviously follow both from theoretical considerations and from the experience of the last half century.

"It in fact appears impossible to maintain any other view."

"3. If it is objected that the restitution of silver would occasion for Germany a crisis whose limits could not be foreseen, it must be noticed in the first place that we do not believe in any interposition on behalf of silver *save on the basis of an international agreement*. No sort of distrust can be occasioned by bimetalism when it is introduced simultaneously in all the great nations.

"Besides, the fear of a 'flood' of silver is entirely groundless.

"(a) Because not an increase but a decrease in silver production is now in prospect;

"(b) Because the silver in the silver countries (East Asia, Mexico) and in circulation as money in the gold lands has not yet become depreciated. The billions which circulate as thalers, marks, francs, shillings, and guilders still hold fast their old value;

"(c) Because compared with the tremendous stocks of precious metal in the world, which, including wrought gold and silver, are valued at 100,000,000,000 frs. (\$20,000,000,000), the yearly production is insignificantly small;

"(d) Because the severe and long-continued crisis has naturally reduced the demands of business on the stock of gold and silver coins, and in a period of flourishing industry this demand will greatly rise.

"But the speedy establishment of international bimetalism seems to us necessary more particularly in view of the facts concerning the production of the precious metals.

"The testimony of expert geologists has strengthened us in our conviction that gold is not adapted to be alone the measure of value, and that the fears of a too great production of silver are utterly unjustified.

"Experts have unanimously declared:

"(a) That the large production of silver in Australia is a transitory phenomenon, whose end is but a little way in the future;

"(b) That silver production is at present rapidly falling off in the United States, not only in consequence of the fall in gold price, but as well because the bonanzas and also the carbonate ores necessary for smelting are becoming exhausted;

"(c) That a permanently large production of silver is to be expected only in Mexico and South America, where, because these countries are on the silver basis, the gold price of silver has, in our belief, no effect in checking the production of the metal.

"As against the view prevalent in our country that the gold price of silver fell because of increase in production, it is certain that this fall is to be referred entirely to the doings of legislators; that when the fall began the production of silver was, in fact, not sufficient to meet the demand; and that the American silver laws led to a 'skinning' of the silver mines, which was the

main cause of the increase in production. Let normal conditions return, and we may expect a stable production of silver, corresponding to the vast demand, tho' hardly sufficient to satisfy it.

"The production of gold has greatly increased in the last few years, yet not in a way to equal the demand so long as gold alone is full money. Should the gold States at last be driven to go on and lay aside their many billions of silver money, continually losing more and more of its gold value, it would be absolutely impossible to fill the gap so caused in their circulation.

"But the production of gold cannot maintain itself at its present height. The more strongly and intensively the extraction of gold is pushed, so much more rapidly and completely will the mines be exhausted. The allegations of Professor Ed. Suess in reference to the prospective exhaustion of gold mines have not been proved incorrect, but have been confirmed; and Suess, when before the Commission, only strengthened us in his views when he declared that the present copious production of gold is bringing the world essentially nearer to the moment assumed by him when the production of gold will be entirely at an end.

"In the Transvaal, according to microscopic investigations, it is only a question of fossil 'soaps' (alluvial or diluvial gold). The wealth of gold there, therefore, does not refute but confirms Suess' doctrine that important treasures in gold are to be found only in newly opened countries, where they quickly give out.

"People still refer to the possibility of further 'surprises' in respect to gold production. This possibility is all the time growing less and less with men's restlessly advancing examination of the earth's surface.

"The gold production of to-day, inadequate as it is, is rapidly using up the world's last great gold reserves. To build the world's coinage system upon a production which can at best last only some decades is as impossible as a coinage system based upon the chance of 'surprises.'

"A provident statesmanship cannot discredit silver and let it lose its value, when all human foresight is to the effect that the metal will be absolutely indispensable in the future.

"The present moment, witnessing an increase in gold production which may be the last, is precisely the time to carry through an international system of bimetalism, as this can now be done without any fear that gold will leave the circulation or attain an agio. Those who prophesy a gold agio in case of bimetalism overlook the fact that they thereby ascribe to gold a scarcity and dearness too great to allow of gold possibly continuing the sole standard.

"If, now, the united German governments recognize the necessity of procedure to stop the depreciation of silver, it comports with the high position of Germany as a nation that it should assume the initiative toward international negotiations, exerting its influence in the council of the nations in favor of silver, whose depreciation had its beginning in the German coinage law of 1871. Such is the condition of affairs that Germany will be permitted to reckon upon the cooperation of all powerful States, including England.

"VON SCHALSCHA,
"WÜLFING."

ARGUMENTS AGAINST BIMETALLISM.

These come from two main sources: (1) From those who believe in a gold monometallism, and (2) from those who consider *both* monometallism and bimetalism to be faulty, and would meet the monetary need in other ways. The argument brought by monometallists against bimetalism will be found at length under the division of *Monometallism in Money*, but may be summarized here. It is urged that, however we legislate, two metals cannot be a standard at the same time, because at any given time, according to Gresham's law (see *MONEY*), the poorer metal will drive the better metal out. If, then, it is said we attempt to have a double standard, it really means to choose the poorer standard of the two, and thus to have all the evils of a depreciated and depreciating cur-

rency. It is urged that the fall of prices has not been due to the appreciation of gold, as bimetallicists assert, but to the cheapening cost of production. Monometallists point to the danger of there being such an increased production of silver as to threaten great depreciation of its value; and therefore, if accepted as a standard, the great lessening of money values, involving general financial ruin. The only way to prevent this, they urge, is to maintain gold as the most fixed and universally accepted measure of value, and then to use various forms of credit to do the exchange of the world where gold is not sufficient, using silver, copper, etc., only for subsidiary coin. Already, they assert, credit performs 93 per cent. of the exchanges of the world. (Bimetallicists deny this, and say that monometallists consider too much the methods of the financing class. They say that the vast millions of the earth's population do not use forms of credit; that retail stores use it little, farmers still less, and artisans and day laborers scarcely at all. For these credit is no relief, since they have no credit. Credit, moreover, gives out when it is most needed, and throws the world back on an insufficient amount of gold just when gold is most in demand.)

The argument against bimetallicism by those who would have neither bimetallicism nor monometallism is (1) that bimetallicism has not worked and cannot work without international agreement, and that this is well nigh impossible to get, it always being the interest of the capitalists of one nation to adopt a gold standard if they can only induce some other nation to adopt a silver standard; (2) that there is large measure of truth in the contention of the monometallists that there cannot be two standards at the same time, and that to try to attempt to have two standards is really to have only the poorer of the two; so that the best that can be said for bimetallicism is that it is an evil only less than that of an insufficient gold standard; (3) that the great need in currency is of a fixed standard, which, to remain fixed in proportion to prices, must be elastic in *volume*, which is possible neither with gold nor silver; so that we require some better system than either monometallism or bimetallicism. (For a discussion of proposed systems, see MONEY, last part.)

On continental Europe, the most distinguished bimetallicists have been Henri Cernuschi,

A. Wagner, A. Schäffle, Baron von Kardoff, Professor E. de Laveleye.

Leading Bimetallicists. In England till recently most of the economists were monometallists, but there has come a change.

Says a writer in the *Christian Union* for September 2, 1893:

"Newton, Ricardo and Chevalier were in favor of silver monometallism. Mills, Cairnes and Jevons were in favor of gold monometallism. What was true of the great writers was also true of the rank and file of university professors. In the early seventies, however, when the production of gold began to fall off, and one new nation after another discarded silver and established the gold standard, prices which had been nearly uniform for 20 years began steadily to fall. This brought a new current of thought into the scientific world. There are still scientific monometallists, but there is none of the rank of the men we have named. The revolution of opinion has been quite marked in Germany, where Wagner and Schäffle, the two economists of the widest fame, are both bimetallicists. It

has, however, been most marked in Great Britain, where Professor Foxwell, of Cambridge, in a letter written in 1860 to M. de Laveleye, described the opinions of his colleagues in the chairs of political economy in Great Britain as follows:

"University of Cambridge, Professor Alfred Marshall, bimetallicist; Professor Sidgwick, bimetallicist. Edinburgh, Professor Nicholson, author of an excellent book on the subject, Vice-President of the Bimetallic League. Oxford, Thorold Rodgers (now dead) admits the scarcity of gold, but rejects bimetallicism. University College of London, H. S. Foxwell, Vice-President of the Bimetallic League. Nottingham, Professor J. E. Symes, bimetallicist. Liverpool, Professor E. G. Gonner, Vice-President of the Bimetallic League. Manchester, Professor J. E. Munro admits the bimetallic theory. London, Kings College, Professor Edgeworth inclines toward bimetallicism."

To these the name of Hon. G. J. Goschen should be added. In the United States the leading bimetallicists have been, in the past, Henry C. Carey, President F. A. Walker, Hon. William D. Kelley, Hon. John P. Jones, John B. Howe, and W. F. Balch.

Of the present, the situation is so involved that it is hard to speak. The large majority of professorial economists in this country are bimetallicists in theory, but believe that to be successful international agreement is necessary; and they feel that this is at present almost impossible of attainment. The position of such men as President Andrews is given above. In the confusion, to mention names and attempt classification without long explanations would perhaps mislead more than it would help.

In May, 1895, a significant bimetallic conference was held in London, but for all this recent history see SILVER.

For an able statement of the monometallist view, see F. W. Taussig's *The Silver Situation in the United States*; for the bimetallicist view, President E. B. Andrews' *An Honest Dollar*; for the position of the free silver movement, see W. J. Harvey's *Coin's Financial School* (1894). See MONETARY CONFERENCES; GOLD; SILVER MONEY; CONTRACTION AND EXPANSION OF CURRENCY; CURRENCY.

Revised by ELISHA B. ANDREWS.

BIOLOGY AND SOCIAL REFORM.—

The connection between biology and social reform is one which tends to be brought into greater prominence with the advance of knowledge. It is not long ago since the whole class

of phenomena which human society presents was regarded apart in itself and as having little or no connection with those to be observed elsewhere in the history of life. The first consistent attempt on an extended scale to connect together through the principle of development and continuity both classes of phenomena was made by Mr. Herbert Spencer. *Social Statics*, which in many respects may be regarded as the starting-point of the synthetic philosophy, dates back to 1850. One of the leading ideas in this system of philosophy—in which *First Principles*, *Principles of Biology*, *Principles of Psychology*, *Principles of Sociology*, and *Principles of Ethics* have been steps in an ascending series—has been to trace this principle of development up to and into human society. Toward the elucidation of the laws at work in this society, all the work of science in lower fields has been regarded as preliminary. It was, however, with the publication of Darwin's *Origin of Species* in November, 1859, that the greatest impetus was given to the study of human society from the biological standpoint. The full effect of this impetus is not yet felt in many departments of knowledge which are almost certainly destined to be eventually profoundly altered by it. For many years after the publication of this epoch-marking book the effect of the fructifying ideas which it contained was necessarily limited to a few departments of knowledge. Gradually, however, the circle of their influence has extended, until one after another of lower sciences, and particularly those connected with life, have been reconstructed and transformed. The principle of the continuity of development, structural and functional, is now well established; but in the long uphill battle which has had to be fought before the ideas connected with it obtained general acceptance, it has necessarily happened that the sciences connected with man in society have been the last to be influenced. But that they are now beginning to feel the effect of the revolution is evident.

**Breadth
of the
Subject.**

What we are coming to see is that in human society we have only the last and most complex chapter in the history of life. The historian, the political philosopher, the economist, and the student of ethical phenomena are all dealing with just the same problems, altho in different form, that science has been concerned with at earlier stages, and even to a large extent throughout the history of life. It is in the proposed solutions to problems connected with the distribution of wealth that we have at the present day the dividing lines which separate most of the various political parties into which our modern society is split up. It is with these problems, too, that the economist is largely concerned. Yet such problems in themselves constitute only an aspect of the highest and most complex phase of that struggle and rivalry of existence with which the biologist has already dealt on a lower plane. Some of the older economists, indeed, at times saw this more or less clearly. "Only through the principle of competition has political economy any pretension to the character of a science" was a dictum of John Stuart Mill. The point at which the social sciences tend to be most significantly influenced

by biology may be indicated. What is becoming more clearly recognized is that, as biology would lead us to expect, the conditions affecting the distribution of wealth, which the evolutionary forces at work in human society are ever tending to develop, are not necessarily those that parties or classes desire for themselves, but rather those which are continually tending to produce the highest efficiency of the whole social organization. The old utilitarian ideal of the greatest happiness of the greatest number is not, therefore, always, or even often, the same as the ideal of the greatest utility. Thus in a sense the whole of the problem before modern socialism can be stated in biological terms: Is it a movement which is tending to produce the highest standard of social efficiency, or is it one the effect of which will be to produce the maximum of ease and comfort to the largest number of individuals? The lesson of biological science for society would appear to be that, so far as it produces the latter to the exclusion of the former, to that extent it must fail of ultimate success (but see EVOLUTION). BENJAMIN KIDD.

BIRMINGHAM, ENGLAND.—"The best-governed city in the world" is the title accorded to Birmingham by Julian Ralph, writing in *Harper's Magazine*. Mr. J. T. Bunce, of the *Birmingham Post*, is quoted as saying, in his *History of the Corporation of Birmingham*, that the rate-payers are "owners of a magnificent estate and partners in vast and lucrative industrial undertakings," and that from these undertakings, "secured and maintained at moderate cost, they derive benefits possible only under a highly organized and well-administered system of communal effort, the truest form of cooperation, a real socialism, self-imposed, self-governed, conducted with the assent and by the efforts of a united community, and conducing to the equal advantage of all its members." This condition of affairs is the more noteworthy and the more deserving of the special study of students of municipal problems from the fact that it has been developed under great obstacles. Down to 1873 Birmingham's municipal government had the name of being one of the worst and most inefficient governments in England. The city was dominated by the rule of a "tavern coterie."

In 1873 came a change. In November of that year Mr. Joseph Chamberlain was elected mayor, and soon commenced an era of municipal activity. \$10,000,000 was paid for the plant of two gas companies, a large price, yet the profits the first year were \$170,000, and they have since then nearly doubled. The price, too, since 1875 has been reduced from 75 to about 50 cents per 1000 feet.

Gas Works.

Since 1880 the employees have had the eight-hour day. In 1874 the city paid \$6,750,000 for the existing water works of a private company, and since then the works have been extended, the daily supply doubled, and the cost to consumers much reduced. In 1875 Mr. Chamberlain laid before the council an Improvement Scheme, which has since been adopted, and whereby the city took 90 acres of the most crowded and most unwholesome portions of the city, covered by 4000 houses, condemned the whole district, and has opened in its place the finest public thoroughfare of the city, "Corporation Street," lined by fine business blocks. These buildings have not been sold, but leased for 75 years. The gross outlay amounted to \$8,000,000, and the annual cost for sinking fund, interest, and various charges is now about \$400,000, and the rentals \$300,000.

**Improvement
Scheme.**

but the yearly cost is lessening and the rentals are growing. In 50 years from the time of the investment the debt will all have been paid, and the city will own these structures in clear title. Mr. Chamberlain believes that Birmingham will be the richest municipal corporation in the kingdom. The investment already pays, since the death-rate of this district has been lowered, from 60 to 20 or 25 per 1000. The city has developed a fine sewerage system and a large sewage farm, a wholesome and agreeable tract of land under high cultivation and with rich crops. The average death-rate of the whole city has been reduced from 26 per 1000, in 1874, to 19 per 1000, in 1888. Birmingham was the first city in England to establish municipal baths (*q.v.*). The first was opened in 1851, at a cost of \$120,000, and there are now four, besides swimming baths, Turkish baths, etc. Birmingham in 1860 adopted the Libraries Act, and now spends \$65,000 a year for libraries, art museum and gallery, with branch libraries in all parts of the city, and 200,000 volumes. The city is well supplied with schools, including municipal technical schools, for which alone over \$30,000 a year are spent. Birmingham has laid and owns her own horse-car tracks, within the city limits, but leases them to private companies on favorable terms. The companies pay 4 per cent. on the municipal investment the first 14 years of the lease, and 3 per cent. for the remaining seven. It is calculated that in 21 years this will pay for the whole investment. As the city can borrow at 3 per cent., it is a profitable investment. The companies have to pay all bills for maintenance and repairs, and are minutely supervised as to the furnishing and lighting of the cars. The city owns her own markets, having bought them of the manorial lord in 1824, and they now yield her some \$50,000 a year profits. The city owns more than ten parks, covering 350 acres, for its population of 300,000. Its debt, which before Mr. Chamberlain became mayor was \$2,300,000, is now \$45,000,000, but it is paying itself off, and the rates are almost exactly what they were in 1873. According to Mr. Chamberlain (*Forum*, November, 1892), Birmingham spends annually, apart from appropriations for schools and almshouses, only about \$1,665,000, while Boston, with about the same population, spends \$10,194,000, and he adds that the suffrage is more universal in Birmingham than in Boston. The municipal government is conducted by 54 councilors and 18 aldermen. The councilors are elected once for three years, one third going out of office each year. The aldermen are elected by the council for six years. The mayor is elected annually by the council.

Other Municipal Enterprises.

Government.

BIRNEY, JAMES G. (1792-1857), was born in Danville, Ky. Originally a slave-holder, and at one time agent for a colonization society, in 1834 he freed his slaves and established an abolition newspaper. Fear of violence compelled him to leave Danville, and subsequently Cincinnati, whither he had moved. He came to New York, where he was Secretary of the American Anti-Slavery Society. In 1840 and 1844 he was the candidate of the Liberty Party for President. In 1842 he moved to Michigan, and a fall from his horse disabled him from further political activity.

BIRTH AND DEATH-RATES OF POPULATIONS, THE.—The two chief events of human life, birth and death, are, in nearly every civilized country, matters of careful record; and the different recorded facts connected with these events, such as sex, age, parentage, season of the year, and occupation, constitute a large portion of that branch of science known as vital statistics. We have said "nearly every civilized country," since, unfortunately, in the United States as a whole, vital statistics cannot be said to exist. At present scarcely a half-dozen States have anything which can be called a system of registration of vital statistics thoroughly enforced. The countries of Europe, however, following the example of England, where registration dates from 1838, have mostly adopted systems varying somewhat in their thoroughness and efficiency. The first American State to adopt a system was Massachusetts, and afterward came Rhode Island, Connecticut, Vermont, and New Hampshire. A few other States have registration laws partially enforced.

The birth and death-rates of any nation or community are usually expressed as a ratio per 1000 of the living population. The following statistics are presented to show the birth and death-rates of the principal European countries for a series of years, together with those of Massachusetts, Rhode Island, and New Hampshire:

The foregoing table shows that the birth-rates and death-rates of different countries present considerable variations when compared with each other, and those of each country differ considerably from year to year.

The effect of the Franco-Prussian War manifests itself in the low birth-rate of Prussia in 1871, as well as in the low birth-rate and high death-rate of France in the same year.

The effect of cholera upon the death-rate of Austria is also shown in the very high death-rate of that country in 1873.

The difference between the birth-rate and the death-rate constitutes the natural increase or decrease of any population. In most of the countries shown in the table the increase amounts to from five to 15 per 1000 of the living population annually.

A large excess of the birth-rate over the death-rate, such as exists in England and in Germany, constitutes an undoubted element of national strength. In France the excess of births over deaths is very small, and has been constantly diminishing for several years, until in 1890 there was an actual excess of deaths over births. This condition is viewed with alarm by intelligent French writers, and is termed by M. Cheysson a "national peril." He states as among the causes of the low birth-rate of France, "the growth of large towns, debauchery, overcrowding in manufacturing centers, the French law of inheritance, and the 'moral restraint' of Malthus, practised not by the poorer class, who are prolific, but by the well-to-do classes, who are systematically sterile."

The excess of the birth-rate over the death-rate in the New England States having registration is neither so high as that of England nor so low as that of France.

The actual increase of the population is governed not only by the difference between the birth and death-rates, but also by the balance between the two factors of immigration and emigration. In Ireland, for the past 40 years or

more, while the birth-rate has constantly exceeded the death-rate, the loss by emigration has been so great as to far outweigh the natural increase of the population.

War, famine, epidemics, overcrowding in cities, and bad sanitary conditions generally increase the death-rate. For many years the price of wheat has been quoted annually in the British Registration Reports, where it was shown by Dr. Fan that scarcity and high prices were not only coincident with a diminished marriage-rate, but also with an increased death-rate. In Massachusetts, during the years of war (1861-65), the natural increase of the population by excess of births over deaths fell to an annual average of 3.5 per 1000, and for the year 1864 it was only 1.3 per 1000. In the five years previous to the war an average excess of 11.5 per 1000 prevailed.

Sex.—In all countries having registration, the number of male births is uniformly greater than that of female births. The following table presents the ratio of male to female births in the several countries and States :

DEATH-RATES.

The death-rates of countries and of cities are influenced by a variety of conditions, such as sex, age, climate, occupation, and other minor causes.

Since the death-rate of females is generally less than that of males, those countries in which the females are largely in excess of the males would, other things being equal, have a lower death-rate than countries in which the sexes are equal in numbers.

The proportion of males to females in England, as well as generally throughout North-western Europe, is about 95 males to 100 females. In Central Europe, including Germany, France, and Austria, it is about 97 males to 100 females.

In Southern Europe the sexes are more nearly equal in distribution, or in the ratio of 99.2 males to 100 females, while in Greece there is a decided excess of males in the ratio of 113 to 100 females.

In the United States the males are slightly in excess, but in the New England States the females are in excess, in the ratio of 94 males to 100 females. The average death-rate of Europe, excluding Russia, for 19 years (1865-83) was 25.8 per 1000, while that of Russia was, for the same period, 35.7. Some allowance must undoubtedly be made for differences in the degree of accuracy of registration in different countries. But the average figures at the head of the columns in the table on a preceding page may be taken as fairly accurate.

ages or periods of life is shown in the following table :

DEATH-RATES PER 1,000 OF THE LIVING POPULATION AT EACH AGE AND BY SEXES.

Ages.—Age has a greater effect upon the death-rate than any other condition. In a population or community composed entirely of little children under five years of age, or of old people above the age of 70, the death-rate will be very high; while another community, composed entirely of young and vigorous persons between the ages of 10 and 20, as, for example, a large school or college, will have a death-rate considerably below that of the population at large. The vitality, or, in technical terms, the specific intensity of life, is greatest in such a community or population.

The actual death-rate for each sex at different

The general death-rate of the United States cannot be stated with accuracy, since no attempts have been made to secure registration of deaths for the whole country except in the census years, and the returns of these years are deficient. Dr. Billings estimates the death-rate of the census year for which deaths were registered (June, 1879-May, 1880, inclusive) as 18 per 1000. (For 1890, see DEATH-RATE.)

Illegitimacy.—Illegitimacy has a decided effect upon infant life. The investigations made by a parliamentary commission in 1871, relative to the mortality of such children, showed that out of the illegitimate children born in England, averaging from 60 to 70 per 1000 of all births, scarcely 10 per cent. lived to become adults. The causes of this excessive mortality were artificial nursing, neglect, poverty, ignorance, and indifference of the mothers.

Illegitimate births may be stated as a ratio of the general population, or as a ratio of the total births, or they may be compared with the number of unmarried women living at child-bearing ages, the latter being the most accurate method. The common method is the comparison with the total births.

The illegitimate birth-rate presents very great differences in different countries. The following are the illegitimate birth-rates for certain countries of Europe for the 19 years (1865-83) :

COUNTRIES HAVING VERY HIGH ILLEGITIMATE BIRTH-RATES.

COUNTRIES.	Number of Illegitimate Children in each 1,000 Births.
Bavaria.....	152
Austria.....	134
Saxony.....	132
Württemberg.....	104
Thuringia.....	101
Average.....	124

COUNTRIES HAVING LOW ILLEGITIMATE BIRTH-RATES.

COUNTRIES.	Illegitimate Children in each 1,000 Births.
Holland.....	34
Russia.....	29
Ireland.....	26
Greece.....	12
Servia.....	6
Average.....	21

In a valuable statistical paper, Sir R. W. Rawson states that the illegitimate birth-rate is in excess where the proportion of males is lowest, and also coincides with a large proportion of late marriages of females. He adds, further, that compulsory military service and large standing armies probably increase the ratio of illegitimate births.

There is a wide difference in the illegitimacy of Scotland, England, and Ireland. The proportion of illegitimate births in each for the period in question being as follows: England, 53 per 1000; Scotland, 92 per 1000; Ireland, 26 per 1000.

That illegitimacy is diminishing in England is shown by the fact that the illegitimate birth-rate for the decade 1841-50 was 67 per 1000; for the next four decades, up to 1890, it was successively 65, 61, 50, and 47 per 1000, and had still further dropped to 42 in 1891.

The illegitimate births in the Australian colonies were in earlier years less in proportion to the total births than in England, but have gradually increased, till in some of the colonies they are a little higher.

The following are the ratios in the principal colonies for a period of 18 years, ending with 1889, and for the single year 1890:

	1872-89.	1890.
Victoria.....	42.5	49.8 per 1,000 births.
New South Wales.....	43.9	53.3 " " "
Queensland.....	38.1	46.8 " " "
New Zealand.....	25.2	33.2 " " "

Illegitimacy, as might be expected, appears to be much more prevalent in urban than it is in rural populations. The following table, published by the Statistical Department of the Argentine Republic in 1886, presents the number of illegitimate births in some of the largest foreign cities.

ILLEGITIMATE BIRTHS TO EVERY 1,000 CHILDREN BORN.

Vienna.....	449	Berlin.....	154
Prague.....	439	Hamburg.....	138
Munich.....	439	Frankfurt.....	132
Stockholm.....	396	Antwerp.....	129
Buda Pesth.....	299	Cologne.....	124
Copenhagen.....	279	Naples.....	89
Paris.....	268	Rotterdam.....	76
St. Petersburg.....	236	Buenos Ayres.....	74
Milan.....	204	Melbourne.....	69
Rome.....	194	London.....	39
Venice.....	189		

In the New England States, the illegitimate birth-rate is quite low in comparison with that of most foreign countries having registration. For the 19 years ending with 1883, it was as follows in the four States mentioned:

ILLEGITIMATE BIRTHS PER 1,000 LIVING BIRTHS.

Massachusetts.....	14
Vermont.....	9
Connecticut.....	11
Rhode Island.....	8

The ratio in Massachusetts has been variable, as is shown by the following: For the decade ending with 1880, the average was 14.4 illegitimate per 1000 births; 1890, 19.4 per 1000 births.

For the past six years, however, there has been a decrease, the statistics being as follows:

ILLEGITIMATE BIRTH-RATE OF MASSACHUSETTS, 1887-92.

1887.....	21.8
1888.....	19.3
1889.....	18.3
1890.....	20.9
1891.....	17.1
1892.....	15.0

The above article was prepared for this encyclopedia by Dr. Samuel W. Abbott, of the State Board of Health of Massachusetts.

(Concerning the significance of a decreasing birth-rate, we abridge an article by J. L. Brownell in the *Annals of the American Academy of Political and Social Science*, July, 1894.) The fact of a decreasing birth-rate has been variously interpreted by various authors. The Malthusian theory is well known.

It affirms that population has the "constant tendency to increase beyond the means of subsistence,"* that "population, when unchecked, goes on doubling itself every 25 years, or increases in a geometrical ratio,"† and that, "considering the present state of the earth, the means of subsistence, under circumstances the most favorable to human industry, could not possibly be made to increase faster than in an arithmetical ratio;"‡ therefore "the increase of the human species can only be kept down to the level of the means of subsistence by the constant operation of the strong law of necessity, acting as a check upon the greater power,"‡ that is, the power of population. The possible checks upon this rapid increase of population are the preventive check, peculiar to man because of his superior reasoning powers and his will, and the positive check, to which plants and animals are also subject. The preventive check most strongly approved by Malthus is moral restraint, which he defines as "a restraint from marriage from prudential motives, with a conduct strictly moral during the period of this restraint,"§ or as "the restraint from marriage which is not followed by irregular gratifications."¶ He considers it "the least evil that can arise from the principle of population"¶¶ All other preventive checks clearly come under the head of vice.

The positive checks he divides into two classes: Misery, which includes "those which appear to arise not avoidably from the laws of nature,"** and vice, which includes "those which we obviously bring upon ourselves, such as wars, excesses, and many others which it would be in our power to avoid." "They are brought upon us by vice, and their consequences are misery."††

This view was much attacked even in Malthus' day, especially by Godwin‡‡ (q. v.). Nevertheless, it became almost universally adopted. The question, however, assumed a new form in the writings of Mr. Herbert Spencer. In an essay on the *Theory of Population Deduced from the General Law of Animal Fertility* published in the *Westminster Review* in 1852, he first stated his ideas on population, which were afterward more fully developed in his *Principles of Biology*. Mr. Spencer treats the Malthusian theory from a strictly biological and evolutionary point of view. He agrees with Malthus that population constantly tends to increase beyond the means of subsistence, but adds that this very fact is the cause of the progress of the human race. It stimulates man to greater effort, "causes a never-ceasing requirement for skill, intelligence, and

Malthusianism.

Herbert Spencer.

self-control; involves therefore a constant exercise of these and gradual growth of them.* "Excess of fertility, through the changes it is ever working in man's environment, is itself the cause of man's further evolution; and the obvious corollary here to be drawn is that man's further evolution so brought about, itself necessitates a decline in his fertility."† The latter clause is Mr. Spencer's peculiar contribution to the subject. He holds that throughout the vegetable and the animal world, and in the human race itself, "individuation and genesis are necessarily antagonistic,"‡ by individuation meaning "all processes by which individual life is completed and maintained," and by genesis "all processes aiding the formation and perfecting of new individuals." He therefore concludes that "the further progress of civilization which the never-ceasing pressure of population must produce will be accompanied by an enhanced cost of individuation,"§ and consequently by a diminishing birth-rate. In his speculative thought upon the future of the human race, Mr. Spencer sees that the highest product of evolution will be "a form in which the amount of life shall be the greatest possible, and the births and deaths the fewest possible."¶

A new development of the question has arisen with modern industrial discussions, led by Dr. George Hansen in Germany; M. Levasseur, M. Leroy-Beaulieu, and M. Dumont in France; Dr. George Blundell Longstaff, and Dr. J. Milner Fothergill in England; and Dr. John S. Billings, Dr. Cyrus M. Edson, and President E. B. Andrews in the United States.

Mr. Levasseur maintains that inequalities of production and consumption are primarily the causes of changes in the rate of the increase of population.

"The increase of a population is dependent upon the sum of its means of subsistence and the sum of its wants, and hence between the terms population, production, and consumption there exists an intimate relation. But it is not unchangeable. This is one reason why in every population there are both rich and poor, why peoples and individuals may enrich or impoverish themselves, and in consequence why the number of inhabitants of a country may increase rapidly or slowly, remain stationary or diminish."¶

Economic Considerations. M. Levasseur considers the conditions in France most favorable from an economic point of view. In his opinion it is very desirable that each generation should be born into a better condition than that of the preceding generation, and that the standard of life should be raised; this result, he says, will happen, as it has happened in France, where wealth increases faster than population and is widely diffused.** From a political point of view he considers the question very serious. On the whole, however, he approves of the present condition of population in France.

M. Dumont holds that wealth is not the cause of the diminishing birth-rate, but only the condition; that, tho on the surface the decrease of population is an economic question, at bottom it is intellectual, political, and esthetic; that as the desire to rise in the industrial, intellectual, political, or esthetic world increases, the birth-rate diminishes.††

M. Leroy-Beaulieu shows statistically that "a low birth-rate goes hand in hand with high wages and the spread of education," and that "it also appears to be particularly associated with democratic aspirations, and still more with a lessening of religious belief on the part of the people, and a modification of the old ideas of resignation and submission to their lot."‡‡

Dr. Hansen,§§ Dr. Longstaff,|| and Dr. Fothergill,¶¶ show especially the evil influences of city life upon the population, both in weakening the vitality and in diminishing the birth-rate. Dr. John S. Billings,*** Dr.

Cyrus M. Edson,* and President E. B. Andrews† have studied the question as it is presented in the United States. President Andrews, tho he refuses to adhere strictly to the classical Malthusian doctrine, accepts the main principle that subsistence is limited, and that therefore some checks are necessary to keep the population within the limits of subsistence. Dr. Billings and Dr. Edson discuss the diminishing birth-rate in the United States and its probable causes.

The generalizations tentatively reached by all these inquirers are that civilization in general checks the rate of increase of population, in spite of a diminishing death-rate; that city life is, on the whole, unfavorable to the natural increase of population, and that what the economists call the "raising of the standard of life" operates in the same way.

It has been assumed that the changes in the marriage-rate and the marriage age will account in a great measure for the decreasing birth-rate; but another explanation is more than hinted at in the following quotation from Dr. John S. Billings:

"It is probable that the most important factor in the change is the deliberate and voluntary avoidance or prevention of child-bearing on the part of a steadily increasing number of married people, who not only prefer to have few children, but who know how to obtain their wish."‡

Voluntary Prevention.

M. Levasseur and M. Dumont evidently hold the same opinion:

"By prevision we understand the human will restraining or directing the reproductive instinct, with a view to bringing children into the world only at such times and in such numbers that the father can hope to support them and to educate them for a position equal to his own. Prevision is the characteristic of the man who reflects, and who, conscious of his responsibilities, does not leave his destiny to chance. This virtue is the palladium of human liberty. The philosopher and the economist who believe in that liberty ought, if they are logical, to recommend such prevision, recognizing that if it is useful in the great mass of actions, it is nowhere more opportune than in the grave question of the growth of the family and the education of the child. . . . It is enough to lay down as a general rule that reason should control instinct."§ M. Dumont says: "The real cause of the decrease of our birth-rate is the wish to have few or no children, and that wish is determined by a combination of intellectual, moral, and esthetic tendencies peculiar to our people."¶

Dr. Cyrus M. Edson agrees with Dr. Billings that "the voluntary avoidance and prevention of child-bearing is steadily increasing," but thinks that the principal cause is the physical and nervous deterioration of the women of the United States; and this, he asserts, is largely due to the severe strain of modern life and education.¶¶ In fact, any one who is at all familiar with the statistical and medical literature of the subject is aware that the voluntary prevention of conception is the explanation of the diminishing birth-rate that is generally accepted by physicians and statisticians.

Such are the prevailing views to-day. Nevertheless, Miss Brownell, in the article referred to above, makes the point that

"1. Whether or not it be true that the means spoken of by Dr. Billings, M. Dumont, M. Levasseur, and Dr. Edson has become an important factor in the diminishing birth-rate of civilized countries, it is evident that it is not the only factor, and that, quite apart from voluntary prevention, there is a distinct problem to be investigated. This is shown by the fact that the white and the colored birth-rate vary together.

"2. Mr. Spencer's generalization that the birth-rate diminishes as the rate of individual evolution increases is confirmed by a comparison of the birth-rates with the death-rates from nervous diseases, and also with the density of population, the values of agricultural

and manufactured products, and the mortgage indebtedness.

"3. The Malthusian theory in general, that population tends to increase faster than the means of subsistence, is not true of the United States at the present time. In the regions where wealth increases most rapidly the population increases most slowly."

She supports these points by careful analysis and elaborate tables drawn from United States Census Reports. By a careful comparison of the birth-rates of the white and colored populations of the United States, she shows that the diminishing birth-rate appears in both classes,

and in the last decade even more among the colored than the white, and that therefore the cause cannot be mainly the voluntary prevention of conception, because this practice is notoriously the result of advanced civilizations, and much more prevalent among white than colored populations. Next she shows

by comparison of birth-rates and deaths from nervous diseases, (1) that the conditions that cause a high death-rate from nervous diseases lower the birth-rate, and *vice versa*, and (2) that since in two thirds of the 39 States and Territories in which the phenomena oppose each other, the birth-rate is above the average and

In one State (Delaware) the mortgage debt per capita is the same as for the United States.

* Coherence in the phenomena studied.

the death-rate from nervous diseases below the average, the variations above and below the average in the remaining one third must be proportionally greater; in other words, the conditions of life which cause such variations must be more intense. If civilization, as Mr. Spencer believes, be the cause of the lower birth-rate, we should expect a high civilization where the birth-rate is low. These conclusions are confirmed by the statistics.

She compares the birth-rates with conditions of industrial life, and shows that in 37 States and Territories the value of the manufactured products per capita coheres with the death-rate from nervous diseases and opposes the birth-rate, and in four States the three cohere; thus in 41 of the 47 States and Territories the value of the manufactured products per capita and the deaths from nervous diseases cohere.

In 35 States and Territories the value of the manufactured products per capita coheres with the density per square mile of area of settlement and is opposed to the birth-rate, and in three States the three cohere, making 38 States and Territories in which the value of the manufactured products per capita and the density of population cohere.

In 33 States and Territories the value of the manufactured products per capita coheres with both the density of population and the deaths from nervous diseases and opposes the birth-rate, while in two States the four cohere. Thus in 35 of the 47 States and Territories in the United States, the conditions of density, manufactured wealth, and deaths from nervous diseases are similar, and in 33 of these States and Territories they directly oppose the birth-rate.

The only conclusion to be drawn from such facts is that the conditions of advancing civilization are actually lowering the birth-rate, and that the conditions of a simpler agricultural life favor a high birth-rate.

If the average rates for the United States in 1880 and in 1890 be compared, the results obtained from the preceding detailed comparisons are confirmed. The birth-rate has diminished from 30.05 per 1000 of population to 26.68.* The value of agricultural products per acre of improved land has also decreased: in 1880 it was \$7.77; in 1890, \$6.88. The density per square mile of area of settlement has increased from 31.96 to 32.16, and the density per square mile of total land surface from 17.29 to 21.31. And finally, the value of manufactured products has risen from \$106.50 per capita to \$149.63.

See also DEATH-RATES and MALTHUSIANISM for various and contrary views.

BISMARCK AND SOCIAL REFORM, OTTO EDOUARD LEOPOLD, Prince, von, long time Chancellor of the German Empire, we consider here from the standpoint of his relation to social reform. He was born in 1815 at Brandenburg, of an old family, and studied at Göttingen, Berlin, and Griefswald. In 1847 he entered the Landtag and attracted notice as an ultra-royalist. He was opposed to the scheme for the reconstruction of the German Empire proposed in 1849, and strove for a united Germany under the lead of Prussia. He was appointed chief secretary of the Prussian legation at the resuscitated German Diet of 1851. He was sent later to Paris as Minister, and in 1862 was given the portfolio of Foreign Affairs and the presidency of the Cabinet. Unable to pass the reorganization bill and budget in October, 1862, he closed the Chambers, and for four years governed without getting the sanction of the deputies. The people were looking for a *coup d'état*; but the death of the King of Denmark opened up the Sleswick-Holstein question, and excited German national feeling, which Bismarck was able to use by the acquisition of the duchies to aggrandize Prussia. He negotiated the neutralization of Luxemburg

(1867), the humiliation of Austria, the reorganization of Germany under the lead of Prussia; he guided the Franco-Prussian War, dictated terms of peace to France, and was created Prince and Chancellor of the German Empire. He began a contest with the Catholic Church, expelling the Jesuits (1872). He presided at the Berlin Congress (1878). His later years have been busied with economic and social rather than diplomatic problems, and these we consider more at length. Since 1879 at least Bismarck has been considered almost the leading spirit of paternal State socialism. This, however, was not to adopt a new policy in Prussia, but simply to carry out, or, rather, revert to the traditional policy of the Hohenzollerns. (See GERMANY.) It was the proud boast of Frederick the Great that he was "*le roi des gueux*." Of all the governments of the seventeenth century, the Prussian was the first to seek the welfare of the whole community. The Prussian *landrecht* recognizes the State as the protector of the poorer classes, and one of its duties to supply sustenance and work for those lacking means and opportunity of earning a livelihood. It was upon these clauses that Bismarck relied when, on May 7, 1884, he declared to the Reichstag his recognition of the laborer's right to work. Bismarck himself once said: "The kings of Prussia have never been by preference kings of the rich. Frederick the Great said, when Crown Prince: '*Quand je serai roi, je serai un vrai roi des gueux*.'" He undertook to be the protector of the poor, and this principle has been followed by our later kings. At their throne suffering has always found a refuge and a hearing."

The principle of protection to which Bismarck reverted was the original and paternal policy of Prussia. Bismarck's paternal socialism, thus, is but a consistent following out of the principle of his masters. Yet how far he has carried these principles we shall soon see. They, however, must not at all be confounded with socialistic principles. (See SOCIALISM.) Socialism is democratic, fraternal. Bismarck's policy has been aristocratic, paternal. Few have persecuted the socialists as Bismarck has done, and few statesmen have been so hated by socialists as Bismarck has been. Their policies are radically opposite rather than identical. His drastic law against socialistic meetings and writings dates from 1878. Up to that time Bismarck had planned no measures of repression against socialists. But in that year two attempts on the life of the Emperor enabled Bismarck to carry through a drastic bill of repression which has been rigidly enforced until its failure to be renewed upon its recent expiration by limitation of time. Its main effect, however, has been to scatter the propaganda of German socialism abroad and to increase the real socialistic agitation in Germany. It shows, however, how little sympathy Bismarck has with true socialism. Of capitalism he is a far greater friend.

"I wish," he once told the Reichstag, "I wish we could immediately create a few hundred millionaires. They would expend their money in the country, and this expenditure would act fruitfully on labor all round. They could not eat their money themselves; they would have to spend the interest on it. Be glad, then,

* Billings, *The Diminishing Birth-rate in the United States* (*The Forum*, June, 1893).

when people become rich with us. The community at large, and not only the tax authority, is sure to benefit."

Bismarck's State socialism thus seems to have come from mixed motives—partly to take the ground from under the real socialists, partly, perhaps, from religious motives, mainly to serve and aggrandize the house with which he was so long identified. The religious flavor is not lacking.

On April 2, 1881, he said:

"I should like to see the State, which for the most part consists of Christians—alho you reject the name Christian State—penetrated to some extent by the principles of the religion it professes; especially as concerns the help one gives to his neighbor, and sympathy with the lot of old and suffering people."

So long ago as June 15, 1847, he declared to the Prussian United Diet, which was not accustomed to hear such words from an obscure provincial deputy:

"I am of opinion that the idea of the Christian State is as old as the *ci-devant* Holy Roman Empire, as old as all the European States, that it is the soil in which these States have taken root, and that a State, if it would have an assured permanence, if it would only justify its existence, when it is disputed, must stand on a religious foundation."

But his main thought was for Prussia.

He told the Reichstag on February 24, 1881:

"For me there has been but one compass, one polestar, after which I have steered: *Salus publica*. Since I entered public life I have often, perhaps, acted rashly and imprudently. But when I have had time for reflection I have always been guided by the question, What is most beneficial, most expedient, and proper for my dynasty, so long as I was only in Prussia, and nowadays for the German nation? I have never in my life been *doctrinaire*. All systems by which parties are divided and bound together are of secondary moment to me. My first thought is of the nation, its position abroad, its independence, our organization in such a way that we may breathe freely in the world."

We are now ready to understand his State-socialistic measures. As early as 1847 he spoke and voted in the United Diet for a State loan to a private railway enterprise, and from that time forward, whether as private deputy or minister, he never failed, when opportunity occurred, to promote the close connection of the State and the railways, always keeping in view the ultimate end of a thoroughly nationalized system of railway communication. While Germany was still disunited, his motto as Prussian Minister President was, "The railways for the State." When, however, the imperial throne was again raised, his motto became at once, "The railways for the Empire." He had no fear that German liberty and unity would "travel away with the first imperial locomotive."

A German writer has said of the nationalization of the railways in Prussia that it is a measure which "constitutes one of the most beautiful leaves in the Chancellor's wreath of fame." Certain it is that from the financial point of view, the policy inaugurated, or rather first seriously carried out, in 1876, has proved a great success, altho the plan has not yet been fully adopted by the Empire. But this is only one portion of Bismarck's socialism. When specifying in 1886 the articles which he regarded as most fitted to bear high taxation, Prince Bismarck included in the list tobacco and brandy. Of these two articles the Chancellor has endeavored to establish a State monopoly.

Prince Bismarck's attachment to State undertakings of this kind is primarily based on financial reasons. The monopoly appears to him the best means of raising revenue upon an article which can with justice be saddled with heavy taxation. At the same time he holds that the State is likely to be a better and more conscientious trader than the private undertaker, whose ends begin and end with gain. From the social standpoint, too, he predicts good results from the appearance of the State as an employer in spheres of industrial activity upon which a great number of people are dependent for their livelihood. When it was objected in the Reichstag in 1882 that his monopoly projects savored of socialism, he did not deny the imputation, but welcomed it, observing: "Many measures, which we have adopted to the great blessing of the country are socialistic, and the State will have to ac-

custom itself to a little more socialism yet. We must meet our needs in the domain of socialism by reformatory measures if we would display the wisdom shown in Prussia by the Stein-Hardenberg legislation respecting the emancipation of the peasantry. That was socialism, to take land from one person and give it to another—a much stronger form of socialism than a monopoly. But I am glad that this socialism was adopted, for we have as a consequence secured a free and very well-to-do peasantry, and I hope that we shall in time do something of the sort for the laboring classes."

Bismarck's return to the principles of protectionism, which movement he commenced in 1877, he also made largely for reasons of State socialism. His industrial legislation is, however, a far more direct illustration of this. The avowed object has been to protect the artisan class against the growing power of capital, as represented in the factory system.

Bismarck's extreme application of the principles of State socialism, however, has been in his schemes for State insurance. They are the result of organic development to be traced in the sickness insurance law of 1883, the accident insurance laws of 1884 and 1885, and the old age insurance law State Insurance. of 1887; all based on the principle of compulsion introduced in sick insurance legislation of 1854. Speaking of the first accident insurance bill of 1881, Bismarck said:

"The end I have in view is to relieve the parishes of a large part of their poor-law charges by the establishment of an institution, having State support and extending to the entire Empire, for the maintenance of old and incapacitated people, just like the institution of accident insurance."

He held that the State had positive and active functions to discharge, and that in Christian, monarchical, and paternally governed countries like the German States the principle of *Laissez-faire* was inadmissible. "I have a feeling," he said, "that the State can be responsible for its omissions," by which he meant its neglect to afford adequate help and protection to the weaker of its citizens. He not only demanded for the working classes insurance against sickness, accident, and old age, but he asked that the State would bear a fair share of the cost. Industry could not bear the whole burden, and it would be absurd to try to make the working man exclusively liable. So far as the present measure was concerned it was intended that the insurance premiums should be paid equally by employers, employed, and the Empire. In proposing a national system of insurance, he held that the State could not fairly entrust the insurance of workpeople to private adventure. "The corollary of compulsion is, in my opinion, insurance through the State—either through the Empire or the individual State; without that no compulsion. I should not have courage to exercise compulsion if I had nothing to offer in return. . . . If compulsion is enforced, it is necessary that the law provide at the same time an institution for insurance which shall be cheaper and securer than any other."

Bismarck's least success has been in the lines of taxation. He made a bold attack on the *laissez-faire* principle when he passed the Usury Law of 1880. This law was particularly intended to prevent the plundering of small land-owners and artisans by the predatory part of the money-lending community.

It is by no means, however, the case that Bismarck has been a consistent State socialist. He has refused, for example, to have anything to do with the principle of the payment of members. He refuses to be *doctrinaire*. He goes cautiously and experimentally. He said to the Reichstag, speaking of the insurance laws:

"The domain of legislation which we enter with this law . . . deals with a question which will not very soon

be removed from the order of the day. For 50 years we have been speaking of a social question. Since the passing of the socialist law I have continually been reminded by persons in high and official circles, as well as by others in the popular classes, that a promise was then given that something positive should also be done to remove the legitimate causes of socialism. I have had the reminder in mind *foto die* up to this very moment, and I do not believe that either our sons or grandsons will quite dispose of the social question which has been hovering before us for 50 years. No political question can be brought to a perfect mathematical conclusion, so that book balances can be drawn up; these questions rise up, have their day, and then disappear among other questions of history; that is the way of organic development."

This way Bismarck has steadily walked. His policy from first to last has been a protest against Individualism, against *Laissez-faire*. On this subject Prince Bismarck once expressed himself very forcibly in the Reichstag, when answering the criticisms of the Progressist leader, in words which sum up his whole policy.

"Herr Richter has called attention to the responsibility of the State for what it does. But it is my opinion that the State can also be responsible for what it does not do. I do not think that doctrines like those of '*Laissez-faire, laissez-aller*,' 'Pure Manchesterism in politics,' '*Jeder sehe, wie er's treibe, jeder sehe, wo er liege*,' 'He who is not strong enough to stand must be knocked down and trodden to the ground,' 'To him that hath shall be given, and from him that hath not shall be taken away even that which he hath'—that doctrines like these should be applied in the State, and especially in a monarchically, paternally governed State. On the other hand, I believe that those who profess horror at the intervention of the State for the protection of the weak lay themselves open to the suspicion that they are desirous of using their strength—be it that of capital, that of rhetoric, or whatever it be—for the benefit of a section, for the oppression of the rest, for the introduction of party domination, and that they will be chagrined as soon as this design is disturbed by any action of the Government."

On March 20, 1890, the emperor accepted Bismarck's resignation as chancellor, and General von Caprivi was appointed the same day in his place. This was due to a divergence of view between the young emperor, then just assuming the reins of power, and the old chancellor. Bismarck insisted on maintaining his

Resignation.

policy of stern repression of the socialists, while at the same time advocating State socialism, not going, however, so far as to interfere with wages. The young emperor, on the other hand, while following out the policy of State socialism, would not continue the socialist repression policy, and would interfere more with wages in a paternal way. Owing to these and other differences, Bismarck's resignation was practically forced and accepted. Since then Bismarck has been in semi-private life, tho' once elected to the Reichstag and accepting in order, from a national liberal policy, to vigorously criticise the Government. This not only in the Reichstag, but in private, and through various organs still faithful to him, he has not ceased most vigorously to do to the undisguised annoyance of the Government. On a recent journey to Vienna to attend the marriage of his son, Prince Herbert, he received an ovation along the whole line, and his influence to-day in Europe generally, as well as in Germany, is still very great, and always cast along the old lines of intense nationalism, paternal socialism, coupled with a stern and aristocratic repression of democratic tendencies. Recently his "reconciliation" with the emperor has caused universal comment, and his eightieth birthday (1895) was celebrated by all Germany. (See GERMANY and SOCIAL REFORM.)

Reference: *Bismarck and State Socialism*, by W. H. Dawson, to which book we are indebted for many quotations in our article.

BLACK, JAMES, the first candidate of the Prohibition Party for President of the United States. He was born in Lewisburg, Pa., September 23, 1823, and died December 16, 1893. Removing with his parents to Lancaster, Pa., in 1836, he worked in a sawmill and earned enough to engage a private teacher to give him instruction during the winter. In 1841 he entered the Lewisburg Academy. In 1844 he began the study of the law, and in 1846 was admitted to practice at the bar in Lancaster, where he resided all his life. In 1840 he joined the Washingtonians, the first temperance organization in his neighborhood. In 1846 he helped to institute a division of the Sons of Temperance. Prominent in the "Maine law" prohibitory movement of 1852 in Pennsylvania, Mr. Black was that year elected Chairman of the Lancaster County Prohibition Committee. It was largely due to Mr. Black's personal efforts that the Maine law movement became popular in Lancaster County and resulted, in 1855, in the election of two of the five temperance legislative candidates. Besides making speeches and writing for the cause, Mr. Black sometimes contributed as much as \$500 yearly to it.

The anti-slavery agitation about this time, and the Civil War a little later, interrupted the temperance work and engaged the attention and interest of Mr. Black. He aided in organizing the Republican Party in Pennsylvania, and was a delegate to the first national convention of that party in 1856. He was a Republican in politics until the formation at Chicago, in September, 1869, of the National Prohibition Party. He was chosen permanent president of this body. At the new party's Columbus (O.) Convention, in February, 1872, Mr. Black was nominated as its candidate for President of the United States, and in the election that followed he received 5608 votes. For the four years from 1876-80 he was Chairman of the National Committee of the Prohibition Party.

He was also a most active temperance worker outside strict party lines. He was one of the founders of the National Temperance Society and Publication House. Having identified himself with the Good Templars in 1858, two years later Mr. Black was elected Grand Worthy Chief Templar of Pennsylvania. Mr. Black's "Cider Tract" caused the Good Templars to declare against the use of cider as a beverage. Prominent as a layman in the Methodist Episcopal Church, he was one of the 26 who in 1869 organized the Ocean Grove Camp Meeting Association.

Mr. Black owned probably the largest collection of temperance literature contained in any private library in the world, about 1200 volumes being included in it. Among the works published by him are a pamphlet entitled *Is there a Necessity for a Prohibition Party?* (1875); *Brief History of Prohibition* (1880), and *History of the Prohibition Party* (1885).

BLACK DEATH, THE.—The pestilence, or series of pestilences, known by this name

took place in the middle of the fourteenth century, and was a partial, if not the chief cause, of vast economic changes in England. So far as can be ascertained, the disease first manifested itself in Central China in 1333, and thence spread in a westward direction toward Europe, where its force was first felt in the southern countries.

It appeared first in Italy, then crossed Western Europe, and arrived at the English ports of Bristol and Southampton in the summer of 1348. Whole districts were depopulated by its frightful ravages, and altho the old chroniclers give grossly exaggerated estimates of the number of deaths, it is probable that it carried off at least one third of the population. The scenes of horror and desolation which it caused beggar all attempts at description.

One immediate result of the plague was a great scarcity in the number of available laborers, because, while all classes had suffered heavily, the poorest had yielded most rapidly to the dire disease. This scarcity of labor meant, of course, higher wages for the laborer. In the case of agricultural workers this rise amounted to about 50 per cent., while in the case of skilled artisans, such as carpenters and masons, the same effect was felt, often more markedly. The nobles and landlords—the capitalist class of their day—objected, and, without waiting to call Parliament together, the king issued a proclamation ordering all men to abide by the rates which had been customary before the Black Death, and neither to demand nor pay higher wages. He also forbade laborers to leave the land to which they were attached, and assigned heavy penalties for so doing. But the king's parchment counted for no more, in the face of the needs of the country, than had Knut's imperious command to the sea, centuries before. Parliament met in 1349 and made haste to ratify this proclamation by reducing it to the form of a statute—the famous "statute of laborers;" but such legislative measures were hopeless against the demand for workers, and the very same men who passed these laws were themselves obliged to break them to prevent their land from remaining untilled. The peasants went freely into those districts where workers were most scarce, and found ready shelter and good wages. Complaints were constantly made to Parliament, and the "statute of laborers" was again and again enacted with added penalties, but to no purpose. For once the worker was able to meet the capitalist with the advantage on his side.

In spite of the great rise in the price of labor the price of the laborer's food did not rise in proportion. Food did not require much manual labor in its production, and hence the rate of wages was not much felt in its price. This will be the more noticeable when we remember that a fat ox could be bought with a sum equal to only six days' wages of an ordinary mechanic, tho it should be borne in mind that oxen were smaller then. What did rise was the price of all articles which required much labor in their production. Those who lost most by the change were the holders of large estates, who had to pay more for the labor which worked their land, and for the implements used upon it. On the

other hand, the peasant and artisan gained much higher wages, while the cost of living hardly increased at all. They had exchanged their former serfdom for the ability to earn not only the necessities of life, but many of its comforts also. And these changes were so far-reaching in their effects that the landlords were obliged to let their estates to tenants who worked them on their own account, paying rent to the lord; instead of, as formerly, compelling villeins to work them for the master's profit. Thus serfdom practically came to an end, tho the land-owners and lawyers did all that they could to prevent it, and succeeded in putting many obstacles in the path of the peasants. The gain was not all on one side, however, as the peasants began at this time to lose those rights in the "commons" and forests which until then they had enjoyed.

Another of the important effects of the Black Death was the spirit of independence which it helped to raise in the breasts of the peasants, who now began to feel their power. It is worth while to note that successful revolutions are seldom the work of starving men. Empty stomachs are not conducive to that clearness of vision which is needed to plan and carry out such movements. The years of prosperity following the plague of 1348 had done more to open the eyes of the working classes than all the centuries of poor rations that had gone before. The new spirit led to the preaching of John Ball (*q.v.*), the Peasants' Revolt (*q.v.*), and the Golden Age of "Merrie England." The revolt was put down, but the victory really lay with the vanquished; and from this time serfdom practically disappears from English history, and wages remain high till the robbery of the land by the landlords in the sixteenth century. For a study of the economic effects of the Black Death, see J. E. T. Rogers' *Work and Wages*, and for a contrary view see *Wealth and Progress*, by George Gunton.

BLACK LIST, a list published or prepared by any body of men of the names of those whom they consider faulty in any way. It is specifically used of official lists of insolvents and defaulters. It is used in industrial discussions of lists of employees who for one reason or another—perhaps because of having led in labor agitation—employers agree not to employ. It is also used of lists of firms which are believed to treat their employees unfairly, and therefore which the preparers of the black list believe should not be patronized by the friends of fair treatment. (See also **WHITE LIST**.) The blacklisting or asserted blacklisting by employers of their employees who have been active in the cause of labor has been a fruitful source of complaint on the part of labor organizations, and some States have passed bills forbidding blacklisting. (See **CONSPIRACY LAWS**.)

BLACKSTONE, Sir WILLIAM, was born in London in 1723, and died in the same city in 1780. A celebrated English jurist, he was appointed in 1758 Vinerian Professor of Common Law at Oxford, and in 1770 Justice of the Court of Common Pleas. His chief work, *Commentaries on the Laws of England*, appeared 1765-68.

Eight editions appeared during his lifetime and continually after his death.

BLACKWELL, ALICE STONE, born in Orange, N. J., in 1857, is the daughter of Lucy Stone (*q.v.*) and Henry B. Blackwell. She graduated from Boston University in 1881, and has been on the staff of the *Woman's Journal* (of Boston) ever since.

BLACKWELL, ELIZABETH, M.D., was the first woman who ever received a medical diploma. She was born in Bristol, England, in 1821. Her father emigrated to New York, and from there to Cincinnati in 1838, where he died, and left alone a widow and nine children. As the father had left but little money, something had to be done; and Miss Blackwell, who was notable for decision of character, at once opened a boarding-school. She was then only 18 years of age, but her school succeeded well. When the school was closed in 1844, Miss Blackwell, whose energetic spirit had long been restless under the limitations which society imposed upon women, determined to enter if possible the medical profession. For three years more she taught in another school, in order to obtain sufficient means for a medical course, and then she applied for admittance in the Philadelphia medical schools. She was everywhere refused. After a course of private lessons under medical professors, she finally obtained admission to the University of Geneva, N. Y. She remained here for two years, and graduated with the highest honors. Her propriety and discretion won for her the esteem of students and professors alike. After graduation she visited England and France, and studied for some time longer. In 1851 she returned to New York, and began the practice of medicine. At first other physicians refused to consult with her; but she overcame all obstacles and secured a large practice. In 1854, with her sister, Dr. Emily Blackwell (*q.v.*), she established the New York Infirmary for Women and Children. In 1869 she went to London, and there established the National Health Society, and aided in organizing the London School of Medicine for Women. In 1878 she settled in Hastings, England, and has worked and written on numerous social reforms, mainly on lines of social purity, municipal reform, and the health and education of women.

BLACKWELL, EMILY, was born in Bristol, England, in 1826, a sister to Elizabeth Blackwell (*q.v.*), and, like her, came with her father's family to the United States in 1832. She commenced studying medicine in 1848, but was refused admission in the medical colleges, and only allowed to attend lectures for a period in two others, till finally she was admitted to the medical college in Cleveland, O. Graduating triumphantly, she studied in hospitals and attended clinics in Edinburgh, Paris, and London. She returned to New York in 1854, and in connection with Dr. M. E. Zakrzewska (a Polish lady), she established a hospital which in 1865 was given college powers. A woman's college, it has been and still is a marked success. Dr. Blackwell is now one of the vice-presidents of and very active in the Society for the Promo-

tion of Social Purity. She is author of many tracts upon this and similar subjects. (See SOCIAL PURITY.)

BLAKE, Mrs. LILLIE DEVEREUX, was born in Raleigh, N. C., in 1835, of wealthy parentage. Her father dying in 1837, his widow removed to New Haven, and Miss Devereux was educated there by private tutors. In 1855 she married Frank G. Q. Umsted, a young lawyer, and resided in St. Louis and New York City, till she was left a widow with two children in 1859. She had already commenced writing stories, and had published a successful novel, *Southwold*. She now entered literature as a profession, residing in Stratford, Conn., New York City, and Washington. In 1866 she married Mr. Grenfill Blake, a young New York merchant, and made her home in that city. In 1869 she became interested in the woman's suffrage movement, and wrote and lectured continually. From 1879-90 she was President of the New York State Woman's Suffrage Association. She has been active in the agitation for police matrons (*q.v.*), for laws for seats for saleswomen, etc. Her lectures have been printed under the title of *Woman's Place To-day*.

BLANC, JEAN JOSEPH LOUIS (1811-82), was born in Madrid. In 1830 he went to Paris and became a clerk in an attorney's office. In 1832 he went to Arras to act as tutor, where he resided for two years, making some mark as a writer on literary and political affairs. Returning to Paris, he founded, in 1839, the *Revue du progrès politique, social et littéraire*. In this he brought out his work *L'Organisation du Travail*, which may fairly be called a French forerunner of Karl Marx's *Das Kapital*; tho in its form being an appeal rather than a theory, it makes no pretensions to scientific precision. In 1841 he published his *Histoire de dix ans*, which was an overwhelming indictment of the actions of Louis Philippe and his ministers during the years 1831-40. In 1847 he published the first two volumes of his *Histoire de la révolution française*. The revolution which broke out early in the next year compelled that to be set aside. His popularity among the Parisian workmen secured for him a seat in the Provisional Government then formed, where he brought forward the proposals for universal suffrage and the abolition of slavery. He was also appointed president of a Government commission for laborers. In March a procession of 200,000 workmen, headed by Blanqui, offered him the dictatorship, which he refused. The Provisional Government established the Ateliers nationaux (*q.v.*) which he had advocated, but they were started on such unsound principles that Louis Blanc opposed them and demanded their abolition. He even charged the government with plotting their failure. After four months' trial they were abolished, having proved a failure and a public nuisance. In June and again in August, 1848, he was accused in the Assembly of complicity in the Communist outbreak of May. Being condemned by a large majority, he fled to England, where he stayed in exile for more than 20 years, finishing his *Histoire de la révolution française* and writ-

ing his *Histoire de la révolution de 1848* and other works. In 1870 he returned to Paris and urged the citizens to prosecute the war to the uttermost. Till the time of his death he was elected deputy for Paris, always voting with the extreme Left.

BLAND SILVER BILL.—A United States statute of 1873 (20 stat., 25); so called from its author, Richard P. Bland, a member of the House from Missouri. It reestablished the silver dollar containing 412½ grs. troy of standard silver as a legal tender; but its special feature was a clause requiring the treasury to purchase every month not less than \$2,000,000 nor more than \$4,000,000 worth of silver bullion and to coin it into dollars. (See SILVER.)

BLANQUI, JÉRÔME ADOLPHE (1798–1854).—He is sometimes confused with his brother, L. A. Blanqui, the revolutionist, but followed quite a different course. From 1830 to his death he was the head of the École de Commerce of Paris, and in 1833 replaced J. B. Say as Professor of Political (and especially of Industrial) Economy at the Conservatoire des Arts et Métiers. He was elected in 1838 a member of the Académie des Sciences morales et politiques, and represented the department of the Gironde in the Chamber of Deputies. His teaching in political economy was liberal and progressive. By no means a socialist, he yet favored many socialistic principles. The brilliancy and vigor of his language is another characteristic which has aided him much. He was the author of several works. Of these the most important are: *Résumé de l'histoire du commerce et de l'industrie* (Paris, 1826, 18mo); *précis élémentaire d'économie politique* (Paris, 1826 and 1842, 32mo); *Histoire de l'économie politique en Europe, depuis les anciens jusqu'à nos jours, suivie d'une bibliographie raisonnée des principaux ouvrages d'économie politique* (Paris, 1838, 1842, and 1845). This last work has been translated into several languages. Tho not of the greatest merit, it has nevertheless done important pioneer work in a needed study.

BLANQUI, LOUIS AUGUSTE (1805–81), was born in Puget Théniers; came in 1824 to Paris and became a teacher and student of law and medicine. On the breaking out of an insurrection in 1827 he took his sword and joined the cause of the people, taking his part from this date in every Paris insurrection. He edited *Le Journal de la Société des Amis du Peuple*, and for this was imprisoned. Complicated in various conspiracies, he was imprisoned for two years, in 1836, but was pardoned in 1837. In 1839 he organized another insurrection, which was quickly put down, and Blanqui condemned to death—a verdict changed to imprisonment for life. Confined at Mont Saint Michel, and at Tours, he was freed by the February Revolution of 1848. By February 25 he was in Paris and organizing the Central Republican Committee. On May 15 he was captured and imprisoned 10 years at Belle Isle and in Corsica. Amnestied in 1859, he was, in 1861, accused of conspiracy and imprisoned four years. When the republic was proclaimed (September, 1870)

he went to Paris and advocated the principles of the extreme Left, publishing his *La Patrie en danger*. After the Commune he was arrested by Thiers, and (1872) condemned to deportation; but on account of ill health was held in Quélern and Clairvaux, and pardoned by Grévy, June 9, 1879. He was elected deputy in Bordeaux in 1879, but was declared ineligible. A mystic, a revolutionist, an autocrat, Blanqui was no mean thinker, and a convinced communist socialist. His main writings are *L'Eternité dans les astres* (1872); *L'Armée esclave et opprimée* (1880); *Critique sociale* (2 vols., appearing after his death, 1883).

BLATCHFORD, ROBERT P., was born at Maidstone, England, March 17, 1851, and apprenticed to a trade in Halifax, 1864, serving seven years. In 1871 he joined the army and served till 1877. Obtaining work as time-keeper and clerk at 30s. a week, he married in 1880. He began writing soon after, contributing to *The Yorkshireman* and *Toby*. In 1885 he removed to London to join the staff of *Bell's Life*, and wrote for the *Sunday Chronicle* at its start in August, 1885, under the nom de plume of "Nunquam." He soon declared himself a socialist, and has been writing on social questions ever since. In October, 1891, refusing to restrain his pen, he left the *Sunday Chronicle*, and soon after, on December 12, 1891, issued the first number of *The Clarion*, in whose pages his history has since been written. In 1891 he was named as parliamentary candidate for East Bradford, but soon withdrew, having no taste for politics. He originated the "Fourth Clause," about which so much agitation has been raised; and which practically laid the foundation of the I. L. P. It reads, at present, substantially as follows: "That all members of the I. L. P. pledge themselves to abstain from voting for any candidate for election to any representative body who is in any way a nominee of the Liberal, Liberal Unionist, Irish Nationalist, or Conservative parties." His latest volume, *Merrie England*, a series of letters on the labor problem to a working man, which first appeared in *The Clarion*, is now sold complete for a penny, and has reached a sale of well over a million copies.

BLIND, KARL, the German revolutionist, was born in Mannheim in 1826. Even while a student in Heidelberg and Bonn he began to organize revolutionary societies. In 1847 he underwent a short imprisonment for a tract, *German Hunger and German Princes*. In the revolutions of 1848 he played a prominent part at Carlsruhe and Frankfurt. He escaped to Alsace, but took part continually in revolutionary uprisings till he was compelled to flee both from Germany and France, since which he has resided in England, writing literary and political articles. His views are of national as opposed to international socialism and of socialism as opposed to anarchism. He strongly supported the movement for German unity in 1870.

BLIND ASYLUMS, OR "SCHOOLS FOR THE BLIND."—Bulletin No. 81 (Census of 1890) gives the following statistics for schools for the blind in the United States:

DECADES.	PUPILS.			EXPENDITURES.		
	Total.	Male.	Female.	Total.	Current.	Building.
Total	56,485	25,795	22,942	\$15,598,952	\$11,909,514	\$3,689,438
1840-50	3,444	1,103	921	\$610,747	\$514,134	\$96,613
1850-60	6,087	2,211	1,979	1,337,955	1,000,372	337,583
1860-70	9,117	3,316	3,224	2,600,687	1,911,794	688,893
1870-80	13,856	6,493	5,819	4,207,601	3,022,201	1,185,400
1880-90	23,981	12,672	10,999	6,620,265	5,339,316	1,280,949

The following institutions do not state sex in their reports for the decades indicated, which will account for the apparent discrepancies between the items and total of the above summary:

The Perkins Institution and Massachusetts School for the Blind: Total number of pu-

pils, 1840-50, 817; 1850-60, 1112; 1860-70, 1261.

Ohio Institution for the Blind, Columbus: Total number of pupils, 1840-50, 603; 1850-60, 785; 1860-70, 1316; 1870-80, 1544.

West Virginia School for the Deaf and Blind, Romney: Total number of pupils, 1880-90, 310.

SUMMARY OF STATISTICS OF SCHOOLS FOR THE YEARS 1880-89, INCLUSIVE.

YEARS.	PUPILS.			EXPENDITURES.		
	Total.	Male.	Female.	Total.	Current.	Building.
Total	23,981	12,672	10,999	\$6,620,265	\$5,339,316	\$1,280,949
1880.....	2,041	1,064	955	\$572,225	\$415,108	\$157,117
1881.....	2,096	1,097	974	560,183	481,197	78,986
1882.....	2,038	1,062	946	591,817	502,149	89,668
1883.....	2,230	1,159	1,039	611,894	520,864	91,030
1884.....	2,286	1,200	1,050	715,934	538,441	176,593
1885.....	2,397	1,266	1,099	743,232	563,078	180,154
1886.....	2,554	1,353	1,170	647,710	561,002	86,708
1887.....	2,638	1,415	1,190	679,632	587,636	91,996
1888.....	2,770	1,478	1,257	753,775	594,168	159,607
1889.....	2,931	1,578	1,319	744,763	575,673	169,090

The West Virginia School for the Deaf and Blind, at Romney, total number of pupils 310, does not state sex, which accounts for the apparent discrepancy between the items and total of the above summary.

The average annual cost and the average annual current expenditures per pupil in schools for the blind by decades from 1840-90 were as follows:

DECADES.	Average Annual Cost.	Average Annual Current Expenditures.
1840-50.....	\$268	\$226
1850-60.....	325	243
1860-70.....	388	285
1870-80.....	373	268
1880-90.....	288	232

The average annual cost and the average annual current expenditures per pupil in schools for the blind by years from 1880-89, inclusive, were as follows:

YEARS.	Average Cost.	Average Current Expenditures.
1880.....	\$321	\$233
1881.....	272	234
1882.....	297	252
1883.....	280	238
1884.....	319	240
1885.....	317	240
1886.....	260	225
1887.....	267	231
1888.....	283	223
1889.....	280	216

These averages are based only upon those institutions making complete returns.

The total number of pupils in schools for the blind in the United States in 1889 was 2931, while in 1880 the number was 2041, an increase in the decade of 890. It must be borne in mind that the apparent increase in the decade is due to some extent to the increased facilities for the reception and education of the blind in the schools established for this purpose.

BLISS, WILLIAM DWIGHT PORTER, was born in 1856 in Constantinople, Turkey; the son of Rev. E. E. Bliss, D.D., an American missionary. He studied in Robert College, Constantinople; Phillips Academy, Andover, Mass.; Amherst College, 1874-78; Hartford Theological Seminary, 1878-82. He was settled over the Fourth Congregational Church, Denver, Col., but on account of failing health, he soon returned to the East, and was settled at South Natick, Mass. He was married in London to Mary Pangalo, in 1884. In 1885 he became interested in socialism through seeing the workmen in factory villages and reading Henry George and the *Christian Union*. In 1886 he entered the Episcopal Church, and took charge of St. George's Church, Lee, Mass. Here he joined the Knights of Labor; was Master Workman of the Assembly at Lee, and in 1887 sent to Cincinnati as delegate from the Knights of Labor, being one of the secretaries of the Union Labor Convention. The same year he helped start with Father Huntington, in New York City, the Church Association for the Advancement of the Interests of Labor (Cail). In 1888 he took charge of Grace Church, South Boston. He was nominated for Lieutenant-Governor of Massachusetts by the Labor Party, but declined the nomination. He was one of the founders of the first Nationalist club in Boston in 1889, and soon after, with other clergymen, organized the Society of Christian Socialists. He also started the *Dawn*, and published it until 1896. Resigning his parish in South Boston in 1890 he formed the Mission and Brotherhood of the Carpenter, which has since grown into the Church of the Carpenter. In 1895 he commenced editing *The American Fabian*. He has done much lecturing for the Society of Christian Socialists, the Christian Social Union, and other organizations. He is the author of numerous tracts, mainly on Christian socialism. He is also editor of the (American) Social Science Library, author of the *Handbook of Socialism* (1895), and editor of this encyclopedia.

BLOCK, MAURICE, was born on February 18, 1816, at Berlin; in 1818 he went to Paris with his parents. Here his studies were pursued, with the exception of two years in Germany. Upon his return to Paris he was naturalized, and in 1843 entered the Bureau of Statistics, where he had charge of the Department of Labor. In 1862 he resigned in order to put to use the knowledge he had gained. He has received several scholastic honors, is a Fellow of the Superior Council of Statistics, and has been often intrusted with missions for scientific purposes. His *Le Progrès de la science économique depuis Adam Smith* (1890) Professor Seligman calls "a work which in some respects compares with the best production of recent times in any country." He is best known, however, by his *Traité théorique et pratique de statistique* (1886) and his various statistical writings for the French Government, and in his valuable *Annuaire de l'économie politique et de la statistique*.

BLOOMER, Mrs. AMELIA, was born in Homer, N. Y., in 1818, and in 1840 was married to D. C. Bloomer, of Seneca Falls, where she

resided till 1855. She commenced working for temperance and then for woman's suffrage. January, 1849, after the first woman's rights convention, she commenced the publication of the *Lily*, the first paper ever owned, edited, and controlled by a woman in the interests of women. In 1852 she called attention to the style of dress since called by her name, though she did not originate it. She wore it, however, for six years. In 1855 she sold out her paper and moved to Council Bluffs, Ia. In 1852 she commenced lecturing, and continued till ill health prevented, ending in her death in 1895.

BLUE RIBBON MOVEMENTS.—A distinguishing feature of many of the movements for the reformation of drinking men has been the bit of ribbon, generally blue or red, worn by the reformed men and others interested. The red ribbon was adopted by Dr. Henry A. Reynolds, September 10, 1874, as the badge of the Bangor (Me.) Reform Club, which he organized at that time, and which, consisting of reformed drinking men, was the first club of its kind ever formed. Throughout the remarkable pledge-signing campaigns that followed in Massachusetts, Connecticut, New Hampshire, Rhode Island, Michigan, Illinois, and other States, Dr. Reynolds made the red ribbon the sign of membership in the clubs he started, and they came to be known as Red Ribbon Reform Clubs. The white ribbon was adopted by Dr. Reynolds in connection with the red, the former to be worn by women and by young men under 18. The white ribbon is also worn by all ladies of the Woman's Christian Temperance Union. But the blue ribbon has been associated with temperance reform movements more extensively than any other badge. It was adopted by Francis Murphy, and has been donned by very many thousands in this country whom he has induced to sign the pledge.

The idea was borrowed in England. On February 10, 1878, a conference of temperance workers was held in London, and a total abstinence campaign was determined on. A central mission was to be established in London, with town organizations in the provinces as the work spread. The blue ribbon was chosen, and the "Blue Ribbon Army" was adopted as the name of the organization. Mr. William Noble, who took a prominent part in the inauguration of this work, had recently returned from a visit to the United States, where he had seen something of the methods employed in the Murphy and Reynolds movements. Pledge cards were issued and scattered throughout the British Empire, and during the years since they have been translated into several languages, and have found their way into various countries of Europe, into Africa and the Sandwich Islands. More than 1,000,000 pledges have been officially issued in addition to the pledges issued by independent workers cooperating with the movement. A change in the name from "Blue Ribbon Army" to "Blue Ribbon Gospel Temperance Movement" has been made, and several branch organizations, such as the "Help-Myself Society" among men and the "Help-One-Another Society" among women, have grown out of the original movement.

BLUNTSCHLI, JOHANN KASPAR, a German jurist, was born in Switzerland in 1808. He graduated at Bonn in 1829. He was professor in the University of Zurich, a member of the Grand Council of the local Government, and strongly opposed the civil war of 1847-48. In 1848 he became Professor of German and International Law at Munich, and in 1861 Professor of Political Science at Heidelberg. In 1864, with Baumgarten and others, he founded the Protestant Union, and subsequently presided over several Protestant conventions, and over the General Synod at Baden in 1867. He was in favor of a union between South and North Germany, and was elected to the Customs Parliament. Bluntschli is the author of many valuable works on politics, laws, and the sciences; his best-known book in this country being his *Theory of the State* (translated from the sixth German edition by R. Lodge).

BÖHM, von BAWERK, EUGEN, was born February 12, 1851, at Brünn, in Moravia. He entered the Austrian Ministry of Finance in 1872, where he remained until 1880. In the mean time he had received the degree of LL.D. from Vienna, and had improved his two years' leave of absence to prosecute his sociological studies at Heidelberg, Leipzig, and Jena, under Knies, Roscher, and Hildebrand. In 1880, immediately after his installation as *privat-docent* at Vienna, he was called to Innsbruck. In 1889 he accepted a councilor's seat in the Austrian Ministry of Finance. The best known of the important school of Austrian political economists, his main work is his *Kapital und Kapitalzins*, vol. i. (1884), a critical review of all theories of capital, translated into English by W. Smart (1890), under the title *Capital and Interest*, vol. ii. (1889), giving his positive theory of capital, and also translated by Smart as *The Positive Theory of Capital* (1891).

BOILEAU (or BOYLEAU), ÉTIENNE, was born about 1200. He joined the Crusades under Louis IX. (St. Louis), was captured, and ransomed by that monarch at a high price. At one time Provost of Orleans, he subsequently became (1258-70) Provost of Paris. Boileau, a man of noble birth and incorruptible character, suppressed venality, meted out justice, established the police of Paris, and hanged his godson for theft, and a friend for dishonesty. St. Louis, as a mark of confidence and approval, sometimes sat beside him at the Châtelet, where he administered justice. But the great work of Boileau was his compilation, about 1268, of the *Livre des Métiers*, a code of the regulations affecting the various industries of Paris. The exordium states the intention of the compiler to treat of (1) the trades of Paris, their ordinances and the breaches thereof, with the appropriate fines; (2) fees, tolls, taxes, and dues; (3) justice and jurisdictions in Paris and the neighborhood. The third part either was not written or has been lost. The *Registres* so formed constitute a highly valuable record of the condition of industrial society at the time—its trade privileges, masters, apprentices, their number, conduct, terms of service, holidays, quality of work and of goods, prices, middle-

men, fines, dues, etc. This compilation has been regarded as a landmark in the history of economics.

BOILER-MAKERS AND IRON SHIP-BUILDERS, UNITED SOCIETY OF (English). See TRADE UNIONS, section "England."

BOISSEL, FRANCOIS (1728-1807), was born at Joyeux, in Vivarais. Educated by the Jesuits, he became in 1753 parliamentary attorney in Paris, but soon removed to St. Domingo. A contest with the Government over his profession brought him back to Paris and kept him there 20 years. On the breaking out of the revolution he took an extreme Jacobin position. He is best known for his *Catéchisme du genre Humaine* (1789), in which appear many of the germs of later French socialistic thought. His first writing was *Discours contre les Servitude Publiques* (1786).

BOODLE was originally a vulgarism for money, and more particularly for booty; a phrase used in barrooms and at the street corners. Gradually some of the more vulgar and sensational newspapers began to make use of it in their articles dealing with the classes that were themselves in the habit of employing the term. Among these, the majority of the aldermen of New York City were numbered, and the bribes that these were supposed to be in the habit of receiving were referred to under that name. The charges of bribery were brought prominently forward by the investigation in 1886, by a committee of the Assembly, into the circumstances attending the grant by the aldermen in the previous year of a charter for a street railroad on Broadway in that city. Jacob Sharp, a man largely interested in New York street railroads, was popularly thought to have bribed the aldermen to grant the franchise. Much interest in the investigation was manifested by the public, and the terms "boodle" and "boodlers" were continually used by the newspapers. The general use into which the term was thus brought, added to the fact that it is a concise term, tended to purge it of its vulgar associations, and to give it standing in the vocabulary of the day. The term "boodler" is now universally applied to bribe-takers, more particularly to those connected with municipal governments, and most accurately to bribed aldermen. (See BROADWAY STEALS.)

BOOT AND SHOE INDUSTRY OF AMERICA, THE, employing some 200,000 men and women, with factories in all sections of the country, manufacturing annually millions of pairs of boots and shoes, for which more than \$200,000,000 are received, had its origin in an humble manner in what is now the city of Lynn, Mass., where, in 1634, Philip Kertland established a shoe-making shop. From his beginning gradually sprang, from time to time, more little shops, until 1750, when the first actual employing manufacturer appeared in the person of John Adam Dagry, a Welshman, who laid the foundation of the modern trade.

Dagry became known as the celebrated shoemaker of Essex, and was very successful, but eventually died a pauper. From this time the industry gradually developed and spread over Massachusetts, then entered New England, the Middle and Western States, Canada, and finally the Southern States. The manufacturers of Lynn, with few exceptions, have confined themselves to the making of women's sewed shoes, altho large numbers of men's and children's shoes have also been and are made there. The establishment of the industry in Haverhill made that the principal point for the manufacture of pegged shoes, mostly for women's wear; and Marblehead, of historic fame, devoted attention mainly to the making of children's shoes, while Brockton, Milford, Natick, and towns in Western Massachusetts made a speciality of men's boots and shoes. Marlboro entered largely into the manufacture of women's shoes. In 1812 boots and shoes were sent in wagon-loads from Lynn and Haverhill to New York and Philadelphia.

The shoe factory of that time, where the shoes were cut, was a modest affair, being small, not larger than an ordinary house of the present day. The uppers were distributed to the wives and daughters of shoemakers, to be stitched and bound, and were returned to the manufacturer, or, as he was commonly known, the "shoe boss." He then gave them out with the sole leather to the shoemakers, to be made in little shops, generally about 10 or 12 feet square; and oftentimes the kitchen or some part of the dwelling was utilized for the purpose. What is known as the factory of to-day really began in 1857, when the manufacturers began taking advantage of the invention of the sewing machine, and gradually drew the work of stitching, and sometimes the making, within the factory. Up to the time of the advent of machinery the shoe towns presented as a feature the little shoemakers' shops at every turn and on every hand. The introduction of machinery was followed by large factories, and the massing together of large numbers of men and women under one roof. Those little New England shoemakers' shops were really lyceums, and a wonderful aid in the educational development of the people. The daily newspaper was as much a necessity as the fire in winter, each workman in turn serving as reader, and the rest doing a portion of his work that he might not be the loser. Sometimes a contribution was made and a school-boy employed to read the paper. Every article was discussed *pro* and *con*; every workman kept himself thoroughly posted regarding public events, and questions philosophic, theoretical, and practical received earnest attention.

In 1859 a sole-sewing machine was introduced, and wrought a revolution in the trade. This was the invention of Blake, but was remodeled and improved by a Lawrence mechanic, Gordon McKay, and superseded all the then known appliances for joining the upper and sole together, and really made the factory system of to-day. Then in rapid succession followed machine after machine—skivers, buffers, edge trimmers, edge setters, channellers, beating-out machines, molders, heel polishers, pegging machines, sole cutters—and many more whose number is still on the increase. This divided and subdivided the work, until from a real shoemaker the workman has become only about the eightieth part of one. In the department of women's work the machinery as rapidly entered. From the Grover and Baker, the Singer, and many others, to the present time, the inventor has been on the alert, and the same degree of subdivision is apparent. The present factory system was well developed by 1870. Since the McKay machine, the most important machine introduced is the Goodyear welt machine, which is destined to become, if it is not already, as necessary as the McKay. This machine in its operation approaches more nearly than any other yet devised the hand-work formerly done in the little shops.

There are annually manufactured in the United States about 180,000,000 pairs of women's and children's shoes, and about 80,000,000 pairs of men's. The average wages appear to be about \$500 annually. The greatest distributing center is at Boston, Mass., more than half of all shoes made being handled at this point; and in one State alone—*viz.*, Massachusetts, over one third of all these boots and shoes are manufactured. New York, Philadelphia, Chicago, St. Louis, and Cincinnati, have become important as manufacturing and shoe-distributing points. Before the factory system was established, the New England farmer became in the winter a shoemaker, and from Lynn, Haverhill, Beverly, Marblehead, Natick, and other places obtained his shoes and stock. So largely was this practised, that regular express routes were established and maintained for this traffic alone. Organizations among

men and women working at the shoe trade have been many, and have generally resulted in marked improvement in their condition. The first organization was known as the Sons of St. Crispin, existing previous to the factory system, and did not appear as an important factor. The first really important and effective organization was the Knights of St. Crispin, and to every shoemaker the letters K. O. S. C. were familiar. In 1864 Newell Daniels conceived the plan, and with some fellow-workmen in Milford, Mass., drafted a rough or crude constitution. Daniels went West, locating at Milwaukee, Wis., and there, March 1, 1867, established the first lodge, with seven members, one of whom, F. W. Wallace, gave to the order its name, in honor of the patron saint of the shoemakers. The German Custom Shoemakers of Milwaukee became Lodge No. 2, after which Daniels started on a propagating tour, and lodges were established in various shoe towns of New York, Massachusetts, and other States. The Grand Lodge was organized at Rochester, N. Y., in 1868, with representatives from 60 lodges, and Martin Gavin as the first presiding officer. For five years thereafter the order was a power in the land, becoming the foremost trade organization in the world. It made and unmade politicians, it started cooperative stores, it maintained a monthly journal, it fought against threatened reductions of wages, and succeeded in generally establishing higher rates of wages. The order grew until it became international in its character, by extending mainly to Canada, until 400 lodges and over 40,000 members were borne on its rolls. But discord arose and a rapid decay set in in 1874, tho an attempt, attended with partial success, was made in 1875 to revive the order. In 1877 it really did assume such shape and size as to successfully battle with and defeat the Lynn manufacturers; but again by 1878 the order was extinct, dying because it had undertaken a work beyond its strength. Then followed regularly annual reductions in wages until organization again appeared. In December, 1860, 16 Lynn lasters (those working at that part of the trade known as lasting the shoes) organized the Lasters' Protective Union; they being then among the poorest paid of any in the business felt in a greater degree the need of union. The organization spread until to-day they claim about 80 unions and about 15,000 members. The Lynn union leased a hall, opened an office, and made its secretary its representative in all matters between themselves and their employers, in reality, the walking delegate. At the formation of a general organization the general secretary, Edward L. Daily, was made the representative in all cases.

The improvement in the condition of the lasters from the inception of their organization till its present time has been marked.

The Knights of Labor were introduced into Massachusetts by a shoemaker, Charles H. Litchman, in 1878. The shoe craft of Philadelphia had already turned their attention to this organization, and their Eastern brethren gradually followed until the trade generally united in organization, but this time in conjunction with other occupations. The shoemakers remained with the Knights of Labor until 1888, when all but a remnant withdrew and formed the Boot and Shoe Workers' International Union, with Henry J. Skeffington as secretary. This year (1895) these various organizations have voted to enter into a small organization, the Boot and Shoe Workers' National Union.

The various organizations of the shoe trade have many times locked horns with the manufacturers, and while sometimes defeated, have generally succeeded. The briefest mention of a few important occasions of this sort may suffice. Probably when all things are considered, the greatest strike in the trade was in 1860, beginning in Lynn. The panic of 1857 brought wages to a low ebb, and there was much suffering and discontent; and in consequence of the efforts of Alonzo G. Draper, afterward a brigadier-general in the Union army, a strike took place February 14, 1860, with 5000 people parading the streets. For seven weeks parades were frequent, the city organizing by wards, the women operatives to the number of 2000 parading with the men. The shoemakers were then known as cordwainers, and during the strike they formed the Journeymen Cordwainers' Association. In anticipation of trouble, Colonel Coffin, commanding the Eighth Regiment M. V. M., ordered Company F, known as the Lynn City Guards, to report for duty. They did so, but nearly all being themselves shoemakers, officers and men volunteered their services to the strikers for escort duty, and being accepted, were thereafter a feature of the parades. The strike spread to Marblehead, Beverly,

Labor Organizations.

Natick, Marlboro, Milford, and other places, and was finally settled by a compromise. During the strike trips were made by the men and women to the different places where the strike prevailed, sometimes marching the whole distance, and indulging in a grand parade in the town visited. At other times clam-bakes, candy-pulls, and the amusement of escorting new converts to the factory to give up their job and go on strike engaged attention. The women were as zealous as the men, persuading weak sisters to join them and keeping their ranks firm. In Philadelphia in 1880, and again in 1886, a protracted struggle ensued; and New York and Brooklyn in 1886, Cincinnati in 1887, Brockton, Mass., 1885, Marblehead, 1883, Haverhill, 1885, and Worcester County, in 1887, may be added to the important list. These organizations have been instrumental in having boards of arbitration (*q. v.*) established in several places. These boards have proved only temporary, and yet have accomplished something, the most notable instance being the joint board of arbitration in Philadelphia, acting under rules which became known in the shoe trade as the famous Philadelphia rules. In Lynn and Beverly a municipal board served to form a channel for arbitration; in Brockton it was called a joint council; and in Haverhill a joint board of arbitration. They are to-day largely replaced by the State Board.

In spite of the factory system the workers in the shoe trade have maintained a high degree of intelligence, and have been able to keep the day's work down to ten hours, with a prospect of shorter time; and the rule is to pay wages every week. All reform movements receive strong support in shoe towns.

A. A. CARLTON.

BOOT AND SHOE OPERATIVES, NATIONAL UNION OF (English). See TRADE UNIONS, section "England."

BOOTH, CHARLES, born in 1841; head of a large shipping and mercantile firm of London, Liverpool, and New York, undertook in 1883 a detailed analysis of the census from 1841-81 with a view of determining the shifting of population from one occupation to another. (See Statistical Society's Journal.) In 1885 he began elaborate inquiry into the social condition of London, the results of which are embodied in *Life and Labor of the People* (Macmillan), of which four volumes are published. In 1892 he published the results of his inquiry into English poor law statistics, and recommended proposals for universal old age pensions from public funds (*A Picture of Pauperism*, Macmillan). He was President of the Royal Statistical Society of London (1892-94), and is a member of the Royal Commission on Aged Paupers (1893). He married Mary, niece of Lord Macaulay.

The following summary of the results of Mr. Booth's investigations appeared in an article by James Mavor, in the *Annals of the American Academy* for July, 1893. He says:

"By far the most important, in point of positive results of the applications of modern scientific methods of research to the study of society, and especially to the problems of poverty, is the work of Mr. Charles Booth upon London. Mr. Booth has carried on his investigation, independently of the Le Play method, and on different, tho somewhat similar, but less systematic, lines. He has conceived the idea of making an exhaustive study of the population of London, from an economic point of view. With this object he has already, by the aid of an army of assistants, thoroughly explored a great part of London. He has made a careful investigation of a vast number of families, and has gleaned not all, but a large number of the relevant facts about them. He has classified these facts and drawn certain provisional conclusions from them. His work is indeed, in most ways, a perfect model of what such an investigation should be. The conditions of each great city are so different from those of every other that not until we have before us similar investigations of other cities shall we be entitled to form definite conclusions about the poverty in them.

"Early in Mr. Booth's investigations he found it necessary to devise a classification which might serve as a standard for the measurement of different degrees of poverty.

"The standard is as follows:

"A. The lowest class of occasional laborers, loafers, and semi-criminals.

"B. Casual earnings—very poor.

"C. Intermittent earnings, } Together, the 'poor.'

"D. Small, irregular earnings, }

"E. Regular standard earnings—above the line of poverty.

"F. Higher class labor.

"G. Lower middle class.

"H. Upper middle class.

"These divisions are of necessity arbitrary. In different places, or at different periods in the same place, they would be denoted by different pecuniary amounts. Each division is, however, sufficiently permanent in its central idea for practical purposes. In London, in 1886-89, when these investigations were made, the 'poor' classes C and D comprised those who have an income of from \$4.75 to \$5.10 (18s. to 21s.) per week for a moderate family; Class B comprises those who fall below this amount.* The 'poor' may be described as living in a state of struggle to obtain the necessities of life, while the *very poor* live in a state of chronic want.

"Here, then, we have a gauge by which to measure the standard of comfort of the people. The gauge is readily adjustable to any locality. What we need to do is by a general inquiry to fix the amount of the money wages applicable to each class with the relative numbers in family, and then proceed to discover by minute inquiry what the standard of comfort is in each family over the different quarters of a city. This inquiry involves a vast amount of time and trouble, and must be repeated at moderate intervals; but without such an inquiry our knowledge of the people, of their standard of comfort, of what constitutes poverty, and the extent of it is quite vague and indefinite.

"The results of Mr. Booth's investigations into the economic condition of a certain portion of the people of London reveal many interesting points. In the district chosen by him for investigation in the first instance, East London and Hackney, comprising an area of about seven square miles in the east of London, bounded on the south by the river Thames, on the west by the city, and on the east by the Poplar marshes, there are about 900,000 inhabitants. Of these, 64.8 per cent. were above the line of poverty and 35.2 per cent. were below it. Of this 35.2 per cent., or 315,000 persons below the line of poverty, only 6000 were inmates of institutions; so that over 300,000 persons were living in poverty in this area—one third of the population.

"But of these 300,000 persons living in poverty, 128,000, or nearly one half, were earning regular low wages; 74,000, or about one fourth, were making irregular earnings; 100,000, or one third, were making casual earnings; while 11,000, or 4 per cent. of the poor, or 1¼ per cent. of the whole population of the district, belonged to the lowest class of occasional laborers, loafers, and semi-criminals.

"Here, then, it is clear that in studying the problems of poverty, we have to deal not alone with those who claim public relief as paupers, or who claim private charity as beggars, but with the great army from which these classes are constantly recruited, the army of those who live at or under the line of poverty—a great army living at a depressed rate of life, and tending to reduce the vitality of the whole population.

"But Mr. Booth has done something more than merely discover the extent of poverty. He has made inquiry into its causes. The causes

of poverty turn out not only to be numerous, but interactive. There is the principal cause and the contributing cause; there is the cause and the effect visible in the same person, or in two or more persons. Thus the poverty of a child may not be due to any fault on the part of the child, but to one or the other parent, or both.

"This strictly empirical investigation of Mr. Booth's reveals the following causes of poverty operating as principal or contributory causes:

"Crime, vice, drink, laziness, pauper associations, heredity, mental disease, temper, incapacity, early marriage, large family, extravagance, lack of work (unemployed), trade misfortune, restlessness (roving, tramp), no relations, death of husband, desertion

Causes of Poverty.

* C. Booth, *Life and Labor in East London*, vol. i., p. 33.

(abandoned), death of father or mother, sickness, accident, ill luck, old age.

"It is difficult to give a fair idea of Mr. Booth's investigations from his voluminous tables. But, out of 1000 paupers in Stepney whose cases were carefully investigated individually, it was found that old age was the chief principal and contributory cause.

"Old age was the principal cause in 32.8 per cent. of the cases.

Sickness.....	26.7	per cent.
Drink.....	12.6	"
Accident.....	4.7	"
Trade misfortune.....	4.4	"
Pauper associations and heredity.....	1.1	"

As contributory causes:

Old age contributed of the cases..	17	"
Pauper associations and heredity contributed chiefly with sickness, drink, and old age as principal causes of the cases.....	17	"
Drink contributory cause, with sickness and old age as principal causes, accounted for the pauperism of.....	12	"

While sickness accounted for an equal number.

"Altogether drink is returned as responsible directly as principal, or indirectly as contributory, cause for 25 per cent. of the cases. Mr. Booth, however, says 'the proportion is less than might have been expected, and it is probable that closer research into the circumstances and history of these people, if it could be made, might disclose a greater connection than here appears between pauperism and the public house. It is, however, noteworthy that the results shown agree on the whole with those of the two inquiries I have myself previously made into *apparent* causes of poverty. The first, regarding 4000 cases of poverty known by certain of the School Board visitors, gave 13 to 14 per cent. as one to drink, the lighter percentage being for the greater degree of poverty. The second, regarding about 5000 people living poor and irregular lives, showed 10 and 11 per cent., dropping to only 5 per cent. for about another 3000, who, tho poor, were more regularly employed.'

"In St. Pancras Workhouse the number of cases in which pauperism was due to *old age* as a principal cause was 23.4 per cent.

To sickness.....	20.7	per cent.
To drink.....	21.9	"
To laziness.....	10.6	"
To mental derangement.....	4.3	"

"In St. Pancras Workhouse about the same number of cases were investigated, but they included a smaller number of permanent paupers than the Stepney house, whose figures were first quoted. The current cases exhibit the largest amount of drunkenness. The 'ins and outs,' or those who go to the workhouse for a while and then leave, are specially notable for drunken habits. Forty-three per cent. of the 'ins and outs' were obliged to seek refuge in the workhouse on account of drink.

"The details of Mr. Booth's conclusions are to be found in his smaller volume on Pauperism. His main conclusion is that *old age* is the most frequent principal cause of pauperism, and he suggests as a remedy for this cause a national scheme of endowment of old age. Old age, then, stands first, sickness next, and then comes drink."

BOOTH, WILLIAM, founder of the Salvation Army, was born in Nottingham, 1829, and became a minister of the Methodist New Connection in 1850. He resigned his connection with the Methodist Conference in 1861, and after living for some time in the East End of London, started, in 1865, the "Christian Mission," which was the foundation of his present organization. The movement, which was even then of a semi-military character, did not make very much impression until 1878, when he named it the "Salvation Army." Since that time it has grown uninterruptedly and phenomenally in all quarters of the globe. His skill as an organizer is best shown by the strict military discipline which he

is able to maintain throughout the whole of the organization. In 1890 he published a book called *Darkest England*, which contained a scheme by which he proposed to grapple with the destitution that is eating the life out of England. This has led to a very important work, for which see SALVATION ARMY SOCIAL SCHEME. General Booth has been accused of using the large sums given him for this scheme to further private ends, but an investigating commission has completely vindicated him. (See SALVATION ARMY.)

BOUCICAUD, JACQUES ARISTIDE, AND THE BON MARCHÉ.—The Magasin du Bon Marché, Rue du Bac, and adjoining streets, Paris, is a huge establishment for the sale of all kinds of manufactured goods, which employs some 3000 persons, superior officials, clerks, salesmen, and saleswomen, and attendants of various grades. The founder and builder of this vast undertaking was M. Jacques Aristide Boucicaud.

M. Jacques Aristide Boucicaud was born in 1809 at Bellême (Orne). The son of a hatter in a small way of business, he had to begin early his apprenticeship to a laborious life.

Before long he came to Paris and entered as employee the Magasins du Petit Saint Thomas, where he rapidly distinguished himself, and became superintendent and purchaser. It was in 1852 that he acquired the establishment, then a very modest one, called the "Bon Marché," to the development of which he applied all the powers of his high intelligence, prodigious activity, accurate taste, and commanding capacity of directing a vast organization and at the same time keeping a firm grasp on the smallest and seemingly most insignificant details.

From the day when he felt himself justified in counting on a durable success, he determined to put his philanthropic ideas into practice. He had set out from the lowest rung, he had painfully climbed all the successive steps of his business, he had seen other employees suffer, and suffered himself, from abuses inherent in the current modes of doing business; his desire was that the experience he had so laboriously gained should not be lost, but should one day prove of service to all engaged in his branch of trade.

M. Boucicaud's material success was extremely great. His establishment, when he acquired it in 1852, was doing a business of not more than £18,000 a year; in 1869 the annual turn-over was £840,000—an increase of 4500 per cent. in 17 years.

July 31, 1876, witnessed the introduction—which had been delayed by the disastrous events brought upon Paris in the train of the Franco-German War—of a long-meditated system of profit-sharing by which a direct interest in the prosperity of the Maison Boucicaud was thrown open to a large and constantly increasing number of its employees. A provident society was formed for their benefit, to be supported exclusively by sums annually paid over for that purpose out of the net profits of the house.

A few details, extracted from the printed regulations of the Provident Society, will show what were to be the qualification for membership and the terms of participation.

Every employee who had worked continuously for five years in the house had a right to membership—unless he happened to belong to the small class of superior officials who already possessed a direct interest in the sales effected in their several departments, or in the general business of the house. This arrangement obviously provided for a steady annual increase in the number of employees to whom the benefits of participation were to be extended.

Except in the opening year, for which a special arrangement was made, the sum annually paid over to the society out of the profits of the house was to be allotted in the following manner:

A separate account, opened in the name of each participant, was to be yearly credited with a share of this sum proportional to the amount which the employee in question had received in wages during the year on which the division was made.

Each such account was to be further credited in every successive year with interest at 4 per cent. on the whole amount standing in it. An annuity accumulating at compound interest for a term of years was thus assigned to each beneficiary.

The conditions under which the capital sums accumulated in this manner were to come into the actual disposal of the benefited persons were as follows:

A male employee, either on attaining the age of 60 or on completing 20 years of uninterrupted work for the house, could claim cash payment of the entire sum standing to his credit. In the case of women the qualifying periods were to be 50 years of age or 15 years of work.

While a long deferred participation was thus created as the ordinary rule, exceptional cases were to be promptly provided for. On the death of a member of the society, of whatever age or standing, immediate full payment to surviving relatives was statutorily directed.

In the event of disabling illness recourse could be had, subject to approval by the heads of the firm, to partial or entire liquidation of account.

Such was M. Boucicaut's plan for securing to his employees an accumulated capital. The scale on which it was to be carried into effect, the actual amount to be in each or any year paid out of profits to the Provident Society, he reserved absolutely for his own unrestricted decision.

Unfortunately it was on but two occasions, in 1876 and 1877, that he was permitted to exercise this power. He died December 26, in the latter year, and 10 months afterward death removed his son also. His widow succeeded alike to the ownership and direction of the house and to the maintenance of its organization and traditions.

The property of the society amounted August 1, 1883, to £26,453.

In January, 1880, the proprietress of the Bon Marché, as an act of respect to the memory of her husband, carried his ideas a step farther by formally admitting into partnership with herself 96 heads of department and other employees, who put sums not less than £2000 each, and not more than £4000 each, into the business. In some instances these sums, tho standing in a single name, were contributed by a group of employees, so that the benefits of partnership were actually extended to a larger number of persons than those named in the articles of association.

The Bon Marché, since the death of Madame Boucicaut, has been a partnership *en commandite* by shares, directed by three managers. In 1887, when one of the medals of the Audeoud prize was awarded to this establishment, the number of the shareholders—almost all employed in the house—was 373; 239 employees had an interest by participation in the profits of the whole house or those of their own department. The other 240 employees had an interest in the business which they transacted personally.

BOUNTIES.—A *bounty* is a term in social science usually applied to a premium given by a government to promote some branch of production or industry which it desires to encourage or aid. It is, however, also used for payments of money to induce men to enlist in the army and navy. In Great Britain the giving of bounties of this latter kind has been common. In the United States it has been adopted to a less extent, but in the War of the Rebellion some recruits of the Union Army received as much as \$500 or more. Some, however, enlist-

ed, received the bounty, and soon after deserted, receiving the merited name of *bounty-jumpers*.

The giving of bounties to encourage some industry has been practised at times by almost all nations. England, which has now in the main rejected the bounty system, formerly gave bounties for many industries, notably to encourage the herring fisheries, the Irish linen trade, and the exportation of grain. After the founding of the Royal Academy (1769), a bounty was given on the exportation of engravings. For many years, however, under the influence of free-trade ideas, the English Government has given up the bounty system in the main, tho still granting subsidies to steamship companies. (See **SUBSIDIES**.) France, Germany, and all the greater continental powers have held on to the bounty system much longer, especially as regards bounties upon sugar. In the United States bounties have been given for tree planting and sugar, with subsidies and land grants to railways and steamship companies. (See **SUBSIDIES**.) Congress in 1890, for example, voted a bounty of two cents per pound for 15 years on the production of domestic sugar. This was, however, ended by the tariff of 1894, altho an appropriation of \$5,233,289 was later voted to continue the operation of the bounty on sugar raised before June 30, 1895.

Almost all political economists have condemned bounties in general, altho many have approved of them under particular circumstances. Adam Smith vigorously and Ricardo still more sweepingly condemned bounties, on the ground mainly that they diverted capital perniciously; and their position has been generally followed by free traders and been criticized by protectionists. Bounties, however, have sometimes been preferred to a protective tariff by free traders, on the ground that their working is open and direct, not covert, like a tariff. They have been denounced, on the other hand, by some protectionists, as more artificial than a tariff. A tariff, it is argued, makes the foreign exporter pay; a bounty taxes the general citizen for the good of one class. (See **FREE TRADE**; **PROTECTION**; **SUBSIDIES**.)

BOURGEOISIE.—A French term, originally used for the free citizen class in the towns, as distinguished from the aristocracy, on the one hand, and the working class, on the other. Burgess and burgher have about the same meaning, and in a general sense mean inhabitant of a burgh or town. When used technically, however, it often means a person who holds some privilege in a town or municipal corporation. The French socialists have, however, widened the meaning of the term bourgeoisie, making it express all the more or less wealthy middle class as opposed to the proletariat and working class, and this use has passed into all socialist literature. There has also often been associated with the term an implication of a narrow-minded, selfish, money-seeking spirit, always blindly supporting the interests of capital, as opposed to those of labor. (See **PROLETARIAT**; **ESTATES**.)

BOURSE.—A French word for (1) the meetings of bankers and merchants for the transac-

tion of business ; (2) the place where such meetings are held. (See STOCK EXCHANGE.)

BOWEN, FRANCIS, born in 1811, died in 1890 ; Professor of Philosophy in Harvard University from 1853-89. He wrote on economic topics, history, politics, the classics, and most of all on philosophy. He was editor of the *North American Review* from 1843-54. His economic writings in the main are in the nature of textbooks, stating and illustrating the doctrines of the classic economists ; but on the subject of international trade he reasoned in favor of the doctrine of protection. His larger writings on economics were *Principles of Political Economy* (Boston, 1856) ; *American Political Economy* (New York, 1870).

BOYCOTTING.—A boycott is a combination against a landlord, tradesman, employer, or other person, to cease social or business relations with him, and to induce others to withhold having relations with him. It is also used of agreements not to use certain articles or the articles of a certain manufacturer, on the ground that they have been produced in ways or under conditions condemned by the parties dictating the boycott. The word is derived from the name of Captain Boycott (the name is sometimes written Boycatt), who was, in 1880, living at Lough Mask House, County Mayo, Ireland, as land agent to Lord Erne, an Irish nobleman. The population of the region for miles around resolved to have nothing to do with him, and as far as possible to prevent any one else from having anything to do with him. His life appeared to be in danger—he had to claim police protection. . . . To prevent civil war the authorities had to send a force of soldiers, and Captain Boycott's harvests were brought in guarded always by the little army. This proceeding was the origin of the word, and its origin has undoubtedly contributed to the prejudice which the court feels toward acts called by this name. The idea of the courts has uniformly been that the word implied lawless violence, or what directly led to it. At all events, in most of the cases decided against boycotting in this country by way of injunction to restrain it, or by indictment to punish it, there has been present a distinct element of violence. This is true in *People v. Wilzig*, 4 N. Y. Cr. Rep., 403 (1886) ; in *People v. Holdorf*, in *People v. Kostka* (same volume), and numerous other cases. Undoubtedly the decisions have gone farther. They pronounce a boycott an unwarrantable attempt to interfere with an employer's business, and as he must frequently submit to it or be ruined, as practically coercion. The avowed purpose being to ruin a man's business, it makes no difference, according to the courts, whether force be used or not.

In England the law against boycotting and combinations is more carefully guarded than in this country. Says Mr. C. A. Reed, writing in the *Annals of the American Academy* for July, 1894 :

"A passage of the Conspiracy and Protection of Property Act (38 and 39 of Vict., 1875) reads: 'An agreement or combination by two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute between employers and workmen, shall not be indictable as a conspiracy, if

such act committed by one person would not be punishable as a crime.' This puts an end to conspiracies to accomplish something relative to trade disputes which one person might without criminality do alone. Intimidation is forbidden under a severe penalty, and what is intimidation is very fully defined. It includes violence to the other, his wife, children, or injury to his property ; persistently following such person about ; hiding his tools or clothes ; and watching and besetting the house where he is. The advanced character of the English law on this subject as compared with our own is shown by two very recent cases, *Gibson v. Lawson* and *Curran v. Treleaven*. In the first the employees at an iron works notified their employer that if a certain fellow-workman did not join their union they should quit. The fellow-workman was notified by the superintendent of the employer, but declined to join the men's union, and he was dismissed to avoid a strike. The men were indicted, but the court held that their conduct was allowable under the recent act. The second case is still stronger. Here an employer was notified by members of a trade-union that if he continued to employ non-union men the unions would do their best to injure his business, and on his declining to bind himself, the defendant, a person in authority in the trade-union, called to the employer's men to quit work, which they did. This conduct also was decided to be no longer criminal. There was no malice in fact toward the employer, the purpose of the men being to obtain higher wages.

"Here is the language of the English court in the very recent case, *Curran v. Treleaven*, cited above, which may be said to express the latest position of the English law on this question :

"The recorder held that the agreement to strike to benefit themselves would be no lawful agreement, a strike which would have the effect of injuring the employer is illegal and indictable at common law. He cites in support of this view some phrases from the judgments of the Lords Justices in the case of *Mogul S. S. Co. v. McGregor & alcs.* But with deference he has somewhat misapprehended the point of those observations. It is true that where the object is injury, if the injury is effected an action will lie for the malicious conspiracy which effected it ; and therefore it may be that such a conspiracy, if it could be proved in fact, would be indictable. But it was pointed out in some detail by the court of first instance, that when the object is to benefit one's self, it can seldom, perhaps it can never, be effected without some consequent loss or injury to some one else. In trade, in commerce, even in a profession, what is one man's gain is another's loss ; and where the object is not malicious the mere fact that the effect is injurious does not make the agreement either illegal or actionable and therefore not indictable."

Prior to 1830 conspiracy was not defined by statute in the United States, and the questions which arose with regard to the legality of the proceedings of the early trade-unions were decided according to the principles of the common law inherited from England. All the leading conspiracy prosecutions in America have grown out of shoemakers' strikes, and in each case members of shoemakers' organizations were arraigned for striking against non-union labor. In the first three cases, that of the Philadelphia cordwainers in 1806, that of the New York cordwainers in 1809, and that of the Pittsburg shoemakers in 1815, the defendant workmen were convicted. The case of the *People of New York v. Fisher* in 1834 was tried after the revisers, who codified the common law in 1830, had made some important changes. The statute of conspiracy of 1830 in its final form contained the following sections :

"Sec. 8. If two or more persons conspire . . . to commit any act injurious to the public health, to public morals, or to trade or commerce, or for the perversion or obstruction of justice or the due administration of the laws, they shall be deemed guilty of a misdemeanor.

"Sec. 9. No conspiracies, except such as are enumerated in the last section, are punishable criminally."

Trade and labor combinations were, therefore, only punishable as acts injurious to trade or commerce, and the conviction of the defendants in the case of the *People v. Fisher* was based upon the view that in combining to fix a price for their labor, and agreeing not to work for any employer who paid a workman below this rate, the action of the defendants was injurious to trade.

A contrary decision was, however, given in Massachusetts in the case of the *Commonwealth v. Hunt*, 1845, when it was decided that a strike against non-

The United States.

unionists was not a criminal conspiracy unless it could be shown that the means employed were criminal.

In 1870 the New York Legislature took combinations to raise or maintain wages out of the category of conspiracies to commit acts injurious to trade or commerce. In 1881 the Penal Code enacted in New York, added to the previous definition of criminal conspiracy a section defining it to be an agreement "to prevent another from exercising a lawful trade or calling, or doing any other lawful act by force, threats, or intimidation, or by interfering or threatening to interfere with tools, implements, or property belonging to or used by another, or with the use and employment thereof." In 1882 the following section was added:

"Sec. 170. No conspiracy is punishable criminally unless it is one of those enumerated in the last two sections, and the orderly and peaceable assembling or cooperation of persons employed in any calling, trade, or handicraft for the purpose of obtaining an advance of wages or compensation or of maintaining such rate is not a conspiracy." A clause borrowed from the English statute (38 and 39 Vict. c. 86) passed in 1875 after the gas stokers' strike was also added:

"Sec. 673. Endangering life by refusal to labor. A person who wilfully and maliciously, either alone or in combination with others, breaks a contract of service or hiring, knowing or having reasonable cause to believe that the possible consequences of his so doing will be to endanger human life, or to cause grievous bodily injury, or to expose valuable property to destruction, or serious injury, is guilty of a misdemeanor." In the case of the People *ex rel.* Gill and others in 1887 it was decided by Judge Barrett, of New York, that strikes are only permissible when wages are directly at issue, and then only if there be no turbulence or disorder. In the opinion of the New York Bureau, therefore, the tendency of the legislation in that State concerning conspiracy has been retrograde, for the Penal Code comes near to recognizing the principle of the old "conspiracy to injure or prejudice another," which was abandoned when the common law was revised in 1830.

In Massachusetts also the Supreme Court intimated lately in the case of *Carew v. Rutherford* that a combination to compel an employer to pay money under threat of a strike was a criminal conspiracy. On the other hand, the same principle was turned against some Connecticut employers, who blacklisted a workman in 1866, when the judge declared that "any conspiracy to prevent, obstruct, or hinder any man from putting his labor on the market is highly criminal at common law." Twenty-four States of the Union have conspiracy statutes—*viz.*, Alabama, Arkansas, Delaware, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Michigan, Missouri, Nebraska, New Jersey, New York, North Carolina, Pennsylvania, South Carolina, Tennessee, Texas, Vermont, Virginia, and Wisconsin.

The law as it stands at present in these States is a subject of complaints on the part of working men, who hold that if strikes to enforce union rules are declared to be combinations in restraint of trade, trusts, pools, and other combinations of employers to raise prices or limit production should come under the same ruling. (See also CONSPIRACY LAWS; INJUNCTION.)

BRACE, CHARLES LORING, was born at Litchfield, Conn., in 1826; graduated from Yale in 1846; studied theology at the Yale Divinity School, 1847-48, and at Union Theological Seminary, New York, 1848-49. In 1850 he made a pedestrian tour through Great Britain and Ireland, and also visited the Rhine, Belgium, and Paris. The following year he visited Hungary, and was arrested there on suspicion of being a spy, and was tried before a court-martial. He was released through the efforts of C. J. McCurdy, United States *Chargé d'Affaires* at Vienna, and the Austrian Government amply apologized to him for the transaction. He afterward visited Switzerland, England, and Ireland, giving especial attention to schools, prisons, and reformatory institutions, and returned to the United States in 1852. Here he entered into active missionary labors in New York City, working among the most degraded classes, and was one of the founders of the Children's Aid

Society—an association for supplying destitute and vagrant children with homes in the country, and also for providing to a large extent lodgings, instruction, and other aid for poor boys and girls in the city—and of this society he was, after the first year, the secretary and principal agent till the time of his death. In 1854 he established the first newsboys' lodging-house in the city; in 1855 an Italian industrial school; and in 1856 a German industrial school. He devoted the remainder of his life to work among the children and youth of the poor of New York City.

He was a delegate to the International Convention of Children's Charities in London in 1856, and took a journey into Northern Europe; made a sanitary investigation of the principal cities in Great Britain in 1865, and was a delegate to the International Prison Congress in London in 1872, at which time he revisited Hungary, where he was received with marked attention. His work in New York City became known throughout Europe, and his advice was very often sought by those engaged in philanthropic enterprises for the poor and for the young. For more than 20 years he was an editorial writer for the *New York Times*, and a contributor to its book reviews, generally confining himself to theological and philanthropic subjects. He died in the Tyrol, Switzerland, August 11, 1890.

Mr. Brace is the author of the following works: *Walks and Talks of an American Farmer in England; Hungary in 1851* (1852); *Home Life in Germany* (1853); *The Norse Folk* (1857); *Short Sermons to Newsboys* (1861); *Races of the Old World* (1863); *The New West* (1868); *The Dangerous Classes of New York, and Twenty Years' Work among Them* (1872, third edition, 1880); *Free Trade as Promoting Peace and Good-will among Men* (1879); *Gesta Christi; or, A History of Humane Progress under Christianity* (1883, third edition, 1885), and *To the Unknown God* (1889).

BRADLAUGH, CHARLES, M.P. (1833-91), a son of a solicitor's clerk in the East End of London, was reared in very orthodox fashion. When being prepared for confirmation at the church which he attended, he was in doubt about some of the doctrines taught, and inquired of the clergyman. The answer he received was a severe rebuke for daring to doubt; and this was the turning-point in the career of this "iconoclast." Not finding the knowledge he craved in the Church, he turned to the street lecturers, and there heard many of the free-thought speakers; finally, tho' but a boy, becoming a speaker himself. On account of his ideas he had been compelled to leave his father's house, and he endeavored to gain a living as coal agent. That not succeeding, in 1850 he enlisted in the Dragoon Guards, serving for some time in Ireland. In 1853, having received his discharge, he returned to London and became a clerk in a solicitor's office. From that time he became known all through the country as an anti-theological lecturer, and wrote under the pseudonym of "Iconoclast." He also took a very active and oftentimes a leading part in all the radical movements of the time.

The struggle of Italy for independence; the cause of the North, in the Civil War in the United States; the Reform League agitation of 1866, and the Fenian outbreak which followed—all enlisted his sympathy and aid. In 1860 he started his paper, *The National Reformer*, which in 1868 was prosecuted by the Government. The prosecution was abortive, however, and led to a repeal of the law under which the proceedings had been taken. In 1872 he published his book, *The Impeachment of the House of Brunswick*, which is, perhaps, his best-known literary work. In 1873 he undertook two lecturing tours in the United States. In 1875 he, with Mrs. Annie Besant, was tried for having republished an old pamphlet, *The Fruits of Philosophy*. The result of the trial was that the defendants, tho "exonerated from all corrupt motive," were sentenced to six months' imprisonment, and to pay a fine of £200. On appeal, however, the sentence was reversed. In 1868 and twice in 1874 he was an unsuccessful candidate for parliamentary honors; in 1880, however, he was elected as junior member for the borough of Northampton. Now commenced the struggle with the House of Commons, by which his name will be best known. Refusing to take the oath of allegiance, and desiring to affirm, he was not allowed to sit, and his seat was declared vacant. Re-elected in 1881, he was expelled by force. Again elected in 1882, but still debarred from sitting, he resigned, in order to again appeal to his constituency in 1884; and tho again elected, it was not till after the general election of 1885 that he was allowed to take his seat. In 1887 he was instrumental in getting appointed the Royal Commission on Market Rights and Tolls, and carried through Parliament an "Act amending and extending the truck laws." In 1888 he brought in an "Affirmation Bill," which was carried. In 1889 he was requested by the Indian National Congress to represent their national interests in the English Parliament. A consistent individualist, he combated at every step the growing tide of socialism, and lost no opportunity, either by voice or pen, of attacking what he thought to be the errors advocated by socialists.

BRASSEY, SIR THOMAS, born in 1836; English economist and writer on naval affairs. His father was a railroad contractor. He was called to the bar in 1864, but never practised. In 1865 he was elected Member of Parliament for Devonport, and he remained in Parliament for a number of years. Naval matters called forth his chief attention. He assisted in forming the naval artillery volunteers. He and his wife, in their yacht "Sunbeam," have made many long voyages to all parts of the globe. Among numerous shorter writings on naval affairs and social questions he has published *Work and Wages*; *British Seamen*, and *Lectures on the Labor Question*.

BRAY, CHARLES (1811-84), an English social reformer on the lines of Robert Owen and Thomas Carlyle. Born at Coventry, he became a ribbon manufacturer in that city. He saw the opening of Harmony Hall in Queenwood Community (see OWEN), but the failure of that ex-

periment convinced him that such attempts were premature. He wrote *The Philosophy of Necessity* (1841), with an appendix by his sister-in-law, Mary Hennell, later published separately as *An Outline of the Various Social Systems and Communities which have been Founded on the Principles of Cooperation* (1844); also several essays and addresses, notably *An Essay upon the Union of Agriculture and Manufactures and upon the Organization of Industry*; also an autobiography (1884).

BRAY, J. F.—An English communist of the school of Owen, of whom little is known save his book, written in 1839, *Labour's Wrongs and Labour's Remedy; or, The Age of Might and the Age of Right*. This work, to-day almost forgotten, is one of the ablest of its day, and is noticed at some length in Marx's *Philosophy of Misery* (1847) and other writings of the times. Palgrave's *Dictionary of Political Economy* says of it: "The book tries to prove that all those who perform equality of labor ought likewise to receive equality of reward" (p. 30), and tho he admits that even this does not involve perfect justice, that "such equality is infinitely more just than the mode of rewarding labor under the present system" (p. 206). Impressed by the modern growth of joint-stock companies, Bray proposes a "joint-stock modification of society, admitting of individual property in productions in connection with a common property in productive powers" (p. 194), and proposes a paper and pottery currency, whose foundation is labor, in order "to secure the public against any other variations in the value of the currency than those to which the standard itself is subject" (pp. 143, 198).

BRENTANO, LÜJO, professor at Breslau; best known outside of Germany by his *History of English Guilds* (1871), and his larger work on English trade-unions (1872), works, however, which are by most not considered complete or satisfactory. He was one of the founders of the Association for Social Politics or "Socialists of the Chair" (*g. v.*), as they are called in Germany, altho belonging to the extreme right of this school.

BRETHREN OF SOCIAL LIFE, sometimes called Brethren of the Common Lot, Brethren of the Common Life, or Brethren of Good Will, a fraternity founded by Groote and Radewin in 1376. It professed to imitate the earliest Christian communities, and eventually merged into the sect of Moravians. It was composed of pious persons who sought to elevate their souls by spiritual exercises; and it was sanctioned by several popes and councils. Community of goods, industry, frugality, education of the young, and the use of the vernacular language in religious worship were some of their peculiar usages. They bound themselves by no monastic vow. In 1430 they had 130 societies, chiefly in Germany and the Netherlands. The original founders were opposed to all learning and science that was not moral and practical; but the brethren rendered valuable service to the cause of popular and free education, and have been called the pioneers of the Reformation. Thomas

à Kempis belonged to one of these societies. Similar female societies were organized, each under a superior or *Martha*.

The Order of the Brethren of the Common Lot was divided into two classes, the lettered brethren, or clerks, and the illiterate; they lived in separate habitations, but maintained the closest fraternal union. The former devoted themselves to preaching, visiting the sick, circulating books and tracts, etc., and the education of youth, while the latter were employed in manual labor and the mechanical arts. They lived under the rule of St. Augustine, and were eminently useful in promoting the cause of religion and education.

The theory of this community was that unity should be sought rather in the inward spirit than in outward statutes. Vows were not binding for life. Property was surrendered, not on compulsion, but voluntarily. All the brother houses were kept in communication with each other, and the heads of houses met annually for consultation. Particulars of their rule, domestic arrangements, etc., may be found in Ullmann's *Reformers before the Reformation*, ii. 89 *sq.* Luther and Melancthon spoke with approval and sympathy of the brotherhood in their time. Its flourishing period extended from 1400-1500. Most of their houses were built between 1425 and 1451, and they had, in all, some 30 to 50 establishments. During the sixteenth century the Reformation broke them down, in common with other monkish establishments; or, rather, they crumbled to pieces as needless amid the new developments of the age. By the middle of the seventeenth century the brotherhood was ended.

BRICKLAYERS (English). See TRADE-UNIONS, section "England."

BRICKLAYERS' AND MASONS' INTERNATIONAL UNION, THE, was founded in the city of Philadelphia, October 16, 1865. At present (1895) it numbers 230 subordinate unions and over 30,000 members. In 1885 it established the nine-hour system of working, the several of the subordinate unions are working on the eight-hour basis. The organization is a purely protective association. In 10 years it has expended nearly \$200,000 to sustain strikes, and over \$1,500,000 for benevolent purposes.

BRIGHT, JOHN, an English politician, was born at Greenbank, Lancashire, in 1811. He was the son of Jacob Bright, a Quaker cotton-spinner. In his sixteenth year he entered his father's factory, but early became interested in temperance, parliamentary reform, and other questions of the day. The reform struggle of 1832 moved him deeply. In 1839, when the Anti-Corn-Law League was formed, he and Cobden were the leading members of it, and commenced a free-trade agitation throughout the kingdom. In 1841 he suffered a severe loss by the death of his wife, and in his grief Cobden bade him devote himself to the repeal of the corn laws. He became M.P. for Durham in 1843. His eloquent and energetic advocacy of free trade produced at last the repeal of the corn laws. He was associated with Cobden in a movement for financial reform, and later with a

movement to reform the system of electoral representation. He came to be with Cobden the head of the so-called "Manchester School" (*q.v.*), and vigorously opposed the ten-hour movement and almost all industrial legislation. Being a member of the Peace Society, as well as of the Society of Friends, he strenuously opposed the war with Russia in 1854. Some of the severest denunciations of war ever uttered are to be found in his speeches. In 1857 he was elected from Birmingham, and long represented that city. He strongly condemned the then existing game laws of Great Britain. In 1868 he accepted the presidency of the Board of Trade in Gladstone's administration, and worked for the disestablishment of the Irish Church and the Irish Land Act, aiming at peasant proprietorship. In 1870 he resigned from office on account of ill health, but took office again in 1873-74, and 1882 as chancellor of the duchy of Lancaster. In 1886 he opposed the Home Rule bill introduced by Mr. Gladstone. In 1883 he became lord rector of the University of Glasgow. He died in his boyhood's home, March 27, 1889.

BRINKERHOFF, GENERAL ROELIFF, was born in Owasco, N. Y., June 28, 1828. Entering the law, the war called him to distinguished service, but at its close he resumed law practice in Mansfield, O. In 1873 he became a banker. For more than 10 years he held a high place in the ranks of philanthropy—a student of the problem of the defective, delinquent, and dependent classes. In 1878 he was appointed by Governor Bishop a member of the State Board of Charities, in which he has since served, having been reappointed by Governor McKinley.

He studied crime and charity in the institutions that deal with their problems in all parts of the land, and in the conventions called for their consideration. It is largely to his credit that Hon. F. B. Sanborn, of Massachusetts, places the prison system of Ohio above that of all other States. He aided in the establishment of the Elmira Reformatory, as an expression of his belief that prisons should be conducted not for punishment, but for reform. He protests with voice and pen against the indiscriminate association of criminals in county jails, where "old offenders" are allowed to corrupt "first offenders." Altho a strong Democrat, he advocates the elimination of all party politics from prison management. "As a hospital flag on every battlefield of civilized warfare is an emblem of neutrality, so, and more so, in political warfare," he says, "the asylums of our dependent and defective classes should be sacred from the attack of contending parties."

In 1880 General Brinkerhoff was made President of the Seventeenth National Conference of Charities and Corrections. He is the author of numerous addresses and papers on crime and charity.

BRISSOT, JEAN PIERRE, surnamed **De WARVILLE** (1754-93), was born at Chartres, of humble parentage. Educated for the law, he entered the office of a procurator at Paris, but early devoted himself to political sci-

ence. His *Théorie des Lois Criminelles* (1781) and *Bibliothèque Philosophique de Législateur* (1782) brought him notoriety and the favor of Voltaire, D'Alembert, and others. They were imbued with the philosophy of Rousseau, and contain the saying, afterward made famous by Proudhon, "*La propriété, c'est le vol.*" A facile writer, he wrote for papers unworthy of him, but later went to London and started *Le Journal du Lycée de Londres* to unite all the savants of Europe. Returning to Paris, he was lodged in the Bastille on an unfounded charge. Released after a few months, he recommenced pamphleteering, and in London meeting some abolitionists, he organized in Paris a Société des Amis des Noirs. He visited the United States, but returned to play a leading part in the French Revolution. He edited the *Patriote Française*, and in the National Assembly leagued himself with the Girondists, then often called the Brissotins. He bravely suffered death on the guillotine with the Girondists, October 30, 1793.

BRITISH ECONOMIC ASSOCIATION, THE, was founded at a meeting held at University College, London, on November 20, 1890, the Rt. Hon. G. J. Goschen, M.P., being in the chair. The object of the association is the advancement of economic knowledge by the issue of a journal and other printed publications, and by such other means as the association may from time to time agree to adopt. The journal represents all shades of economic opinion, and is the organ not of one school of economists, but of all schools. The annual subscription is one guinea. There is at present no entrance fee. Any member may at any time compound for his future yearly payments by paying at once the sum of 10 guineas. The current numbers of the journal, issued in March, June, September, and December, and published by Messrs. Macmillan & Co., are sent to members free of charge. The price is 5s. each copy, or one guinea (net) for the annual volume bound. The officers of the British Economic Association (1895) are as follows: President, Rt. Hon. G. J. Goschen, M.P.; Vice-Presidents, Rt. Hons. A. J. Balfour, M.P., H. C. E. Childers, Leonard H. Courtney, M.P., John Morley, M.P. The Secretary is Henry Higgs, 9 Adelphi Terrace, London, W. C.; and the editor of the journal is Professor F. T. Edgeworth, D.C.L., All Souls' College, Oxford.

BROADHURST, HENRY, was born in 1840 near Littlemore, Oxfordshire, the son of a journeyman mason. He worked at his father's trade till 1872, when he was elected to the Parliamentary Committee of the Trade-Union Congress, becoming a most indefatigable worker, and serving as secretary of the committee from 1875-90. In 1880 he was returned to Parliament from Stoke-upon-Trent. In 1885 he was elected from the Boardsley division of Birmingham; in 1886 from Nottingham (West), and at the next general election from Leicester. He has been a member of two royal commissions, and in 1886 was appointed Under Secretary of State for Home Affairs. He is a Liberal in politics, and for a long period opposed the new trade-union-

ism, eight-hour legislation, etc. He has, however, recently changed his position on the eight-hour bill, and was in 1894 deemed one of the most progressive members of the Trade-Union Parliamentary Committee.

BROADWAY STEALS.—In the year 1884 the Broadway surface railroad, in New York City, applied to the aldermen of that city for a franchise for building a surface railroad on Broadway. The franchise was given for an utterly insufficient sum. The mayor vetoed the ordinance, but all but two aldermen voted to pass the measure over his veto. Corruption was only too apparent, and the New York State Senate in the spring of 1886 investigated the matter, and as a result indicted 22 of the 24 aldermen for bribery. Some of the aldermen and some who had acted as intermediaries fled the State. Alderman H. W. Jaehne was the first tried, and after a well-contested trial was convicted and sentenced to nine years and ten months in State prison. He appealed, but the Court of Appeals confirmed the sentence. Alderman A. J. McQuade was tried, but the jury disagreed. The company was annulled and dissolved by the Legislature.

BROCKLEHURST, FRED, was born February 20, 1866, at Macclesfield, England, and is the son of a journalist. At the age of 10 he worked in a factory, left school at 12, and became successively a telegraph boy, printer's devil, and stationer. In 1885 he determined to study for the Church, entered Queen's College, Cambridge, and graduated with honors in 1892. Giving up his purpose of taking orders, he devoted himself to the labor struggle. He joined the Labor Church as general secretary, and became prominent in the councils of the Independent Labor Party. The party made him their candidate for Parliament for Bolton in May, 1894.

BROOK FARM.—The cooperative and, later, the Fourierite experiment of Brook Farm seems to have been the child of Boston transcendentalism and Unitarianism. Its leading spirit and its head from first to last was George Ripley, altho he was ably seconded by such men as Dr. Channing, Dr. J. C. Warren, Theodore Parker, George W. Curtis, and others. In 1842, 200 acres were bought in what is now Readville, a few miles southwest of Boston, and the community began. There were a few of these well-known names, but besides and contrary to a very general impression there were a great many men and women from the ordinary walks of life. The main aim was to establish a school or college, and a number of young people were received as pupils. It attracted great interest, and people flocked from all over the country to see it. Ripley, Theodore Parker, Margaret Fuller, Hawthorne, were for a greater or less time resident members. Dr. Channing and Ralph Waldo Emerson were in communication with it. All the members were stockholders, tho some gave only labor in place of stock. All took part in the manual labor of the farm, even those who were most famous with the pen. All dined in common in one central hall, and

lived mainly in one large building. The life was a happy one; and even after its failure its members looked back on the years spent there as among the happiest of their lives. There were about 115 members. The spirit was eminently religious, of the transcendental type; but there was no creed; and every one was free to believe and worship as he would. There were no religious services on Sunday or through the week. The produce of the farm, after its own necessities were provided for, were sent in by wagon to the Boston market. The spirit of the community can perhaps be best seen by an extract from *The Dial*, published from 1840-44, with Margaret Fuller as its editress, and largely the organ of Brook Farm.

The first notice of Brook Farm we find in *The Dial* is in connection with an article in its second volume (October, 1841), entitled *A Glimpse of Christ's Idea of Society*, by Miss Elizabeth P. Peabody. This article gives us Miss Peabody's conception of the original ideal of Brook Farm; a few sentences only can we quote. She says:

"While we acknowledge the natural growth, the good design, and the noble effects of the Apostolic Church, and wish we had it, in place of our own more formal ones, we should not do so small justice to the divine soul of Jesus of Nazareth as to admit that it was a main purpose of His to found it, or that when it was founded it realized His idea of human society. Indeed, we probably do injustice to the apostles themselves, in supposing that they considered their churches anything more than initiatory. Their language implies that they looked forward to a time when the uttermost parts of the earth should be inherited by their beloved Master; and beyond this, when even the name, which is still above every name, should be lost in the glory of the Father, who is to be all in all.

"Some persons, indeed, refer all this sort of language to another world; but this is gratuitously done. Both Jesus and the apostles speak of life as the same in both worlds.

"The Kingdom of Heaven, as it lay in the clear spirit of Jesus of Nazareth, is rising again upon vision. Nay, this kingdom begins to be seen not only in religious ecstasy, in moral vision, but in the light of common sense and the human understanding. Social science begins to verify the prophecy of poetry. The time has come when men ask themselves what Jesus meant when He said: 'Inasmuch as ye have not done it unto the least of these little ones, ye have not done it unto Me.'

"No sooner is it surmised that the Kingdom of Heaven and the Christian Church are the same thing, and that this thing is not an association outside of society, but a reorganization of society itself, on those very principles of love to God and love to man which Jesus Christ realized in His own daily life, than we perceive the day of judgment for society is come, and all the words of Christ are so many trumpets of doom. For before the judgment-seat of His sayings, how do our governments, our trades, our etiquettes, even our benevolent institutions and churches look? . . .

"One would think, from the tone of conservatives, that Jesus accepted the society around Him as an adequate framework for individual development into beauty and life, instead of calling His disciples 'out of the world.' We maintain, on the other hand, that Christ desired to reorganize society, and went to a depth of principle and a magnificence of plan for this end which has never been appreciated, except here and there, by an individual, still less been carried out. . . . There *are* men and women who have dared to say to one another, 'Why not have our daily life organized on Christ's own idea? Why not begin to move the mountain of custom and convention? Perhaps Jesus' method of thought and life is the Saviour—is Christianity!' . . .

"N. B. A postscript to this essay, giving an account of a specific attempt to realize its principles, will appear in the next number."

According to this, Brook Farm, in its concep-

tion, was distinctly Christian, and no less than an effort to realize the kingdom of God on earth.

In the next number of *The Dial* Miss Peabody wrote the following *Plan of the West Roxbury Community*:

"In the last number of the *Dial* were some remarks, under the perhaps ambitious title of 'A Glimpse of Christ's Idea of Society,' in a note to which it was intimated that in this number would be given an account of an attempt to realize in some degree this great Ideal, by a little company in the midst of us, as yet without name or visible existence. The attempt is made on a very small scale. A few individuals, who, unknown to each other, under different disciplines of life, reacting from different social evils, but aiming at the same object—of being wholly true to their natures as men and women—have been made acquainted with one another, and have determined to become the Faculty of the Embryo University.

"In order to live a religious and moral life worthy the name, they feel it is necessary to come out in some degree from the world, and to form themselves into a community of property, so far as to exclude competition and the ordinary rules of trade; while they reserve sufficient private property, or the means of obtaining it, for all purposes of independence and isolation at will. They have bought a farm, in order to make agriculture the basis of their life, it being the most direct and simple in relation to nature. A true life, altho it aims beyond the highest star, is redolent of the healthy earth. The perfume of clover lingers about it. The lowing of cattle is the natural bass to the melody of human voices.

"The plan of the community as an economy is in brief this: for all who have property to take stock, and receive a fixed interest thereon; then to keep house or board in common, as they shall severally desire, at the cost of provisions, purchased at wholesale, or raised on the farm; and for all to labor in community, and be paid at a certain rate an hour, choosing their own number of hours and their own kind of work. With the results of this labor and their interest they are to pay their board, and also purchase whatever else they require at cost, at the warehouses of the community, which are to be filled by the community as such. To perfect this economy, in the course of time they must have all trades and all modes of business carried on among themselves, from the lowest mechanical trade, which contributes to the health and comfort of life, to the finest art, which adorns it with food or drapery for the mind.

"All labor, whether bodily or intellectual, is to be paid at the same rate of wages; on the principle that as the labor becomes merely bodily, it is a greater sacrifice to the individual laborer to give his time to it; because time is desirable for the cultivation of the intellectual in exact proportion to ignorance. Besides, intellectual labor involves in itself higher pleasures, and is more its own reward than bodily labor. . . .

"After becoming members of this community, none will be engaged merely in bodily labor. The hours of labor for the association will be limited by a general law, and can be curtailed at the will of the individual still more; and means will be given to all for intellectual improvement and for social intercourse, calculated to refine and expand. The hours redeemed from labor by the community will not be reapplied to the acquisition of wealth, but to the production of intellectual goods. This community aims to be rich not in the metallic representative of wealth, but in the wealth itself, which money should represent—namely, *leisure to live in all the faculties of the soul*. As a community, it will traffic with the world at large, in the products of agricultural labor; and it will sell education to as many young persons as can be domesticated in the families, and enter into the common life with their own children. In the end it hopes to be enabled to provide not only all the necessities, but all the elegances desirable for bodily and for spiritual health—books, apparatus, collections for science, works of art, and means of beautiful amusement. These things are to be common to all; and thus that object, which alone gilds and refines the passion for individual accumulation, will no longer exist for desire, and whenever the sordid passion appears it will be seen in its naked selfishness. In its ultimate success, the community will realize all the ends which selfishness seeks, but involved in spiritual blessings, which only greatness of soul can aspire after. And the requisitions on the individuals, it is

believed, will make this the order forever. The spiritual good will always be the condition of the temporal. Every one must labor for the community in a reasonable degree, or not taste its benefits.

"Whoever is willing to receive from his fellow-men that for which he gives no equivalent will stay away from its precincts forever. But whoever shall surrender himself to its principles shall find that its yoke is easy and its burden light. Everything can be said of it, in a degree, which Christ said of His kingdom, and therefore it is believed that in some measure it does embody His idea. For its gate of entrance is straight and narrow. It is literally a pearl hidden in a field. Those only who are willing to lose their life for its sake shall find it. Its voice is that which sent the young man sorrowing away: 'Go sell all thy goods and give to the poor, and then come and follow Me.' 'Seek first the Kingdom of Heaven and its righteousness, and all other things shall be added to you.' . . .

"There may be some persons at a distance who will ask, To what degree has this community gone into operation? We cannot answer this with precision, but we have a right to say that it has purchased the farm which some of its members cultivated for a year with success, by way of trying their love and skill for agricultural labor; that in the only house they are as yet rich enough to own is collected a large family, including several boarding scholars, and that all work and study together. They seem to be glad to know of all who desire to join them in the spirit, that at any moment, when they are able to enlarge their habitations, they may call together those that belong to them."

This gives the spirit of the community as it lay at least in the mind of one interested soul. Its leaders had the two first requisites of a community—devotion to principle and previous acquaintance. For some two years Brook Farm continued in about this spirit. It then gradually became imbued with Fourierism, which was then flooding the land.

In the last week of December, 1843, and the first week of January, 1844, a convention was held in Boston, where, for the first time in New

England, Fourierism appeared to have much strength. (See **FOURIERISM.**)

FOURIERISM. William Bassett, of Lynn, was president; Adin Ballou, of Hopedale, G. W. Benson, of Northampton, George Ripley, of Brook Farm, among the vice-presidents; with Eliza J. Kenney, of Salem, and Charles A. Dana, of Brook Farm, secretaries. The tone of the convention was decidedly Fourieristic, and soon after this the Brook Farm community formally decided to become a Fourierist phalanx, the leader in this change being apparently William H. Channing. The constitution of the community was changed and an appeal sent out for new cooperation and investment. A workshop for mechanics of several trades was built, and a Fourierist phalanx, or unitary dwelling, 175 feet by 40 feet, was in process of erection. With this new change the Fourierist paper in New York, *The Phalanx*, was given up, and *The Harbinger* started at Brook Farm as the representative of Fourierism in America. An American union of associationists was organized, with William H. Channing as its secretary and chief mover. Missionaries or lecturers were sent out. But already Fourierism was on the wane in public sentiment, and they met with small success. Another movement was coming up. The last days of Brook Farm were more or less connected with *Swedenborgianism*. Swedenborgianism took a deeper hold than Fourierism, because it was distinctly religious. Many of the friends of Brook Farm became friendly to it. Meanwhile, events transpired to weaken the interest

in the farm itself. On March 3, 1845, a disastrous fire burned the phalanstery wholly to the ground, just as it was nearing completion. It produced a feeling of discouragement and hesitation from which the community never recovered. In the fall *The Harbinger* was removed to New York City, and soon after Brook Farm was dissolved. It had not been a financial success. It had not the capital of some of the other associations, nor any experienced practical business manager. As a *farm* it was not a success. Its transcendental members delighted to mingle philosophy and theology with manual farm labor, but their hearts were in transcendentalism, not in farm work; and the result was what could have been expected.

Reference: *Brook Farm*, by J. T. Codman (Boston, 1804).

BROOKS, J. GRAHAM, was born in 1846. He studied in Germany three years; graduated from Harvard Divinity School in 1874; occupied the Unitarian pulpit for several years; lectured upon economics at Harvard University; and in 1892 was appointed expert of the Labor Department, Washington. He is the author of the *Report upon Working Man's Insurance* in Germany, 1893; articles in *Cyclopedia of Political Science* (Macmillan, London); various articles on social and economic topics in *British Economic Journal*; *Harvard Journal of Economics*; *Forum*, etc.

He would be classed with the historical school; he believes in the municipalization of natural monopolies as fast and as far as it can be done to the social advantage; he believes in the largest measure of free trade that is practically possible; regarding the basis of the currency he is a bimetalist.

BROTHERHOOD OF CARPENTERS AND JOINERS OF AMERICA, THE, one of the most important trade-unions of the country, was organized at a convention of carpenters' unions held in Chicago, Ill., August 8, 1881. Prior to this organization many local unions had existed, and efforts had been continually made for the formation of a national organization. The first attempt was made in 1854, and the second in 1867. The preamble to the constitution sets forth the objects to be

"To rescue our trade from the low level to which it has fallen, and, by mutual effort, to raise ourselves to that position in society to which we are justly entitled; to cultivate a feeling of friendship among the craft; and to elevate the moral, intellectual, and social condition of all journeymen carpenters. It is, furthermore, our object to assist each other to secure employment; to furnish aid in cases of death or permanent disability, and for mutual relief, and other benevolent purposes."

The officers consist of a general president, eight vice-presidents, a general secretary, treasurer, and an executive board. The executive board is composed of five members, elected from the union or unions within a radius of 10 miles of the city selected as headquarters. This board has power to decide all points of law, set-

tle all grievances, and to authorize strikes in conformity with the constitution.

The constitution provides that whenever a dispute arises between an employer or employers and members of the brotherhood, the members shall lay the matter before the local union, which shall appoint an arbitration committee to adjust the matter; then, if the members of the committee cannot settle the dispute, the matter shall be referred to the union. If a two-thirds vote of secret ballot shall decide that the members shall be sustained, then they shall be authorized to strike; which strike shall take effect immediately whenever the demand is refused by the employers the following day.

The organization provides a funeral benefit of \$250 if a member dies, and \$50 in case of the death of the wife of a member. It also provides a disability benefit. The organization is opposed to piece-work.

The first convention of the Brotherhood after the organization was held in Philadelphia in 1882. The first strikes of prominence occurred in Chicago and New Orleans, where they succeeded in fixing the standard rate of wages at \$3 per day. This organization has always been unusually successful in its strikes. As early as 1886 the general secretary writes:

"In 21 cities our local unions have gained 25 cents per day advance in wages, making in all 53 cities where our local unions have made gains the past year, either in more wages or in reducing hours, while only in nine cities have our local unions failed to secure their demands, and in these cities they demanded the eight-hour system last May. A resumé shows that 2486 of our members are working eight hours per day, 5824 are on nine hours per day, and 1118 are having shorter hours on Saturdays. This makes a total gain to these members of 65,894 hours per week, adding to the gains on the Pacific Coast, which amount to 6540 hours per week, makes a sum total of 72,434 hours per week gained to our members through organization."

It was because of their complete organization and success that to the carpenters was given the honor of leading off in the great strikes of the American Federation of Labor on May 1. They showed themselves worthy of this, for an account of which see AMERICAN FEDERATION OF LABOR. January, 1894, the order had 824 lodges, with 65,000 members. The secretary is P. J. McGuire, Box 884, Philadelphia. Besides this organization there is in the trade the Amalgamated Society of Carpenters and Joiners. (See BUILDING TRADES.)

BROTHERHOOD OF CHRISTIAN UNITY, THE.—The object of this society is not to work directly for organic unity among the churches, but to promote the spirit of unity out of which alone a true and permanent union can grow. It has no constitution, but only a form of enrollment, as follows:

"For the purpose of uniting with all who desire to serve God and their fellow-men under the inspiration of the life and teachings of Jesus Christ, I hereby enroll myself as a member of the Brotherhood of Christian Unity."

The motto of the society is, "Love your neighbor and respect his beliefs." The brotherhood originated from a suggestion made by Mr. Theodore F. Seward, at a union meeting held at Orange, N. J., in April, 1891. It has two aims, and leads to two results: 1. It supplies through its form of enrollment a basis upon which all who desire to follow Christ in serving God and their fellow-men will constitute a recognized

brotherhood in any part of the world. The enrollment was accepted at the Parliament of Religions as "a suitable bond with which to begin the federation of the world upon a Christian basis." 2. The formula is a bond of union for practical work in any city, town, or community, between various societies and churches.

BROTHERHOOD OF THE KINGDOM, THE.—This organization, established in 1893, is the outgrowth, mainly in the Baptist denomination, of the earnest work of two men in New York City, but it now holds yearly undenominational conferences, and performs through its members no little practical work. Its aim is to work for the kingdom of God in the most inclusive sense. (See BAPTISTS IN RELATION TO SOCIAL REFORM.) The principles and methods of the brotherhood are thus stated:

1. Every member shall by his personal life exemplify obedience to the ethics of Jesus.
2. He shall propagate the thoughts of Jesus to the limits of his ability, in private conversation, by correspondence, and through pulpit, platform, and press.
3. He shall lay special stress on the social aims of Christianity, and shall endeavor to make Christ's teaching concerning wealth operative in the Church.
4. On the other hand, he shall take pains to keep in contact with the common people, and to infuse the religious spirit into the efforts for social amelioration.
5. The members shall seek to strengthen the bond of brotherhood by frequent meetings for prayer and discussion, by correspondence, exchange of articles written, etc.
6. Regular reports shall be made of the work done by members in such manner as the executive committee may appoint.
7. The members shall seek to procure for one another opportunities for public propaganda.
8. If necessary, they shall give their support to one another in the public defense of the truth, and shall jealously guard the freedom of discussion for any man who is impelled by love of the truth to utter his thoughts.

No sectarian or theological tests are required of members.

The brotherhood has an executive committee of five, with power to manage all ordinary business. The only officer is the secretary, who is also the treasurer. The annual dues are \$2, and all funds remaining over and above the necessary expenses are employed in the publication and distribution of literature.

BROTHERHOODS OF LOCOMOTIVE ENGINEERS and for all organizations of railway men. See RAILWAY EMPLOYEES' ORGANIZATIONS.

BROTHERHOOD OF PAINTERS AND DECORATORS OF AMERICA. See BUILDING TRADES.

BROTHERHOODS, RELIGIOUS, societies organized for philanthropic purposes, most numerous in the Middle Ages. Some of them being established without the authorization of the Church, they fell under the charge of heresy, and in several cases assumed the nature of separate sects, such as the Beghards, Beguines, Apostolic Brethren, Flagellants, etc. The last-named was subjected to severe persecution by the Church.

The old building corporations, from which sprang the Free Masons, belong under this head. Most of them were regarded with fear and sus-

picion by the Church, on account of their symbolism and secrecy. The brotherhoods that asked and received the sanction of the ecclesiastics were not secret, but devoted to the promotion of religion by stricter and more constant devotional exercises, or to the assisting of strangers, travelers, the unprotected, the destitute, the sick, and the oppressed. The noblest work was often done by these organizations. They were most numerous in Italy, Rome alone containing 100. (See articles COMMUNISM; MONASTICISM.)

BROTHERHOOD TRUST, THE.—The Brotherhood Trust (founded January 19, 1894) is an outcome of a Social Questions Conference held regularly since September, 1892, on Sunday afternoons, in the Brotherhood Church, Southgate Road, London. It was begun with only about £100 of capital, lent free of interest; and further loans are received on the same condition. It carries on trade and industry with the objects (1) of paying to every person employed in any branch of the concern not less than the trade-union wages current in the locality where the work is done; (2) of providing out of profits for all its customers old-age pensions and sickness-and-accident benefits in proportion to the extent of their respective purchases; (3) of so organizing its customers that these shall economically supply one another's wants by productive work on cooperative farms and in cooperative workshops, factories, etc., as soon and so far as such organization may be found practicable and the customers may desire to avail themselves of such employment; (4) of gradually buying up as much land as possible from private owners, and of acquiring as much as possible of the most scientific means of production, for the benefit of all who may choose to connect themselves with the organization.

The net profits from quarter to quarter are apportioned in the books of the trust to the credit of customers' pension account in proportion to the respective purchases of such customers, and except in cases of accident or illness, provided for in the rules, are not payable in any other form than either annuities to customers who have reached the age of 60, or annuities to dependent relatives of deceased customers. The pension to which a customer is entitled from the trust is equal to the annuity he could purchase from the British Government with the amount standing to the credit of his pension account. Over against every pension before it becomes payable there will always be the sum which has gradually accumulated to credit of the future pensioner's account out of the profits made on his purchases, which sum would suffice to purchase the required annuity from the Government. This sum will exist not in the form of money, of course, but in the form of business plant and means of production—a reproductive form. The first £10 placed to the credit of the pension account years before will have been put into productive activity, and will have been rolling along ever since, multiplying itself; and likewise every subsequent £10 added out of net profits will have been rolling along and multiplying. Therefore the security for the payment of every pension will not be merely a sufficient sum to purchase it on Government security, but a very much greater value existing in a reproductive form. Each pension will be simply a charge upon the proceeds of the business done, under most advantageous circumstances, with the capital of which the accumulated profits on the pensioner's own purchases (made in the days of health and strength) will form a part.

The Brotherhood Trust's methods are such as to avoid many risks besetting ordinary business concerns. Selling only for cash, it avoids all bad debts. Further, it will not start a bakery of its own until its daily sale of bread is large enough to take all that a

good-sized, well-ordered bakery would turn out. Similarly, it will not acquire a flour-mill until, in bakeries and stores and on farms of its own, it can dispose profitably of all the produce. Neither will it take over a boot and shoe factory until it has to meet a demand large enough to keep such factory working full time. It will never produce on speculation, but for an already secured demand.

The original Brotherhood Trust stores (situated at 1 and 5 Downham Road, Kingsland, London) are not intended to stand alone. They are meant to be imitated. But it is of vital importance that all efforts of a similar kind should be closely federated with each other and with the Brotherhood Trust, in order to promote the utmost economy in purchasing and producing, to assist one another by comparison and interchange of experiences, and to cooperate most efficiently toward the ultimate goal—the complete reorganization of industry and commerce on principles of fraternity.

The old-age pensions, which are perhaps at first the most conspicuous feature of the trust, are but means to a vast and lofty end. The aim is nothing less than the swallowing up of the profit-mongering industry and commerce of the world, and the transmuting of it, by a perfectly constitutional and peaceful revolution, into a fraternal organization for mutual enrichment and security. If the workers (who constitute four fifths of the grown-up population of the United Kingdom), or if any considerable proportion of the workers will but persistently and exclusively patronize trusts that do business in their interests, refusing to deal with any private capitalist when their trusts can supply their demand, they will help to build up a mighty federation, branching out over the country and across the seas, which will be able in a short time to buy up for them the means of production and distribution. Just so far as the Brotherhood Trust system extends and succeeds, there will be built up a new social order right through the old—as a new bridge is sometimes built through an old one; and when it becomes universal, the old system, fraught with so much misery, degradation, and brutalization, will be found to have vanished more effectually than if it had been shivered by explosives, and all without any earthquake shock, with the mildness and gentleness of the sunrise which shines away the night and ushers in the day.

J. BRUCE WALLACE.

BROUSSE, PAUL, was born at Montpellier, and studied medicine in Paris, becoming doctor in 1867. From 1870-71 he worked on the *Droits de l'Homme*, and in 1871 was condemned to three months' imprisonment. Escaping to Spain, he joined the anarchistic Spanish section of the International. From Spain he went to Switzerland, and meeting there Bakounin (*q. v.*), became, under his influence, a leader of the Jura Federation, an organizer of the anarchist section in Italy, and editor of anarchist publications. In 1879 he suffered imprisonment in Switzerland, and after his release went to London. Here he met Marx and Engels, and renouncing anarchism, adopted socialism. In 1880 he returned to France, and edited *Egalité* and *Prolétaire* in 1882, with Malon and his followers, separating from the Guidist socialists, and forming the "Broussist" section, or so-called "Possibilists." In 1887 he was elected to the Paris Municipal Council, and has since been a foremost leader of one section of the French socialists, but ever ready to work with any party, a policy which has resulted in his now calling himself Republican radical. His main writings are *Le Suffrage Universel et le Problème de la Souveraineté du Peuple* (1874) and *La Crise* (1879).

BROWN, JOHN (1800, hanged December 2, 1850), an American abolitionist, best known as the leader of the Harper's Ferry insurrection, designed to incite the slaves of the Southern States to rebellion, and thus secure their liberties. Originally intended for the Church, he

Methods.

Aim.

was compelled to give up study for this purpose on account of inflammation in the eyes. He then took up the business of a tanner, which he carried on for 20 years. Not being very successful in this, he started business as a wool dealer in Ohio in 1840. Failing also in this, he removed to Essex County, New York, in 1849, and began to reclaim a large tract of land which had been granted to him. In 1855, having imbibed an intense hatred of slavery, he went to Kansas in order to vote, and fight, if need be, against the establishment of slavery in that territory. He soon became renowned in the fierce border warfare carried on between Kansas and Missouri, and gained especial celebrity by his victory at Ossawatimie. In one of these affrays he had a son killed, which deepened his hostility to the Southern Party. After the border agitation was settled by a general vote, Brown traveled through the Northern and Northeastern States, declaiming against slavery, and endeavoring to incite and organize an armed attack upon it. In October, 1859, at the head of 17 white and five black men, he commenced hostilities by a night attack upon Harper's Ferry, overpowering the guard and capturing the arsenal. During the next morning he made prisoners of 40 or 50 of the chief inhabitants of the town; but instead of retreating at once to the mountains with arms and hostages, as his original design had been, he lingered on in the town till evening. By this time the townsmen had recovered from their astonishment, militiamen began to pour in, and after a short but desperate conflict Brown and his handful of followers were captured. He was tried at Charlestown for treason and murder, found guilty, and sentenced to death on the scaffold within 48 hours. He met this death calmly on December 2, 1859. It may safely be said that his execution hastened the downfall of slavery in America, and his name has become a household word among abolitionists. He was a man of stern and uncompromising moral principle, and singularly brave and honest. Whatever his rashness or fanaticism, there is no question that he offered himself as a sacrifice to the overthrow of a gigantic social and political wrong.

BUBBLES.—A term commonly applied since the seventeenth century to any unsound commercial undertaking accompanied by a high degree of speculation. The first bubble of historical importance was connected with the growth of varieties of tulips in Holland. It reached its height in 1636 in Amsterdam, and in the most of the Dutch cities regular markets were established for speculation in the roots. In the end tulips were bought and sold like shares in a gold mine, for purely speculative purposes, without any idea of actually growing the flowers. Fabulous prices were paid for single bulbs—*e.g.*, 2500 florins for a "Viceroy," a "*Semper Augustus*" 5500 florins, etc. The mania spread to some extent to London and Paris, and tulips were dealt in by the stock-jobbers of both cities. In 1719 and 1720 occurred the greatest speculative mania on record, arising from the Mississippi scheme of John Law (*q.v.*). In England the word bubble is generally associated with the South Sea Bubble (*q.v.*).

BUCHÉZ, PHILIPPE JOSEPH BENJAMIN (1796–1865), was born at Matagne-la-Petite; in 1825 he became a doctor of medicine. He was one of the founders of the French Carbonari (*q.v.*), and barely escaped condemnation to death for his part in the Belfort conspiracy. He then joined the Saint Simonian school, and worked on the *Producteur*. When this passed into the hands of Enfantin, he left it to found, with Roux Lavergne, a so-called neo-Catholic school, combining Catholic and revolutionary ideas, and from 1831–38, altho with some breaks, he brought out his *l'Européen*. A *résumé* of his ideas appears in his *l'Européen* for 1835, in which he declares that it is time to realize the social principles of Christianity. His idea was to reach communism through industrial cooperation, and in 1831 he founded a co-operative association of cabinet-makers, thus introducing cooperation in France, and to the spread of cooperation he devoted the rest of his life. (See COOPERATION.) In the revolution of 1848 he was a follower of Louis Blanc, and was in the chair as president of the National Assembly on the memorable May 15. After the *coup d'état* of 1851 he returned to his studies and to private life. His main works are *Essai d'un Traité complet de philosophie* (3 vols., 1839–40) and *Histoire parlementaire de la Révolution Française* (1833–38 and 1845–47).

BUDGET (from *L. bulga*, Fr. *bougette*, a little bag), is used in social science for a statement of the probable revenue and expenditure for a nation and sometimes for a family. (For representative family "budgets" see EXPENSES.)

BUENOS AMIGOS, COLONY OF.—Don José Rodriguez, a socialistic Peruvian, obtained in 1853 from the Government of Peru a large land grant on the Cototo River, and established there, with 65 others, the colony of Buenos Amigos. As he furnished most of the money for the experiment, he became director and law-maker.

The colony now (1895) has 1000 members mostly of Spanish races, but including Germans, English, and Americans. The increase has been chiefly from births, tho recruits are received upon evidence of good character and the payment of \$500 each to the common treasury.

Negroes and Indians are excluded, and religious proselytism is forbidden.

Lands, tools, and products are the property of the community, and all surplus products are sold abroad, the proceeds going to the common treasury. Rations are distributed alike to all; but whoso will pay for luxuries, whether of food, clothing, or household furniture, may obtain them from the common store. The imperishable portion of such things, however, remain common property even when in the hands of the individual.

The community is divided into departments, divisions, and sections. Each section chooses and may remove its own head, and heads of sections nominate division directors, who in turn choose department chiefs. These last are removable only by a majority vote of the community. They are, in effect, ministers of works, education, trade, and health, those being the titles of the departments, and collectively they constitute a tribunal discharging duties elsewhere confided to Ministers of Justice and Finance.

The Department of Works looks after agriculture, stock-raising, mining, manufactures, and all public works. That of Education deals with schools, music, and the mechanic arts;

Method of Life.

That of Trade with exports, imports, and the distribution of products; that of Health with houses, hospitals, and young children. An hour's work is the unit of the financial system, and the monetary table runs thus:

- 60 minutes one hour.
- 8 hours one day.
- 5 days one week.
- 4 2-5 weeks one month.
- 12 months one year.

State notes of equal size but different colors represent each of these denominations. The hour is arbitrarily fixed for the purposes of outside trade at a value of about 28 cents. Minute notes, worth about one half a cent, are for small transactions. These notes are given in exchange for work done. The time notes are guaranteed by a reserve of bullion exceeding the face value of the whole issue. A member quitting the colony may exchange his notes for Peruvian money, and in addition he will receive his share of the profits.

Altho the full working day is eight hours, only four hours, and for only five days a week, are exacted. From that no adult in sound health can escape. Any person failing to work 20 hours in the five days that constitute the working week must make up that time on Saturday or Sunday. Under the eye of an overseer armed with a leather strap, if this enforced labor is done in slovenly fashion, the culprit is beaten with the strap.

There is no marriage law. A man and a woman live together in free union, and either may find another mate when tired of the arrangement. A woman at the approach of childbirth goes to a hospital and stays there with her child until it is weaned. Then she leaves it in the hospital to the care of trained nurses.

From the hospital the child goes to a public school, where it lives night and day until grown to the age when work is exacted of all. Then the new member of the working community is set at whatever task his or her aptitudes, as developed at school, seem to point out as the proper one. The pay is the same for every kind of labor.

Private houses at Buenos Amigos are plain, but airy. A large, common building is handsomely built of freestone and marble taken from the community's quarries. The streets are well made and clean, and an aqueduct to bring in water from the Cototo River is nearly completed. All these public works are carried on by the labor of the community, under the direction of the departments. When one department has more workmen at its command than it needs they are turned over to such departments as are short of hands. Thus everybody is kept busy at least four hours a day, and as much longer as he will, with pay for overtime.

BUILDING ASSOCIATIONS are of many kinds, but may be described in general as joint-stock or cooperative societies for the purpose of raising by periodical subscriptions a fund to assist members in building or purchasing, the property being mortgaged to the society till the amount advanced is fully repaid.

The first association in America was organized January 3, 1831, at Frankford, near Philadelphia. It was called the Oxford Provident Building Association, and was started as a philanthropic measure, but the city of Philadelphia, Pa., deserves the credit of having first utilized the institution to any great extent. The first association in that city was organized in 1840, and since then the growth of the associations throughout the United States has been phenomenal. They have become subjects of statutory legislation in many States of the Union, and have lately been favored by the United States Commissioner of Labor with a special and thorough inquiry.

The building and loan association is practically a cooperative savings bank. It differs from the ordinary savings bank mainly in its methods of receiving deposits and lending money. Its chief advantage for the people over the ordinary savings institution is that its funds are used by the depositors themselves to advance their own interests,

Varieties.

while the funds deposited by wage-earners in the old-line savings banks are largely borrowed by business men and corporations and used to advance the inter-

ests of capital. Another point in favor of the building and loan association is in the fact that every member has a voice and vote in the management of it and shares in the total profits. In favor of the old-line savings banks, however, it should be said that they are indispensable to the wage-earners of many communities, and especially so in those sections where land values are so high as to practically prohibit the operation, among working men, of building and loan associations.

There are two forms of these associations: one serial and the other permanent. The general plan of the serial association is to issue a fraction of its capital stock, usually one tenth, in what is known as a "series," and to require that it be paid in monthly installments, commonly called "dues," usually at the rate of 50 cents per month on a share of stock worth, at par, \$100, and \$1 per month on a share of stock the par value of which is \$200. Whenever the monthly payments, with the accumulated profits, equal the face value of the shares the series is retired, each shareholder receiving the face value of his share in cash, unless he has in advance borrowed money of the association to the full face value of his shares, when his debt is considered paid and cancelled. When one series has matured, then a second series is issued, and so on until the entire capital stock is exhausted. A series usually extends over 10 or 12 years.

The permanent association differs from the serial association in that a person may become a member of it at any time without paying in any back dues. In a permanent association the profits are divided annually or semi-annually among the members, and credited to their respective accounts on their individual pass books and the books of the association.

A person may withdraw from the membership of either a serial or a permanent association at any time with a share of the accumulated profits. In a serial association the percentage of profit that may be taken out by a withdrawing member is generally fixed by the rules of the association at a lower rate than is awarded the member who stays in the association until the series matures. This is done to insure the participation of the withdrawing member in any possible and unforeseen losses that may befall the association. When the rules of a serial association allow a withdrawing member only 5 per cent. per annum on his investment, it is assumed that the association may suffer vicissitudes and may not earn more than 5 per cent. per annum for the entire term of the series. But a fairly prosperous association generally earns from 8 to 10 per cent. per annum on a series. In some States both serial and permanent associations are required to set aside, in a contingent fund, a certain percentage of their profits before the payment of each annual or semi-annual dividend, to insure the equal participation of all members in the losses of the association.

The funds of a building and loan association are made up of membership fees, moneys received from sale of stock, interest on loans, premiums on priority of loans, fines for non-payment of indebtedness due the association by its members, and fees for transferring stock. The income of the association is augmented by low expenses: The association meets only once in a month, and then in a cheap hall, and the officers—save the secretary, the treasurer, and the attorney—serve without pay.

When a person enters the membership of a serial association he pays a membership fee, and subscribes for one or more shares of stock on which he agrees to make a monthly payment of 50 cents or \$1 per share until maturity of the series or withdrawal before then. Should he fail to pay his monthly installment or dues within the required time, he is called upon to pay a fine into the treasury of the association, and for failure to make his monthly payments for a fixed number of months he forfeits all he has paid into the treasury. Should he at any time transfer his shares of stock to another person, he or the assignee pays the association a fee for making the transfer on its books.

When he desires to buy or build a home he endeavors to borrow from the association as much of the needed amount as his interest in the association will allow: he cannot borrow more than the face value of his shares. He applies to the association when it has money to loan, and should he bid a higher premium for the use of the money than any other member the loan is awarded him.

This premium is a payment of a few cents on each share, over and above interest, for the use of the money. It is paid with the dues each month, or is deducted from the amount of the loan. Upon securing the right to the use of the money, he designates his proposed real estate security, and when the title is ap-

proved by the association's attorney the money is advanced him and he gives the association a mortgage on the property for the amount. He also assigns stocks to the face value of the loan to the association, and agrees to keep up his monthly payments thereon. After securing the loan, the borrower pays to the association every month, in addition to his regular dues, the premium and interest on the loan, or the premium may have been deducted from the loan before it was paid over to the borrower. When, at the conclusion of the series, the face value of the borrower's stock is equivalent to the amount of money loaned him the association applies the stock to the payment of the mortgage, and the member, instead of receiving a cash payment, is given notice of the cancellation of his mortgage.

As a rule, the money paid into an association by a borrowing member during the life of the series in which he is interested amounts to little more than the rental price of the mortgaged property for the same period, and hence the saying sometimes heard among persons interested in these associations, "The rent pays for the place." In a permanent association the borrower may extend his payments—or "dues," interest and premium—over any fixed number of years, and so make the monthly payment on his real estate less than it would be under the serial plan.

The serial associations, however, have proved far more successful, and are almost the only ones now in use.

Neither of these plans, however, was the original form. The original method is described in *A Treatise on Cooperative Savings and Loan Associations*, by Seymour Dexter :

In the primitive building associations of Philadelphia there was but a single series of stock issued; every person taking shares of stock, subsequent to the date of the first issue of shares, was obliged to pay back dues in order to be in the same position he would have been had he taken his stock at the date of the first issue, so that each shareholder paid the same amount per share into the association regardless of the time when he took his shares. The money was loaned only to shareholders. Inasmuch as only one series of stock was issued, the lifetime of the association was limited to the time that it took for the shares to reach their matured value. This scheme necessarily involved the condition that every shareholder remaining in the association at the time the stock matured must be a borrower to the amount of the matured value of shares held by him. Let us make this clear. Suppose the charter of the association limited the number of shares it could issue to 500, and that during its lifetime it had issued that number. After the payment of its running expenses the funds received could be used for only two purposes—*viz.*: the making of loans to its own members and paying shareholders who withdrew. Suppose that of the 500 shares issued 300 had been withdrawn, leaving 200 outstanding when attaining their matured value. Assume the shares were \$200 each at their matured value. Now, 200 shares at \$200

each is \$40,000. Before the shares can be matured the association must have \$40,000 of assets. The assets consist of the money due from the shareholders to the association upon loans. As no shareholder can borrow a larger sum than the matured value of the shares held by him, it follows that no shareholder can owe the association for borrowed money a larger sum than the association will owe him when his shares of stock have matured; therefore, each shareholder must owe the association a sum equal to that which the association will owe him upon his matured shares. The only limitation or exception to this statement of the case will arise in reference to the dues paid at the last meeting. The amount of those dues will not have been borrowed, and will be due to some shareholder or shareholders in excess of the amount owing by him or them to the association.

But as the association progresses from year to year toward the maturity of its stock, it might not happen that there are shareholders who desired to borrow. What then? It would not do to have the dues paid in from month to month remain uninvested; no profits would accrue, and the result would be unsatisfactory. Under the scheme of a single series the association has the power to compel shareholders to borrow the funds. They are called forced loans; and their articles of association and bylaws determine who should become the borrower when there are no shareholders wishing to borrow.

This scheme is known as the terminating plan. It involves three serious defects which it was very desirable to obviate—*viz.*: the dissolution of the association when the stock matured; the large amount of back dues which the new stockholder would have to pay who took stock after the association had been running for some time, and, lastly, the making of forced loans—that is, compelling the shareholder to become a borrower whether he wanted to do so or not.

Concerning the statistics of building associations in the United States, the report on the subject by the United States Commissioner of Statistics. Labor (1893) says :

"The investigation, the results of which are now under consideration, comprehends practically all building and loan associations in the United States. An effort was made to secure the facts for these associations as they existed at the end of their respective fiscal years nearest to January 1, 1893. In a few cases, however, this was not possible, and the facts for an earlier or later fiscal year were taken instead.

"In addition to the associations from which the data have been received that constitute the body of this report, the Department has information of the existence of some others. From a very few of these some details were obtained, but from most of them nothing. The information as to the existence even of most of them is from hearsay only. They are unimportant, being either newly formed or feeble. Nearly all are supposed to be local. Total, 91.

GENERAL RESULTS FOR THE UNITED STATES.

"The total dues paid in on installment shares in force plus the profits on the same of the building and loan associations of the country, as stated, amount to \$450,667,504. A business represented by this great sum, conducted quietly, with little or no advertising, and, as stated, without the experienced banker in charge, shows that the common people, in their own ways, are quite competent to take care of their savings, especially when it is known that but 35 of the associations now in existence showed a net loss at the end of their last fiscal year, and that this loss amounted to only \$23,332.20. Of course, associations disband for the want of business or from some other cause, but when they disband loss does not occur, because the whole business of the association consists of its loans, and these loans are to its own shareholders, as a rule, who hold the securities in their associated forms. A disbanded association, therefore, simply returns to its own members their own property.

"The terms local and national have been used. A local building and loan association and a national building and loan association conduct their business under substantially the same method. The local association, however, confines its operations to a small community, usually to the county in which located, while the national operates on a large scale, extending its business enterprise far beyond the borders of its own State even. The national is ready usually to make loans on property anywhere and sell its shares to any person without reference to his residence. At the present time the prejudice which has existed for many years against nationals is being overcome, and they are conducting their business, as a rule, with the same integrity that the locals display in the conduct of their affairs. There is a jealousy, to some extent, between locals and nationals; but with proper laws in every State to regulate, control, and supervise both nationals and locals, as savings banks and all other banks are regulated and supervised, there ought to be little or no trouble in securing the honest administration of their affairs. Some States bring their building and loan associations under the same general supervision of law thrown around savings banks. New York, Massachusetts, New Jersey, Ohio, Illinois, and some other States, as will be seen by the compilation of laws relating to building and loan associations published at the close of this work, require such associations to make annual returns in the same manner as savings banks. In other States, however, nothing is officially known of the building and loan associations beyond the formalities of their incorporation."

In regard to the kinds of associations and their geographical distribution and other statistics this report says (p. 24) :

"There are 5508 local associations, of which 3168, or 56.6 per cent. of the whole, are serial, 1671, or 29.8 per cent. of the whole, are permanent, and 759, or 13.6 per cent., are terminating; that of all the associations in the country, 240 are nationals, 138, or 57.5 per cent. of all the nationals being serial, 101, or 42.1 per cent. being permanent, and only 1 terminating. The whole number, including both locals and nationals, is 5838, of which 3306, or 56.6 per cent. of the whole, are serial, 1772, or 30.4 per cent. are permanent, and 760, or 13 per cent. of the whole, are terminating.

"Examining the total associations, including locals and nationals, it is seen that Pennsylvania leads all the States, having 1070 associations. This State has but 3 nationals. The State having the next largest number is Ohio, with 721; and Ohio has but 3 nationals. Illinois comes next, with 669 associations of all kinds, 38 of them being nationals. Indiana follows, with 445 associations, 16 of them being nationals. New York ranks next, with 418 in all, 28 of them being national associations. The next largest numbers are found in Missouri, that State having 366 in all; New Jersey, 288; Maryland, 240; Kentucky, 148; California, 133, and Massachusetts, 115. In all the other States the number drops to less than 100. The numbers given for the States, respectively, will not always agree with the numbers reported by each State in its local capacity or through its State officials. This results from the fact that the account taken by the Department of Labor was for a period in most cases differing somewhat from that for which the State officials have given reports, and, furthermore, from the fact that very many companies having names in their incorporation papers which would lead one to consider them building and loan associations, upon examination are found to be entirely different. They are trust companies or associations for the purpose of erecting houses for rental

and various other objects, taking them out of the rank of cooperative building and loan associations as such.

"The State having the largest number of national associations is Illinois, with 38. It is usually supposed that the home of these associations is in the Northwest, and especially in Minnesota, but this State has only 15. There are several States having more than Minnesota, notably Tennessee, with 17; New York, 28; Missouri, 17; Kentucky, 17, and Indiana, 16. The nationals are distributed through other States in small numbers. The table shows how thoroughly building and loan associations are distributed throughout the country.

"... At the date of the conclusion of this investigation there had been 38,019 series issued, or an average of 11.8 series to each association, considering locals and nationals together. Of this whole number, 5321 had matured, this being an average of only 1.6 series of shares matured to each association. The number in force at the date named was 33,386, or 10.1 series to each association. . . . Of the 5338 associations in the country, both local and national, 4444 have reported as to homes acquired by their borrowing shareholders, and through this latter number of associations 314,755 homes have been acquired. In the 4422 associations reporting as to that fact, 283,450 buildings other than homes have been secured. Of the total number of homes acquired, 290,803 have been through local associations and 23,052 through nationals. Through the locals, 26,061 buildings other than homes have been acquired and 2398 through the nationals. . . .

"The total number of mortgages foreclosed was reported by 5440 associations, including both locals and nationals, as 8409, having a value of \$12,217,126, the loss on such foreclosures being \$449,590. Of the number of foreclosures, 7765 were by locals, having a value in the aggregate of \$11,021,394, the loss being \$441,106. The nationals had foreclosed 644 mortgages, having an aggregate value of \$1,185,732, the loss incurred being \$8493. It should be remembered that these foreclosures and losses relate to the whole lives of the associations reporting.

"The department undertook to ascertain the facts as to the kind of people who patronize and use building and loan associations. The original purpose of these associations was to enable men of small means to secure homes for themselves and to save their earnings. The question became vital, then, as to whether the motive of the associations had been preserved. It was impossible to secure the occupation of each and every shareholder in the whole 5838 associations in the country, and the attempt was not made, but we did learn the occupations of the shareholders in 909 local associations and 12 national associations, or a total of 921 associations. In 909 local associations reporting there were 159,223 shareholders, and in the 12 national associations 15,547 shareholders. In the local associations 111,383, or 69.96 per cent. of the whole number, were practically working people, while in the nationals they numbered 8403, or 54.06 per cent. These include the following classes, as shown in the table: Accountants, bookkeepers, etc.; artisans and mechanics; farmers, gardeners, etc.; housewives and housekeepers; laborers; mill and factory employees; and salesmen and saleswomen. The remainder—that is, 47,840, or 30.04 per cent. in the local associations, and 7144, or 45.94 per cent. in the national associations—consists of agents, bankers, brokers, etc.; corporation officials; government officials and employees; hotel, boarding-house, and restaurant keepers; lodges, churches, and societies; manufacturers, contractors, capitalists, etc.; merchants and dealers; persons engaged in the professions; and superintendents, foremen, etc. These figures show conclusively that the building and loan associations of the country are being used by the classes for which they were originally established. These percentages may well and honestly be applied to all the shareholders in the country, as the facts relative to occupations were taken at random."

Building associations exist also in Europe in considerable numbers, tho not to such an extent as in the United States. (For information in regard to them, see COOPERATIVE BANKS.)

It may seem strange at first sight that there should be any opposition to a movement that has given homes to so many working men, yet such is the fact. Many if not most leaders of trade-unions discourage the policy, under the present system and under ordinary circum-

stances, of the average working man investing in a home. Their argument is that it puts him under the power of his employers, and removes the probability of his being able to obtain any increase in wages. They declare that in Philadelphia in most trades wages are lower than in any other large city of our country, and that Philadelphia is most backward in the organization of labor. They assert that the reason is that in Philadelphia men partly own their houses. Partly owning their houses, they are tied to their circumstances. They can neither move nor strike, for fear of losing their investments. They have to submit to taking what wages they can get. There have been few if any large strikes in Philadelphia. In a strike on the Pennsylvania Railroad, one of the officials of the road is reported to have said: "We are not afraid of the Philadelphia end of the road. Those men cannot strike. They half own their homes." In some factory towns in this country it is the deliberate policy of the management to induce their employees to partly own houses, so that wages may be reduced.

There are, then, two sides to the question of a wage-earner trying to own his house. In the recent hard times, some of those deepest in trouble were the unemployed who had commenced to purchase a home, and were in danger of losing much at least of what they had paid in.

There is another point. To gradually buy a home, the working man has not only to work himself, but to have his wife work away from home, and often to have his children work. The home is thus bought at the cost of having the mother and the children away from the home; a home is obtained by destroying home life.

Such is the trade-unionist's argument. On the other hand, even from their standpoint it may be asked, if a man who has a home owned and paid for, tho he cannot strike for higher wages, is not in a better position from the fact, to contend for a better system, than one where strikes are necessary?

There is in the United States a National League of Local Building and Loan Associations, of which the Hon. Seymour Dexter, of Elmira, N. Y., is president. It is organized in 15 State leagues, and has for its motto, "The American home the safeguard of American liberties." Mr. Dexter calls it "the most successful form of direct cooperation yet evolved; every association the center of an influence stimulating industry, frugality, temperance, home-owning, and good citizenship. It offers a practical way for every family to buy and pay for a home."

Appleton & Co., of New York City, 1889); *Manual for Building and Loan Associations*, by H. S. Rosenthal (published by S. Rosenthal & Co., of Cincinnati, Ohio, 1888); *A Treatise on Building Associations*, by Charles N. Thompson (published by Callaghan & Co. of Chicago; the last-named book is designed especially for the use of lawyers and association officers); *The Working Man's Way to Wealth*, (Philadelphia, Lippincott); *Building and Loan Associations*, the

Ninth Annual Report of the (U. S.) Commissioner of Labor (1893), on application.

BUILDING TRADES, LABOR MOVEMENT IN THE.—The workers in the building trades have been pioneers in the labor movement, especially the ship carpenters. As early as 1642 ships were built in Boston, there being 12 shipyards in that city by 1743. From 1712-20, 700 sail of ship were built in New England. The builders were honored. In 1631, while Richard Hollingsworth was engaged in building a large vessel, one of his workmen was killed, and Hollingsworth was required by the Court of Assizes to pay £10 sterling to the wife and children of the deceased, because they thought that sufficient care was not taken to have his tackle strong enough.

It had been the custom in this industry, as well as in others, to furnish drink or grog at various intervals in the day. In 1817 Thacher Magoun, a ship-builder, determined to abolish the grog privilege. The ceremony of laying the keel, and of commencing each part of the work, as also the christening or naming of a vessel, was always accompanied with the use of ardent spirits. Upon Mr. Magoun giving notice that no liquor could be used in his shipyard, the words "*No Rum! No RUM!*" were written upon nearly every clapboard of the workshop, and on each timber in the yard. Some of the men refused to work, but finally all gave in, and a ship was built without the use of liquor in any form.

The hours of labor at that time were from sunrise to sunset, and all employers were obliged by custom to furnish liquor free at least twice a day. These two periods for drink were really periods of rest, and were called luncheon times, the men having an opportunity to eat as well as drink, and Mr. Magoun's no-rum movement meant no luncheon time, and was in effect an increase in the working time, the employer thus saving the cost of time as well as the cost of the rum.

The ship-workers and building trades not only were among the very first to organize their craft into unions, but they seem to have been the first organized body of working men to bring the hours of labor to a direct issue.

The calkers, from the painful positions of their labor and other causes, were especially prominent in organizing; and from their meetings it is claimed is derived the word "caucus," so common in political affairs.

The New York Society of Journeymen Shipwrights was incorporated April 30, 1803, and the House Carpenters of the City of New York, in 1806. The unions of that time made a stand against the length of the work-day, which was then 14 hours. The employers, in resisting this effort on the part of the workmen, published resolutions regretting the action of the journeymen ship-carpenters, calkers, and others, in maintaining a system of measures designed to coerce individuals of their craft, and to prescribe the time and manner of the labor for which they were liberally paid. They then proceeded to declare their intention to black-list all persons who belonged to the association. In 1850, after many years of contention and defeats, the ten-hour day had extended to the shipyards. Even before then President Van Buren had, in 1833, by proclamation fixed the hours in the navy yards at 10 per day. Upon securing the ten-hour day the agitation for eight hours was begun, and has continued to the present time, with slow, gradual progress toward complete success. In the spring of 1853 there were extensive movements in the building trades toward organiza-

Various Unions.

tion and for an increase of wages; and in 1854 the Boston ship-joiners struck and obtained an eight-hour day. The journeymen house carpenters of Boston and New York held meetings for organization in 1853; and in 1856 the ship-carpenters organized and moved for eight hours. In 1866 the ship-carpenters employed at Greenpoint, L. I., went on strike for eight hours. Their movement culminated in a great demonstration of all working men in New York for eight hours. All these efforts were generally condemned by the press. The Amalgamated Society of Carpenters and Joiners is an English organization, with some 25 branches in the United States. It was founded in June, 1860, and publishes an annual report filled with statistical information for the order and the trade.

Attempts to organize the carpenters of the United States into a national body were made in 1854, in 1867, and at other times. Finally, at a convention held in Chicago, August 8, 1881, the Brotherhood of Carpenters and Joiners was formally organized. (See BROTHERHOOD OF CARPENTERS AND JOINERS.)

The Bricklayers' and Masons' International Union of America was first organized under the name of the International Bricklayers of America, October 16, 1865, at Philadelphia.

Previous to this time unions of a local character were organized and thrived in various cities of the United States. The first annual convention after organization was held at Baltimore, Md., January 8, 1866. John A. White, of Baltimore, was elected president; J. Edward Kirby, of Baltimore, secretary; and Joseph Hackney, of Philadelphia, treasurer. The second annual session was held at Cincinnati, January, 1867. At the seventeenth annual session, in 1883, the present title of the order was adopted. From 1873 to 1880, during the years of depression in business, the order declined until but a small remnant existed; but with the revival of business occurred a revival of the organization, until now it numbers about 33,000 members. The organization is a purely protective one in a national sense, and all of the subordinate unions have benevolent features combined. The local union at Philadelphia has erected a building on North Broad Street, which is an ornament to that city. Other unions have followed this move, until several buildings are owned or controlled by local branches.

The Granite Cutters' National Union had its origin at Clark's Island, Me., January 2, 1877. At first only a temporary organization, it became a permanent body on March 6, 1877. The first meeting of the National Board was held March 10 of the same year. N. C. Bassick was elected president, and Thompson H. Murch, secretary; the latter was afterward elected to congress, defeating Eugene Hale, and J. B. Dyer was elected secretary, and has retained that position up to the present time. The first regular convention of the national body was held at Boston, Mass., February 5, 1878, with representatives of 22 branches present. The first strike was on April 6, 1878, at Vinalhaven. The most notable strike of the organization was at Quincy, Mass., lasting nearly nine months. The great Western, R. I., strike of 1885 was also a protracted struggle, as was the lockout at Ryegate, Vt., 1885. The strike against convict labor on the State capital at Austin, Tex., and the more recent one against Norcross Brothers, of Worcester, Mass., involving operations in various portions of the country, are matters of record. The policy of the organization has been to change the headquarters of the organization every two years. A trade journal is published monthly from the office of the secretary.

The Painters' and Decorators' Union had an early existence in a small way, known as the Painters' Union of Philadelphia, in 1856. In 1859 an effort was made to found a national union, and a convention was called; but after a brief existence the movement perished. In 1871 the New York Operative and Benevolent Union, the oldest union of the trade, undertook the work of forming a national body and formed the Painters' Grand Lodge, which body held four annual conventions. During this time the painters entered into the eight-hour movement, and won the first victory for the shorter hour cause, earning the title of pioneers of the eight-hour movement. The great panic of 1873 caused the collapse of the national organization, and not until March, 1887, were efforts to revive successful. Then the present organization was formed, under the title of the Brotherhood of Painters and Decorators of America. The general president is J. W. McKinney, of Chicago, Ill.; the general secretary and treasurer is J. T. Elliott, Baltimore, Md. From the office of the secretary is issued monthly a paper called the *Painters' Journal*. The order has about 200 unions in all sections of the United States and Canada. A. A. CARLTON.

BUILDING TRADES (English). See TRADE-UNIONS, section "England."

BULLION.—The precious metals gold and silver are generally spoken of as bullion when at or near the standard fineness accepted at the mints of the different countries of the world. Says Palgrave's *Dictionary of Political Economy*: "The term is sometimes applied, with some qualifying epithet, to ores containing only a very small portion of the precious metals, which are called 'doré bullion' or 'base bullion,' etc. A statement in the report of Mr. J. P. Turnbull, director of the United States Mint, on the production of the precious metals in the United States, pp. 14, 15 (1887), will explain this. The reference in it is to certain ores found in Mexico more or less argentiferous, the value of which has been generally estimated in Mexico by the assay of the precious metals, or of silver to the exclusion of the minute proportion of gold contained in the ore; the base metals not entering into the estimated value. The report then refers to 'the small tenor of gold extracted from doré bullion.' The metallic compound is then termed 'doré bullion' or 'base bullion,' according to the proportion of the metals of which it is composed—mainly silver or lead; but the term bullion is properly applicable to the precious metals alone."

BUONARROTI, MICHEL, was born in Pisa in 1761; he early fled to Corsica on account of his revolutionary ideas, and published there his *Friend of Italian Liberty*. In 1792 he came to Paris, and was admitted to the title of "Citoyen Français." For complicity with the conspiracy of Babeuf (*q. v.*) he was condemned to deportation. After much suffering he escaped to Geneva, and later to Brussels, where he wrote his *History of Babeuf's Conspiracy* (1828). In 1830 he returned to France, and secretly worked for communism, exerting much influence upon Blanqui and other leaders. He died in 1837.

BUREAUS OF LABOR. See LABOR BUREAUS.

BURIAL SOCIETIES are friendly societies, found mainly in England, constituted in the usual manner, but with the express object of supplying a fund for paying the funeral expenses of the members on their death. (See FRIENDLY SOCIETIES.) It became customary to enter the names not only of adults, but of children, in such societies. The proceedings of the criminal courts have shown that, in some instances, children on whose lives such an insurance was effected have been killed or allowed to die of neglect, and the alarm created by such instances was enhanced by the discovery that children were frequently insured in more than one society. Legislation in England was enacted to remedy this. In this country burial societies have had little development, their place having been filled by provisions embodied in the various friendly societies, secret orders, or trade organizations.

BÜRKLİ, KARL, was born at Zurich in 1823. He became a tanner, and was converted to so-

cialism (1845) by the writings of Fourier; he founded the first *Konsumverein* in German Switzerland, and in 1851 was elected to the Cantonal Council because of his socialist program, and advocacy, for the first time in Switzerland, of direct legislation. Since then he has played an important part in Swiss politics as a firm socialist. In his seventieth year he opened the Zurich International Congress. He has been a voluminous writer from 1851-91.

BURNS, JOHN, was born at Battersea, London, in 1858, being the son of an engineer who formerly came from Ayrshire. He began to earn his own living at the age of 10, working in a candle factory. Later he was apprenticed to a local engineering firm. Burns became, while young, a diligent student of trade-unionism. He was arrested in 1877 for persistently speaking on Clapham Common. When out of his time in 1879 he joined the Amalgamated Society of Engineers, and prominently advocated shorter hours. In 1880-81 he was engaged as an engineer in West Africa, and read Adam Smith and J. S. Mill. In 1883 he became a socialist, and joined the Social Democratic Federation, and became its leading working-class member. In 1885 he stood as socialist candidate for Nottingham, and received 598 votes. For two years he led the "unemployed" agitation in London. In 1886 he was arrested with Hyndman and others for speaking in Hyde Park, and on acquittal his speech (*The Man with the Red Flag*) was printed and widely sold. In 1887 he was imprisoned six weeks for breaking through the police, and speaking in Trafalgar Square (November 13), "Bloody Sunday." In 1889 he was elected to the London County Council from Battersea. The same year he showed marvelous skill in managing the Dock Strike, and in organizing the unorganized, and became the foremost leader of the "new unionism." Believing in the "progressivist" policy of advancing socialism through any party, he left the Social Democratic Federation, and has been much criticised by its leaders ever since. At the general election in 1892 he was easily elected M.P. for Battersea, and in 1893, receiving the highest number of votes at the Trade-Union Congress, became Chairman of the Parliamentary Committee.

On the London County Council his work has been continuously good and increasingly onerous. From the reactionary Metropolitan Board to the present progressive council there is a far cry, and Burns has had a large share in its onward march. The attitude of its Works Committee, with fair wages, hours, and conditions of labor, and its system of direct employment without contractors, is worth recording. In Parliament, too, his work has been none the less solid: witness the adoption of the eight-hour day in government workshops, and his interest in all reforms. As a trade-unionist he is a trusted man, vice-chairman of the Parliamentary Committee of the Trade Union Congress, and visited the United States with D. Holmes December, 1894, as English representatives to the convention of the American Federation of Labor.

The platform upon which Burns was elected to Parliament, more advanced than that of any

other member, indicates his political belief. It is as follows:

"The recent movements of labor, the popular demand for more leisure and a higher standard of life, the determination to use Parliament for a social end, and not as an appanage of vested interests, will find in me an earnest advocate.

"As a Social Democrat, I believe that nothing short of the nationalization of the land, railways, mines, and the means of production will permanently remove the poverty and inequalities which surround us, and that eventually society will accept that view. Till that is completely realized—and it is being fast accomplished—Parliament can be made the means of giving to the people those legislative, municipal, and decentralized powers by which poverty can be reduced, burdens lightened, and the community immeasurably benefited.

"As a candidate, dealing with immediate questions and asking your votes, I am in favor of the following:

"Home Rule for Ireland, and such measures of legislative independence as the Irish people may demand for their political, social, and industrial emancipation.

"Payment of members and election expenses. **His Platform.**

"Adult man and woman's suffrage, and drastic amendment of registration laws, second ballot, and referendum.

"Triennial Parliaments.

"Abolition of the House of Lords and all hereditary authorities.

"Conferring upon the London County Council all the powers enjoyed by other municipalities and giving to London a unification of complete municipal self-government, with power to acquire all existing monopolies.

"District and parish councils, with full and popular powers.

"Alteration of the incidence of taxation, so that the ground landlord, the owner, and the rich shall pay their just proportion of taxation.

"Disestablishment of the Church.

"The legal eight-hour day as the best means of securing work for all, overwork for none, the avoidance of strikes, reduction of the rates, and giving permanent employment where demoralizing casual labor now prevails.

"Raising the age of child labor, and placing all trades within the scope of existing and future factory and sanitary acts.

"Alteration of existing poor law, and diversion of its funds to some scheme of old-age pensions that, by cumulative or graduated income tax on the rich, would give sustenance to old people, without pauperization.

"Giving to localities absolute and complete power in deciding upon all questions relating to the drink traffic by direct veto and local option.

"The recognition of trades-unions, the abolition of sweating and sub-letting, the payment of union wages in all government departments, and the checking of waste, jobbery, and extravagance wherever found.

"Beyond the above, I will attend to all local matters before Parliament, and will always endeavor to make the district in which I have lived my whole life respected where it is not feared, and will ever have in view the best and most permanent interests of the community."

Burns has done an important and interesting work in Battersea, his native parish, which has a population of 160,000, 90 per cent. of whom belong to the industrial and laboring classes. But for him the municipal progress of the parish would not have taken place. Since 1887, when it was given full administrative powers, Battersea has established:

1. A splendid public library—supported out of the rates—with two branches, bringing free reading to the doors of all its people. The libraries are open on Sundays.

2. Public baths and wash-houses, where people may have baths of all kinds at a very moderate charge, including the largest swimming bath in London, and where the poor housewife

can use all the most improved machinery for washing.

3. New municipal buildings, with a town hall capable of holding 1500 people.

4. A polytechnic institute, a real people's university, and the best of its kind in equipment in London.

Battersea has abolished contractors, and constructs its own works under the conduct of the Works Department. The men employed by the municipality have an eight-hour day, and are paid trade-union wages. These and other practical reforms have had the steady advocacy of Burns.

Besides being trustee to several trade-unions, Burns is governor of the Battersea Polytechnic. An authority on labor problems, he is constantly consulted on industrial questions. Much of his tremendous energy, of his cheery optimism, and of his remarkable success is due to the inspiring influence of his wife, unseen, yet felt by thousands.

In 1894 he made a lecturing tour in the United States. In 1895 he was returned again to Parliament, though with a greatly reduced vote.

BURROWS, HERBERT, was born in Suffolk, England, in 1845. The son of a Methodist local preacher, he studied at a private school and

entered the civil service. He was one of the original founders of the Social Democratic Federation, and is still a member. He gave himself so energetically to the cause as on occasions to deliver seven addresses a day. He was one of the organizers of the dock laborers, and has represented the federation in several socialist congresses. He is now in the civil service, and deeply interested in theosophy, but still true to socialism. He is (1895) treasurer for the Match Girls' Union, and active on its behalf.

BURT, THOMAS, was born in 1837; the son of a miner. Following his father's profession, he became Secretary of the Northumberland Miners' Union in 1865. In 1872 he was elected to Parliament from Morpeth, with Alexander Macdonald, the first "labor member" to sit in Parliament. He has represented Morpeth ever since. He was President of the Trade-Union Congress in 1891. He has served on several commissions, boards of trade, and in politics is a Liberal.

BUSINESS FAILURES.—The following are the business failures in the United States in recent years. For earlier years in the United States and for statistics for England, see BANKRUPTCIES.

BUSINESS FAILURES IN THE UNITED STATES FROM 1886-1891, AS REPORTED BY BRAD-STREET'S.

YEARS.	Number.	Actual Assets.	Liabilities.	Per cent. Assets to Liabilities	YEARS.	Number.	Actual Assets.	Liabilities.	Per cent. Assets to Liabilities

* Wanting all returns for the latter part of December. The returns yet to be received will probably add about 700 to the number of commercial failures, and about \$5,000,000 to the aggregate of liabilities. While the number was but little smaller in 1894 than in 1893, the aggregate of liabilities was not half as large. In the aggregate of liabilities, failures of banks and financial institutions are not included, and the total for the year thus far reported is shown by sections in the following table:

BANK FAILURES.

BUTLER, BENJAMIN F. (1818-93), was born at Deerfield, N. H. He graduated at Water-ville College, Maine; studied law at Lowell, Mass., and was admitted to the bar in 1841. He soon became distinguished as a criminal lawyer and Democratic politician. In 1853 he was elected to the Legislature, and in 1859 to the State Senate. Having become a brigadier-general of militia, at the outbreak of the Civil War he marched at once to the South with the Eighth Massachusetts Brigade. In February, 1862, he commanded the military forces sent from Boston to the mouth of the Mississippi, and for seven months held military command of New Orleans. His administration here has been violently denounced, and it brought down upon him the intense hatred of the Southern people, because, altho he maintained order and enforced sanitary regulations, he compelled the rich secessionists to relieve the wants of those whom their rebellion had impoverished. When relieved of his command he was moved north to

Virginia and North Carolina, and cooperated with General Grant in his movement upon Petersburg. In 1866 he was chosen member of Congress from the Boston district, and two years later was one of the managers in the impeachment of President Johnson. From the commencement of the rebellion Butler had been a Republican; but as soon as the Greenback and Labor movement began he fell in with it, and in 1878 he was the candidate of this movement for Governor of Massachusetts. He received 109,435 votes as against 134,725 for the Republican candidate. In 1879 he was again defeated; but in 1882 was successful as the Democratic nominee. Two years afterward he was the presidential candidate of the Greenback-Labor and Antimonopoly parties, receiving about 133,000 popular and no electoral votes.

Altho very wealthy, General Butler kept near to the heart of the "common people," and few men of his time had as large a following among the working men, especially in Massachusetts.

CABET, ÉTIENNE, was born at Dijon, France, in 1788, and died at St. Louis (U. S. A.), in 1856. The son of poor parents, he received little education, but worked his way up by attending the lectures of his distinguished fellow-townsmen, Jacotot, till he became a teacher in the *Lycée*. Later he studied both law and medicine. In 1815 he became founder and director of the "Fédération Bourguignonne" for the defense of the national territory, and became connected with the Carbonari, his father before him having been a fiery patriot. About 1820 he went to Paris, and the Revolution of 1830 found him in the first line of its adherents. Up to 1839 he followed the varying fortunes of a Parisian extreme republican, writing various histories of the French revolutions and defending the most extreme acts of the "Mountain." Being tried for this and condemned, he fled to England. Here he read Moore's *Utopia*, and devoted henceforth his life to the cause of communism. He wrote in London and published in Paris in 1840 his *Voyage en Icarie*, an at-

tractive communistic romance. In this he proposed, first, a transitional period of 50 years, and then a complete communism. In the transitional period taxation was to be more and more levied upon the wealthy, and gifts and transfers of property to be severely scrutinized. Wages somewhat favorable to the poor were to be fixed by law. Five hundred million francs were to be spent in providing work and dwellings for the poor. The army was to be disbanded as rapidly as possible, and employed on public works. Under Cabet's full communism, all over 65 were to be retired from work on an allowance. All others able to work were to be set to compulsory work—men from 18 to 65, women from 17 to 50. Everything, however, was to be done to make the work attractive. The family was to be maintained intact, save that at the age of five years children were to be educated in communism by the State. There was to be one official journal; none others were to be allowed. The city of Icaria is described with minute detail, and all arrangements provided for.

The publication of these thoughts in the *Populaire* created great interest, and it was decided to establish an Icaria in America. Cabet bought 1,000,000 acres of land in Texas, and sent, in 1848, 69 trusted followers to prepare the way. Arriving in New Orleans in March, they heard of the republican revolution in Paris, and debated whether or not to return to France. They decided to go on; but their ranks were soon decimated by fever, and they returned to New Orleans, where they met Cabet, who had left Paris in December. There was a stormy interview, and Cabet was much denounced; but in March, 1849, Cabet, with 280 followers, went to Nauvoo, Ill., where they hoped for a better climate than in Texas. Meanwhile, Cabet had been condemned in Paris to imprisonment on a trumped-up charge of fraud. He returned to Paris, and had the sentence reversed. Returning to Nauvoo, he found the community prospering, having, in 1855, 500 members. There was, however, continual dissension, and Cabet with 200 followers left and went to St. Louis, where he soon died. The colony, however, survived, and has only finally disbanded this year (1895). (For the history of the colony after Cabet's death, see ICARIA.) Cabet, it should be added, gave a somewhat religious cast to his thought, writing a book, *Le Vrai Christianisme suivant Jesus Christ*, and indeed several other books arguing that Christianity is communism.

References: *Icaria*, by Albert Shaw; *French and German Socialism*, by R. T. Ely, and other histories of Socialism. (See COMMUNISM.)

CAIRNES, JOHN ELLIOT (1823-75), the son of a large brewer, was born at Castle Bellingham, County Louth. He graduated at Trinity College, Dublin, and was called to the Irish bar in 1857, but never seems to have practised. In 1856 he competed successfully for the Whately professorship of Political Economy in Dublin, and held it for five years, the full period during which it was tenable. During this period he published several essays and lectures, especially one on *The Slave Power*, defending the cause of the North in the American Civil War, and winning by it a high reputation for his economic thought and analysis. In 1865 he moved near London, and was soon appointed Professor of Political Economy at University College, London. Altho at this time a confirmed invalid, he fulfilled his duties with great fortitude and nobility of character. In 1872 his health compelled him to resign, and he was made professor emeritus. In 1873 he published his *Political Essays*, and in 1874 his greatest work, *Some Leading Principles of Political Economy Newly Expounded*. Of the Ricardo-Mill school, Cairnes ranks perhaps second to Mill himself. His work, says Palgrave's *Dictionary of Political Economy*, belongs to three departments: the logic of political economy, the investigation and interpretation of contemporaneous economic facts, and the economic theory. Under the first head he maintains sharply that political economy has to do only with what is, not with what ought to be; and his whole treatment is conservative and of the old, orthodox and a *priori* school, having little to do with the induction

of the historical school. While of the school of Mill, he criticises him very sharply on many points, so that the *Dictionary of Political Economy* declares the effect of Cairnes' last and greatest book to have been mainly destructive in shaking faith in the finality of Mill's conclusions. Cairnes' literary skill and his logical ingenuity are perhaps his most marked characteristics.

CALVIN, JEAN (1509-64).—The great theologian is considered here only from the standpoint of his influence upon social reform, but this was not slight both for good and for evil. Professor John Fiske says of him (*The Beginnings of New England*, p. 58): "It is not easy to speak of Calvin with enthusiasm, as it comes natural to speak of the genial, whole-souled, many-sided, mirth and song-loving Luther. Nevertheless it would be hard to overestimate the debt which mankind owes to Calvin. The spiritual father of Coligny, of William the Silent, and of Cromwell must occupy a foremost rank among the champions of modern democracy. Perhaps not one of the mediæval popes was more despotic in temper than Calvin; but it is not the less true that the promulgation of his theology was one of the longest steps that mankind has taken toward personal freedom. Calvinism left the individual man alone in the presence of his God. . . . In the presence of the awful responsibility of life all distinctions of rank and fortune vanished; prince and pauper were alike the helpless creatures of Jehovah, and suppliants for His grace."

It is easy to see from this in what direction Calvin's contribution to human thought and life must lie. By crushing the individual under the sovereign decrees of God, he frees him from all lesser bondage. Calvin's sociology becomes intensely individualistic. He defends private property as morally necessary, as tests of justice and integrity. The communism of the New Testament he tries to prove was not communism. He is the first theologian to defend interest. The State and the Church he regarded as wholly independent, yet alike in Church and State the one supreme ruler is God. Luxury he condemned as sin. He considered it the duty of the Church to provide for the poor, and to this end he revived the temporal duty of the diocese.

CAMERALISTIC SCIENCE.—The phrase *cameralistic science* has its origin in the fact that, in Europe generally, the king's chamberlain, or *camerarius*, was responsible for devising the ways and means of raising revenue for the public treasury, so that the science of conducting the national revenues and expenditure came to be called the cameralistic science. The phrase has been chiefly used and the science was first carefully developed in Germany, under the name, *Kameralwissenschaft*. Cossa considers Johann Heinrich Justi, who died in 1771, and who was professor first at Vienna, and later at Göttingen, the leader of the German cameralists. Frederick William I., himself an able cameralist and author of the Prussian financial system, did much for the science, founding chairs of political economy and cameralistic

science at Halle and Frankfort-on-the-Oder. The cameralists, speaking generally, took up the principles of the mercantilists (*q.v.*) and developed them into a system of practical finance. The science was also somewhat developed, and chairs of cameralistic science were founded in Italy, France, Sweden, etc.

CAMPANELLA, TOMMASO (1568-1639), was an Italian monk and the author of *Civitas Solis*. He entered the Dominican Order when quite a boy, but devoted much of his time to the study of philosophy. In 1599 there arose a conspiracy in Calabria against the Spanish rule. Campanella, as an Italian patriot, was seized and charged with conspiracy and heresy, for which he was imprisoned in a dungeon in Naples for nearly 27 years, repeatedly being tortured to make him confess his heresy, but with no avail. During his confinement he wrote several works, one of which was his *Civitas Solis* (published 1623). When released he retired to Rome, and afterward to Paris, where, enjoying the friendship of Richelieu and a pension from the king, he ended his days in peace. His book, the *City of the Sun*, is in the form of a dialogue between a Knight Templar and a sea captain. The captain tells of a wonderful city he had visited, and describes minutely all that he saw there, especially the methods of education and the laws by which the city is governed. It much resembles Plato's *Republic*. Work is common to all, but the hours are to be only four, and slavery is repudiated. There is to be community of wives and of goods. Money is not to be received, even from foreigners. A translation of the *City of the Sun* may be found in Morley's Universal Library.

CAMPBELL, HELEN, née STUART, was born in Lockport, N. Y., July 4th, 1839. She attended school at Warren, R. I., and at Bloomfield, N. J. In 1859 she was married to Mr. Weeks, an army surgeon. She began to contribute sketches to the magazines and newspapers at an early age, and gave much attention to housekeeping on a basis of scientific common sense. She has studied carefully the problem of the poor in great cities and elsewhere, and has contributed valuable papers, drawn from personal experience, to current publications. Her novels are all written in an earnest spirit, but are full of touches of wit and pathos. From 1881-84 she was literary editor of *The Continent* (Philadelphia.) Among her published works are: *The Ainslee Series* (New York, 1864-67); *His Grandmothers* (1877); *Six Sinners* (1878); *Unto the Third and Fourth Generation* (1880); *The Easiest Way in Housekeeping and Cooking* (1881); *The Problem of the Poor* (1882); *The American Girl's Handbook of Work and Play* (1883); *Under Green Apple Boughs* (1883); *The What-to-do Club* (Boston, 1884); *Mrs. Herndon's Income* (1885); *Miss Melinda's Opportunity* (1886). Her chief books bearing directly on social reforms are *Prisoners of Poverty, Prisoners of Poverty Abroad, Woman on a Wage Earners* (1893).

CANALS are artificial waterways for the purposes of navigation or irrigation. (For an account of the latter, see IRRIGATION.) Naviga-

ble canals may be divided into those used for inland navigation and those used for shortening sea voyages. With a long and honorable history canals have for the last 50 years been overshadowed in importance by the railway, but are now experiencing a deserved and needed revival.

Altho known in Egypt and China from early days, canals were of small use till the invention of locks in Italy in the fourteenth century. The modern era of canal construction dates, however, from the success of the Duke of Bridgewater's Canal, from Worsley to Manchester, commenced in 1759, and lengthened to Liverpool in 1772. A canal mania at this time broke out. Dividends in some of the canal companies amounted to 100 per cent. In 1817 the Erie Canal in the United States was commenced, and finished amid great enthusiasm in 1825. The original cost was \$5,700,000. In 1852-53, altho the tolls had been reduced to about one third the original amount, the revenue was over \$3,000,000 per year. Up to 1880 nearly 4500 miles of canals had been constructed. The Erie is by far the largest canal in the world, of great importance, having with its feeders 350 miles; tho the Grand Canal in China has some 800 miles, and the improved Ganges River in India 522 miles. The Suez Canal, opened in 1869, has 90 miles of length, with the largest sectional area and undoubtedly the greatest commercial importance of any canal in the world. The Ohio Canal with its feeders has 328 miles, the Miami and Erie, 285; the Illinois and Michigan, 102; the Chesapeake and Ohio, 180, and the Morris Canal, 103. In 1825 the railway era commenced, and the interest in canals diminished. By an unfortunate policy the railroads chose to compete with the canals, instead of leaving to canals the heavy commodities, which the canals could carry better, and pushing into channels of trade which the canals could not enter. The railways have thus not undertaken what they might do with better profit, and have been burdened with work of small profit which the canals needed. Since 1870, however, thinkers have come to see that the canal has a needed place in commerce.

In October, 1884, an International Inland Navigation Congress was held in Bremen, and has met nearly every year since. The great Manchester Ship Canal, which enables the largest steamers for India or America to load at Manchester, was commenced in 1885, and opened January 1, 1894, costing \$75,000,000. It is mainly controlled by the city, which has a majority of the directors. The North Sea Baltic Canal was commenced in 1887, and finished in July, 1895. A canal has been constructed across the Isthmus of Corinth. Canals are also being constructed through Cape Cod, in Nicaragua, and other places. The importance of the last-named canal entitles it to a treatment by itself. (See NICARAGUA.)

A proposal to pierce the Isthmus of Darien was made as early as 1520 by Angel Saavedra; Cortez caused the Isthmus of Tehuantepec to be surveyed for the construction of a canal; and in 1550 Antonio Galvão suggested four different routes for such a scheme, one of them being across the Isthmus of Panama. In 1879 M. de Lesseps took the matter up, and the first meeting of his company was held in 1881. The capital necessary for the "Company of the Inter-oceanic Canal of Panama," as it is called, was stated at 600,000,000 frs.—the estimated cost of excavation being 430,000,000 frs., that of weirs and trenches to take fresh water to the sea, 46,000,000 frs., and that of a dock and tide-gates on the Pacific side, 36,000,000 frs. The Panama Canal was bought for \$20,000,000. The contractors, Couvreur & Hersent, began operations in October of the same year. (See PANAMA.)

Projected canals will probably in the future connect, in Europe, the Bay of Biscay with the Mediterranean, the North Sea with the Mediterranean, the Baltic with the Black Sea; Paris, Brussels, and other cities with the sea, and cross England, Scotland, Ireland, Italy, and other countries. In America canals are projected which, commencing with the Cape Cod Canal, will give unbroken

**Projected
Canals.**

inland communication from Boston to the Carolina sounds, will cross Florida and Upper Michigan, will connect Lake Michigan with the Mississippi and Pittsburg with Lake Erie. Even to-day canals are of vastly more commercial importance than many realize. Mr. Marshall Stevens, in a recent paper before the British Association for the Advancement of Science, showed that more fine goods are carried to-day between Manchester and Liverpool on the Bridgewater Canal than on any of the three competing roads, even tho the rates are the same. The tonnage on the Trent and Mersey Canal is over 1,250,000 tons per year. In France the canal tonnage is nearly 20,000,000 tons per year; in Germany water carries 40,000,000. The Erie Canal, altho the political influence of the railroads has allowed it to be neglected and unimproved, as late as 1884 carried half as much grain to New York City as all the roads combined, altho it is closed for five months in the year. Mr. Albert Fink, one of the ablest railroad managers in the United States, has testified to the far-reaching influence of the Erie Canal in affecting general railroad rates through the country, so that railroad rates are reduced generally when the Erie Canal is open. In 1839 the value of the traffic passing through the St. Mary's Falls Canal, between Lakes Superior and Huron, was \$83,733,527. The total tonnage of all canals in the United States, even in 1880, was over 20,000,000. The total tonnage of the foreign trade entering New York City in American or foreign vessels in 1887 was only 84 per cent. of that passing from Lake Huron to Lake Superior. The Illinois and Michigan Canal is at present little more than a ditch, yet from 1880 to 1885 it transported 5,000,000 tons.

Canals are of importance, first, because they can carry certain freight cheaper and better than railroads; secondly, because by carrying goods where speed of transport is of small moment, they can free the railroads to do more rapid work; thirdly, because they develop trade, and so aid and not hurt railroad traffic. Ship canals connecting Lake Ontario with the ocean, and the Great Lakes with the Mississippi, will make Chicago a seaport, and develop a trade greater than that of the Suez Canal.

Realizing their importance, it is evident that the railroads should be allowed no longer, through a mistaken policy, to ruin canals, often buying them up and perhaps running their tracks in the canal bed. Many hold that Government should care for, own and operate the canals on some large, comprehensive system. Every argument for the nationalization of railroads applies to canals only with added force. (See RAILROADS.) For the literature of canals in their economic aspect, see *The Canal and the Railway*, by E. J. James, Ph.D., a publication of the American Economic Association for 1890; also *Waterways and Water Transport*, by J. S. Jeans, London, 1890.)

CANON LAW.—Rules or laws relating to faith, morals or discipline for the members of a church, enjoined by its ecclesiastical authority; specifically a collection of rules of ecclesiastical order and discipline embodied in the Corpus Juris Canonici (body of canon law). This is a compilation from the canons of councils, the decrees of popes and the decretals and canonical replies made to questions put at various times to the Roman pontiffs or the fathers of the Church, together with commentaries or glosses. There were various compilations of such laws from the third century down to the twelfth, when they were gathered into something like their present shape by Gratian, a monk of Bologna, in 1151, since when they have been added to but not materially changed. They mainly consist to-day of the Decretum, or compilation of Gratian, the decretals of Gregory IX., those of

Boniface VIII., the Clementine constitutions, and the books called the *Extravagantes* of John XXII. and the *Extravagantes Communes*.

We consider here briefly only such points of the canon law as bear on economic reform. At the beginning of canon law we are told that men are under two kinds of laws—the law of nature and the law of custom or positive institution (*naturalis juris et moribus*). Civil law and canon law are two branches of the second kind. Private property, we are told, is not known to the law of nature, but all things are common to all men, as they were among the first disciples. St. Augustine argues that, as “the earth is the Lord’s, and the fulness thereof,” private property is not of divine, but of human government. Yet canon law does not wholly forbid private property. It forbids it to the clergy, but allows it somewhat grudgingly to the laity. The clergy are to hold property collectively for the good of the poor; they are not to marry, and are to be content with food and clothing. The laity are to hold property only in trust for the poor, and to give liberally to them, and to the clergy as almoners for the poor. It is at least hinted that even for the laity community of goods is better, and that property is only allowed for the hardness of men’s hearts. Agriculture is the ideal industry, and the only right way to increase wealth is to till the ground and breed cattle. These pursuits and the simple manufacturing industries are allowed even to the clergy. Labor within these limits is commended, if not commanded, and it is the glory of canon law that it did its best to enfranchise the laborer. Canon law is largely drawn from, or at least molded by, Roman law, the Decretum itself being modeled after the pandects of Justinian; yet Roman law cared much more for property than for men, the canon law much more for men than property. Usury—and by usury canon law means use money or interest of any kind and at any rate—is strictly forbidden as sin. Only very gradually and covertly did exceptions to this rule begin to creep in, and not till the creation of the “Montes Pietatis” (*q. v.*), in the fifteenth century, was usury to any extent condoned. (For a fuller treatment of the relation of usury to Christian thought, see USURY.)

Canon law never obtained a firm footing in England, tho there was a kind of national canon law composed of canons passed in national and provincial synods, and foreign canons by custom and common law. In the reign of Henry VIII. Parliament enacted that a review should be made of the canon law, and that till it was made all canons, constitutions, ordinances, and synodals provincial, already made and not contrary to the law of the land or the king’s prerogative, should still be used and executed. As no such review has ever been perfected, canons enacted before this date are within the above limitations still held by many to be binding to-day in England upon both clergy and laity. Later canons of the Church of England, however, are a different matter, and concern only the Church of England. Through all civilized countries the influence of the canon law has been great, creating, if nothing more, at least a high norm of righteous living. It is desired by some that Church councils to-day should pass, if not canons, at least decisions as to what it regards as the true ways of life for Christian men.

CANONS OF TAXATION. See TAXATION.

CANTILLON, RICHARD, a writer of Irish race, living in Paris in the first half of the eighteenth century, of whose life little is known, but whose little book, *Essai sur la nature du commerce en général*, the earliest edition of which was published in Paris in 1755, seems to have exerted a very profound influence upon the economic thought of his century. For what is known of his life, see article “Cantillon” in Palgrave’s *Dictionary of Political Economy*. Cantillon’s opinions were those of the mercantilist school modified by the ideas of the Physiocrats, and all stated with unusual scientific precision and method. For a very favorable estimate of his work, see the article by Jevons upon “Richard Cantillon and the Nationality of Political Economy,” in the *Contemporary Review*, 1881. (See POLITICAL ECONOMY.)

CAPITAL may be briefly but correctly defined as "that part of wealth which is devoted to obtaining further wealth" (Alfred Marshall, *Economics of Industry*, p. 5). Says J. S. Mill (*Political Economy*, i., iv., Sec. 1): "What capital does for production is to afford the shelter, protection, tools, and materials which the work requires, and to feed and otherwise maintain the laborers during the process. Whatever things are destined for this use, destined to supply productive labor with these various prerequisites, are capital." Knies defines capital as "wealth set aside

Definitions.

for the satisfaction, directly or indirectly, of future needs. This satisfaction may be obtained by the individual by lending his wealth at 'usury'—usury of money, usury of victuals, usury of anything that is lent upon usury, or by reserving means for future production, as in the case of the husbandman and his corn or cattle, or by laying up for himself a treasure which will be a delight for many days." President Francis A. Walker (*Political Economy*, Sec. 73) defines capital as "that part of wealth, excluding unimproved land and natural agents, which is devoted to the production of wealth." E. V. Böhm-Bawerk defines capital as "the complex of goods that originate in a previous process of production, and are destined, not for immediate consumption, but to serve as means of acquiring further goods. Objects of immediate consumption, then, and land (as not produced) stand outside our conception of capital."

There are three principal questions in defining capital which we need to answer: (1) *Is all capital the result of labor, and ought we to exclude the forces and free gifts of nature?* To this we must answer that it is largely a matter of convenience how we use the term, and, in a general way, capital may be said to include such free gifts of nature; yet, as usually in political economy, it becomes necessary to distinguish between the free gifts of nature and the produced works of man, it is probably best with the above authors not to include under the term capital any of the so-called free gifts of nature. Of course it is not always easy to draw the line, as in the case of made land, between the free gifts of nature and the work of man, and yet, altho in some cases the line may be invisible, and therefore hard to place, there is a line, and an important line, and usually at least it can, approximately, be placed. Certain improvements put upon land in time become a part of the land itself. No definition can cover all the exigencies of life, but the general distinction is plain and convenient. Another question is, (2) *Does the distinction between capital and non-capital depend on the intention of the capitalist, or, in other words, the owner of the potential capital?* Thus Professor Marshall, in the *Economics of Industry*, argues that a doctor's carriage, when used on professional visits, would be capital, but when used for pleasure merely would not be capital.

To this it may be answered that the distinction lies not so much in the intent as in the use that actually is made; though of course usually what is intended for production of wealth is used for that purpose, so that the same article

may sometimes be used as capital and sometimes not. The final question is, (3) *Does capital include what are called immaterial, as distinct from material qualities?* This question is somewhat similar to the first. In a general sense immaterial qualities are certainly often, and perhaps usually, the truest capital. Thus we say a man's capital is his health, skill, strength; but in political economy it is usually and probably wisest to not call this capital, because it is different from material capital, and obeys different laws, and therefore should be distinguished from it. Capital, therefore, is probably wisely, and at least as a matter of fact, usually used in political economy in the restricted sense of *material wealth, not the free gift of nature, used for the production of more wealth.*

We now come to consider some different kinds of capital, and first the common distinction made between Circulating and Fixed Capital.

"Capital which fulfils the whole of its office, in the production in which it is engaged, by a single use, is called *Circulating Capital*."

"Capital which exists in any durable shape, and the return to which is spread over a period of corresponding duration, is called *Fixed Capital*."*

In this distinction all economists are agreed. Another convenient distinction is made by Professor Marshall (*Economics of Industry*, p. 19) into *Remuneratory Capital* and *Auxiliary Capital*. He says:

"*Remuneratory Capital* or *Wage Capital* consists of the food, clothes, shelter, etc., which support labor.

"*Auxiliary Capital* is that which aids labor. It consists of tools, machines, factories and other buildings that are used for trade purposes, railways, canals, roads, ships, etc.; also raw materials."

Passing now to the theory of capital, we are met at once by the utmost diversity of opinion, and have therefore to consider the history of theories of capital.

The word capital (connected with the Latin *caput*, or head) was originally a mere adjective in the phrase, "capital stock," and so used as late as

Adam Smith. But it soon came to be used elliptically for the whole phrase, and the single word capital is used in the modern sense at least as early as 1625, in Dafforne's *Merchant's Mirror*. This gives us some clew to the history of the treatment of capital by economists.

It has been mainly connected with interest, the phrase "capital stock" being contrasted with the interest accruing from it. At first, in society, there was very little capital. Men made their little modicums of wealth directly from the soil by rude agriculture, hunting, and fishing, all requiring the least amounts of capital. As invention grew, however, more and more were machinery and implements of toil a necessity to successful production. This necessitated capital, either in the form of machinery or money, to enable the owner to obtain machinery. We can now see why the modern age is distinctively the capitalist age, and why, till now, comparatively speaking, capital can scarcely be said to have existed. The modern age is the age of machinery. The inventions of the last part of the eighteenth century created an "industrial revolution." Machinery on a large scale became the necessity of successful trade; in other words, capital and the capitalist gained the key to the situation. The man without capital became dependent on the man with capital. When, in 1776, Watts perfected his steam-engine, the capitalist age was fully born.

It is not strange, therefore, that the careful study of capital belongs to modern times. Until the present age it did not assume importance enough to elicit study. Since 1776 all schools of political economy may be distinguished by their treatment of capital.

The best statement yet written of the various theories of capital is undoubtedly Böhm-Bawerk's in his *Capital and Interest: A Critical History of Economic Theory*, a translation from the German *Kapital und Kapitalzins*. This book we shall largely use in the following account. The problem of capital Böhm-Bawerk states substantially as follows:

Different Kinds of Capital.

History of Theories of Capital.

* Mill, Book I., chap. vi.

He who owns capital can generally obtain from it a permanent net income called interest. This has notable characteristics. It owes its existence to no personal activity of the capitalist. It flows into him even where he has not moved a finger.

The Problem of Capital.

It seems in a peculiar sense to spring from capital, or, to use a very old metaphor, to be begotten of it. It may be obtained from any capital, from goods that are barren, as well as those that are fruitful; from perishable goods, as from durable; from goods that can be replaced, and from goods that cannot be replaced; from money, as from commodities. Finally, it flows into the capitalist without ever exhausting the capital from which it comes, and therefore without any necessary limit. It presents the remarkable picture of a lifeless thing producing an everlasting and inexhaustible supply of goods. Whence and why this endless flow of wealth? This is the theoretical problem of capital and interest. This is different, says Böhm-Bawerk, from the social and political problem. The theoretical problem asks why there *is* interest on capital; the social and political problem asks whether there *should* be. Yet it is doubtful if we can keep the two questions apart. "Whether there should be" certainly depends upon "why there is," and "why there is" is not unaffected by "whether there should be." Yet they are two questions, and for the sake of clear thought we should try to keep them separate, and to answer the first question first. Yet, historically, in political economy, the second question received the first treatment. Ancient political economy evidenced a deep disapproval of interest, as witnessed in the prohibition of interest between Jews in the Mosaic code and in many passages from classic literature. (See USURY.) The reason is not far to seek. Credit had little place in production. Machinery was simple. Almost all loans were for immediate consumption, and, as a rule, to people in distress. The creditor was usually rich, the debtor poor, and the former, therefore, in the light of a man squeezing something from the poor man. Yet was there little study of the question. Plato, Aristotle, the two Catos, Cicero, Seneca, Plautus—all condemn interest, and yet assign little reason for so doing. Aristotle's argument was: Money is by nature incapable of bearing fruit. The lender's gain, therefore, must come from a defrauding of the borrower. The strong condemnation of interest by the Mosaic law and the early Christian Church is well known. Yet there was usually but little reason given, and some of the reasons that were given are far more rhetorical than logical. Gradually Greek and then Roman legislation came to allow interest, and so the practice spread. The Middle Ages, however, witnessed a revival of the condemnation of interest. The Church strenuously condemned it (see CANON LAW), first categorically, and then, as the desire for interest and the seeming need of interest increased, with more show of argument and attempt at reason. Gonzalez Tellez falls back on Aristotle's argument.

Thomas Aquinas (*q.v.*) does the same in a different form. He argues that he who loans money passes over money and all that comes from it, and therefore has no right to the interest that springs from it. Interest again he considers as the hypocritical and underhand price asked for a good common to all-time. Time is simply a pretext used by usurers to get more than they give. But time is a common good, given to all equally by God. This was the general position of the canonists, tho steadily and quietly exceptions and excuses were introduced permitting interest under this pretext or that.

The Protestant reformers usually approved of interest, altho with more or less reserve; at least this is so with Zwingli, Luther (in his later days), Melancthon, and Calvin. The last named, however, is the only one who gives careful reason for his approval. His argument is that interest is legitimate, because, tho money itself be barren, money is used as a house is used, for gain of convenience or rent, and therefore that the lender of the money is entitled to interest as his share of the gain. Molinæus, taking somewhat the same ground, opposed the canon prohibition of interest. Besold, Grotius, followed hesitatingly in the same line till Salmasius (about 1640) poured out a flood of writing defending interest, and was followed by Bacon, North, Locke, Steuart, Hume, Galiani, Vasco, Beccaria, Mirabeau, and Bentham.

But this already brings us to modern times, when

Protestant Views.

capital and interest, having become matters of such vast moment, have elicited far more careful and scientific study. Turgot comes first. He defends interest on the ground that capital is always the equivalent of rent-bearing land, and therefore should receive interest as land brings forth fruit. This theory Böhm-Bawerk calls the "Fructification" theory, but says it explains nothing. What gives money its value in buying land? The power of being used; that is, of drawing interest. Therefore the answer begs the question. Adam Smith has no definite position, but throws out various hints about the origin of interest, some of which are utterly contradictory. His writings give in germ both what Böhm-Bawerk calls the "Productivity" theories, that capital gives an additional productivity to labor, and therefore gains remuneration; and also the "Socialistic theories," that interest is paid out of labor. But Adam Smith's neutral position could not be long held. The question of labor and capital has been the burning question of the century. Five answers have been developed through the century, and more or less side by side; so that we shall do best not to attempt to follow chronological order, but to see the separate schools as markedly and distinctly as possible.

First, Böhm-Bawerk puts what he calls the "colorless" answer, which, like Adam Smith's, is a confused answer, altho made by Ricardo, Torrens, McCulloch, and several continental writers. Ricardo, for example, tho he sharply and at length gives his conception of the law that governs the rate of return to capital, scarcely gives any reason for the return, save that, if capitalists did not receive any interest, they would not invest. His law, however, of the rate of interest has played such a large part in modern political economy that it must be stated. It is, of course, connected with his famous law of rent. The best land, he says, is ordinarily occupied first, and only gradually does the growth of population force people to improve and use poorer land. This poorer land, however, does not bring in so good returns as the first land, yet its produce has to be sold at a price enabling one to pay all costs and the necessary profit. This "margin of cultivation" fixes the market price. He who has the better land can get more return from it, or rent, so that rent is the difference between the annual return from the land and the annual return of a similar amount of land at the "margin of cultivation." Now, wages, under competition, cannot permanently rise much above nor fall much below the cost of existence, and the cost of existence is fixed by the cost of produce at the margin of cultivation. Therefore, as lower and lower grades of land are brought into use, and production becomes more and more expensive, wages and prices must both rise, and profits must fall, since rent of land, measuring the value of money, is fixed by the law above stated, and cannot be more than the difference between the annual return of the best land and that of land at the margin of cultivation. Hence, under increasing population wages rise, and prices with them, but profits fall. Competition of capitals, on which Adam Smith laid much weight, Ricardo makes little of, saying that it serves simply to lower profits temporarily, when increased quantity of capital (according to the well-known wage theory, which he accepted, but which has since been given up by almost all economists) at first raises wages. In a word, according to Ricardo, cost of existence determines wages, and wages determine profit. This theory, of course, is opposed, first, by those who deny the law of rent, that the best land is occupied first, etc.; and secondly, by those who, admitting its premises, argue that it neither explains why capital draws any interest, nor exactly measures it, because a thousand elements may affect both the margin of cultivation and the amount of profit men are willing to accept as their minimum profit from the margin of cultivation.

We come, then, to what Böhm-Bawerk calls the "Productive" theory, that capital actually produces wealth, and that before the capitalist who gets his interest simply gets what his capital produces. This theory is subdivided into four theories: (1) That capital serves toward the production of goods; (2) that it serves toward the production of more goods than could be produced without it; (3) that it serves toward the production of more value than could be produced without it; (4) that it serves toward the producing of more value than it has in itself. The first two of these theories

The Fructification Theory.

Ricardo.

The Productive Theory.

Böhm-Bawerk calls the "Naive-Productive" theories; the third he calls the "Indirect Productive" theory, and from the last theory spring such important theories that he considers them by themselves as "Use" theories.

Under the "Naive Productive" theory we have J. B. Say, who first broached this theory in 1803, brilliantly but not clearly, and confused with some elements of the "Use" theory, Schön, Riedel; in Germany the distinguished economist Roscher, who, however, is better on other questions than on this, Leroy-Beaulieu, Scioioja, and others. But the answer to this theory is simply that it has not been proved that capital in itself produces goods. Capital undoubtedly, as Roscher argues, enables labor to produce *more* goods; but the amount of return to capital has by no means been proved to be equal to the amount of value of the increased amount of goods it enables labor to produce. There must be, therefore, some other element that enters in as a controlling factor.

We come then to the "Indirect Productive" theory, that capital produces *more value*, first taught by Lord Lauderdale in 1804, and then by his greater follower, the not disciple, Malthus. Malthus carefully defines profit as "the difference between the value of the advances necessary to produce a commodity, and the value of the commodity when produced" (*Principle of Political Economy*, 2d ed., p. 262); but he does not equally carefully show why there should be this difference of value, tho he does in general point to capital as the producer of more value. Henry Carey and Peshine Smith, in America, follow the same school. Carey's well-known theory that the value of all goods is measured by their cost, counts capital as one of the costs, and since invention and civilization enable one to produce at lower and lower cost, and this applies to tools composing capital, capital must steadily fall in value, and therefore interest lower, tho profits may absolutely rise. Peshine Smith finds the origin of profit in a partnership between workman and capitalist, where capital furnishes the material and labor increases its value by infusing it with new labor, and both receive a share of the increased value in order to induce both to contribute to the result. This is not incorrect, but is superficial; it does not show just what capital contributes nor how much it receives in return. It simply says it produces more value. In Germany we have of this school the painstaking Thünen and Strassburger.

We come now to the "Use" theories, which, tho an offshoot of the "Productive" theories, quickly grew into an independent life of their own. This theory is

that capital, apart from its substance value, has a use value, and that the cap-

Use Theories.

italist who draws interest is thus rewarded for sacrificing the use of capital during the period of production. J. B. Say first suggested this, together with his "Naive Productive" theory, Hermann worked it out, and Menger gave it its best form. It is largely a German theory, Nebenius, Marlo, Bernhardt, Mangoldt, Schäffle, Kneis, besides Hermann and Menger, all following it in one form or another. Böhm-Bawerk, however, rightly maintains that there is no independent "use" of capital aside from capital, and that therefore this non-existent "use" cannot be the cause of interest; but even if it does exist, as apart from the substance of capital, it simply adds to the problem by raising two problems in place of one. What is this independent use of capital?

We come now to the famous "Abstinence" theory, first appearing in the lectures of N. W. Senior, in his Oxford University lectures, and later in his *Outlines of the Science of Political Economy* (1836). Adam Smith and Ricardo, with more distinctness, have pronounced labor to be the only source of value, and this, logically carried out, left no room for interest. Later writers saw this, and James Mill and McCulloch strove hard to prove that interest also was the wages of labor, but naturally with little satisfaction. Another party, as we have seen, with Malthus at their head, put cost as the measure of value and counted interest or profits as among the costs. But it was only too evident that profits were the surplus over the cost, and not a constituent part of them—a result and not a sacrifice. Now then came Senior's theory that interest was the reward of abstinence. Hints of this had appeared before in Ricardo and in Adam Smith's opposition of "future profit" to "present enjoyment," but which Senior first worked into a careful and logical system. According to this, capital is the result of labor, but of labor applied not to immediate results, but to far-off results; and, therefore, since its owner has

sacrificed immediate results to distant ones, he is indemnified by interest. He is able to secure this indemnification because the exchange value of goods depends, according to Senior, partly on the usefulness of the goods, partly on the limitation of their supply; and the limitation depends upon the number of those willing to abstain from immediate consumption of wealth to devote it to capital. The "maximum of price" is the sacrifice with which the buyer could himself produce or procure the goods; and the "minimum of price" is the cost of production. Under competition these approximate. But the cost of production consists of the sum of the labor and abstinence requisite for the production of the goods. If abstinence is always requisite for production, it can always command its money return.

Abstinence Theory.

The trouble with this theory is that it makes too sweeping a generalization from an idea containing at best some truth. As a matter of fact, the rate of interest does not at all follow the amount of sacrifice. High interest is often got by the millionaire, who makes no appreciable sacrifice whatsoever, and low interest is often obtained where the sacrifice is very great. The theory is now generally discarded (see ABSTINENCE, REWARD OF), yet it has had many followers, and some of them most distinguished, such as J. S. Mill, Jevons, Cairnes, Roscher, Schüz, Max Wirth, Rossi, Molinari, and Garnier. Bastiat accepted the doctrine under a developed form. Bastiat's great social law is "service for service." He argues that he who provides capital not only sacrifices present enjoyment, but does positive service by allowing the laborer to have now what otherwise he could only obtain later, by great sacrifice of his own tools. But this only confuses. He who sacrifices in order to prevent sacrifice certainly does so, but this is only one sacrifice, and cannot receive return for two.

We pass then to the next group, which Böhm-Bawerk calls "Labor" theories, because under various forms they try to prove that interest is payment to the capitalist for labor performed. The main advocates of this are James Mill, McCulloch, Courcelle-Seneuil, Rodbertus, Schäffle. Under one form or another they all argue that capital is stored-up labor, and that interest and profit are simply the price paid for stored-up labor. But how, then, does it happen that the capitalist eventually gets back all his capital; that is, all his stored-up labor, and yet gets interest too? Courcelle-Seneuil argues that interest is payment for the labor of storing up capital. This is artificial. Its falsity may be seen in the fact that interest has no connection with this, being often greatest where this so-called labor is least, and vice versa. This explanation, however, has been adopted by Rodbertus, Wagner, and Schäffle among other German "Socialists of the Chair." It is certainly, to say the least, inadequate, and therefore false.

We come then to what may be called the Socialist, or the "Exploitation" theory. According to this, all goods that have value are the product of human labor, and indeed, economically considered, are exclusively the product of human labor.

The Laborers, however, do not retain the Exploitation Theory.

The whole product of their labors, because capitalists, taking advantage of their command over the indispensable means of production, as secured to them by the institution of private property, secure to themselves a part of the laborer's product. The means of doing so are supplied by the wage contract, in which the laborers are compelled by hunger to sell their labor-power to the capitalist for a part of what they, the laborers, produce. Interest is thus a portion of the product of other people's labors, obtained by exploiting the necessitous condition of the laborer.

The way had been prepared for this by Adam Smith and Ricardo, in teaching that labor is the source of value; tho Adam Smith and Ricardo did not follow out their teaching to its socialist conclusion. Hodgskin in England and Sismondi in France were the first to really state the theory, and they only in a mild and general way; but it was soon taken up with strength and in earnest by Proudhon in France and Rodbertus in Germany, and then by the great socialist leaders, Lasalle and Marx, while it was adopted substantially or in part by men not wholly socialists, like J. S. Mill, Schäffle, Dühring, and others. Of the socialists, Rodbertus and Marx have worked out the theory most carefully. Rodbertus is considered by most political economists the most careful, altho Marx has worked out the theory the most brilliantly and the most popu-

larly. Rodbertus accepts almost as axiomatic the premise that labor, economically speaking, is the source of all value. Rent he defines as "all income obtained without personal exertion, solely in virtue of possession" (*Soziale Frage*, p. 146). It includes two kinds of rent—land rent and profit on capital. Rent owes its existence to two facts: economically, that, with machinery and division of labor, laborers can produce more than they require to support life; and legally, that private property in land and capital enables their owners to employ laborers who, not having land and capital, and needing them for production, are unable to work except in service for these capitalists, and are driven by hunger often to give to the capitalists all they produce except what is barely necessary to support life. The form which this compulsion originally took was slavery, the origin of which was contemporaneous with that of agriculture and landed property. To-day contract has taken the place of slavery; but since capitalists own substantially all the land and capital, they have the laborer as equally at a disadvantage as under slavery, and can take from him under contracts such as before under slavery. Thus, says Rodbertus, "The contract is only formally and not actually free, and hunger makes a good substitute for the whip. What was formerly called food is now called wage" (*Soziale Frage*, p. 33).

Thus all rent is an exploitation, or, as he says in effect, a robbery of the product of other people's labor (*Soziale Frage*, p. 150). The amount of rent increases with the productivity of labor; for under the system of free competition the laborer can receive little more than his maintenance, no matter how much he produce. The division between rent of land and rent of capital Rodbertus believes depends upon how much labor value is represented in land and in capital, since labor is the measure and source of all value, even rent being the product of labor, the conditioned by the possession of wealth. Nevertheless, except in a posthumous tract on *Capital*, Rodbertus does not favor the abolition of private property in either land or capital. He ascribes to it an educating power, a "kind of patriarchal power that could only be replaced after a completely altered system of national instruction, for which at present we have not got even the conditions" (*Erklärung*, p. 303).

Marx's theory is the same, tho worked out in a different way. The utility of a thing, he argues, is its *value in use*. But this value is not something in the air. It is limited by the properties of the commodity, and has no existence apart from that commodity. The commodity itself is the use value. Now use values exchange. They are measured. To be measured they must have some characteristic in common. What is this? It is not in their *qualities*; their qualities are very different. Things that exchange must have the same *quantity* of exchange value. What is the thing that they have the same quantity of? If we discard their qualities as use value, they have only one common property left, that of being products of labor. This must be the measure of their exchange value. So the value of all goods is measured by the quantity of labor contained in them or in labor time. But labor is of different value in different individuals; therefore, we must take the "socially necessary labor time"—*i. e.*, the labor time required to produce a use value under the conditions of production that are socially normal at the time, and with the socially necessary degree of skill and intensity of labor. Now the problem of capital and of interest and profit is this: One man sells the commodity which he possesses for money, in order to buy with the money another commodity which he requires. This course of circulation may be expressed by the formula: Commodity, money, commodity. But there is another course of circulation. Men buy commodities in order to sell, or—money, commodity, money. But in this circuit, men buy commodities in order to sell at an advance. The real circuit is M., C., M'. (M' representing the sum advanced plus an increment). This is the characteristic circuit of capitalistic industry. It applies seemingly only to the merchant's capital, but it is true of all industrial capital. The manufacturer, every one in commerce, even the farmer, buys something—invests, that is—in order to sell what he buys, or what springs from what he buys, at an advance. Whence the advance? This is the problem. He buys material at its market value; he sells the material at the market value; how is he enabled to sell at a higher price than he buys? Whence this surplus value? This is the problem of Marx's book—his famous *Capital*. The surplus value cannot originate in anything outside the circuit, for nothing

pours economic value into his hands. It cannot originate in the circuit itself, for he cannot continually buy commodities under their value, nor continually sell above their value. Whence his profits? He can only sell for more than he buys by adding labor to it. Labor is thus the only source of *surplus value*. But if he put labor into it, either his own or hired, he pays for that. How does the capitalist sell for more than he puts in? He must buy material and labor at their value, sell the result at its value, and yet draw out more than he puts in. How? Marx answers this by saying that there is one use value which possesses the peculiar property of being the source of exchange value; this is labor or labor power. It, labor power, is offered for sale on the market on the double condition that the laborer is personally free—for otherwise he would be a slave, not a seller of labor power; and that, secondly, he is deprived of all means of independently using his labor power, otherwise he would work for himself. The present condition of society furnishes these conditions. The capitalist makes use of this. The value of the commodity labor power, like that of all other commodities, is regulated by the labor time necessary for its reproduction; in this case, by the labor time necessary to produce the maintenance of the laborer. The capitalist gets the laborer to work for him. He gives him his labor time value—that is, maintenance, the value necessary to maintain and reproduce him. But the laborer gives the capitalist more labor time than this. If in six hours the laborer produces enough to maintain him, and works 10 hours, in the four hours he produces for the capitalist this "surplus value." Surplus value, therefore, according to Marx, results from the capitalist getting the laborer to work a part of the day for him without paying for it. In the laborer's day, thus, we have "necessary labor time" and "surplus labor time," the source of "surplus labor value." Capital is not thus a command over labor, but a command over *unpaid* labor. All surplus value, in whatever form it be disguised, as profit, interest, rent, or any other, is only the material shape of unpaid labor. Bitterly, upon this foundation, does Marx trace the history and expedients of capital to lengthen the time and intensity of the working day in order to get more surplus value.

The answer to this theory, which will be seen to be, in another form, the same as Rodbertus', may be very varied. It is perhaps sufficient, however, to say that it has not been proved that labor is the source of value. Exchange is not based simply upon labor-time value. Use value does affect exchange. A good natural voice, uncultivated by any labor, has exchange value. Unimproved natural commodities have exchange value. Scarcity affects exchange value. The whole theory that labor is the source of value is untenable. Rodbertus does not attempt to prove it. Marx appeals not to facts, but to the above dialectics, which can be shown to be faulty. Marx says use values in exchange are disregarded. This is not the case; but if it were, his conclusion does not follow that their being the product of labor is the only characteristic left which can be the basis of exchange. Many other elements enter in—scarcity, demand, appropriation of them, etc. Marx's analysis contains truth, but by no means the whole truth, and its fundamental proposition is not true.

We come now to several minor theories of capital. Rossi seems to use the Productivity and Abstinence theories alternately; so largely do Molinari, Leroy-Beaulieu, Roscher, Schütz, and Max Wirth and Cossa. Jevons, in an eclectic way, welds several theories together, finds the function of capital in that it enables us to expend labor in advance, but confuses "surplus in products" with "surplus in value." J. S. Mill adopts at various times three inconsistent theories—the Productivity, the Abstinence, and the Exploitation theory. Schäffle does substantially the same. Henry George adopts the old Frustration theory of Turgot and the physiocrats, but in a later form. He argues that capital commands interest, because certain forms of capital, like animals, etc., are fruitful, and that therefore men will not lend capital for nothing, when with it they could invest in live stock, agricultural capital, etc., that would bring in profit year by year. The trouble with this argument is that there is no ground for this distinction between natural capital and capital the product of human labor. There is no product into which nature does not enter. Man is natural. Again, Mr. George does not show that animals or land produce more animal value than the labor and the food spent upon them. Mr. Flüßscheim (*q. v.*), Mr. George's most distinguished follower in Germany, in his *Rent*,

Other Theories.

Wages and Interest shows the limitations of Mr. George's theory of interest.

Thus have we followed Böhm-Bawerk in critical analysis of all theories of capital, and have found complete satisfaction in none. But Böhm-Bawerk himself has a theory, developed in his second book, *The Positive Theory of Capital*. According to this theory, capital draws interest because capital contributes to production by *saving* time. By the use of capital men can perform their work more quickly than without it. Men desire to save time, to obtain results now rather than later, according to Böhm-Bawerk, because of three elements—the defect of imagination, defect of will, and uncertainty of life. But this theory seems equally faulty with those Böhm-Bawerk has so ably criticised. It is not those who have the least imagination or will, or are most uncertain of life, who desire capital the most. This psychologic theory must take its place with other faulty ones. The fact seems to be that no one theory is complete; that almost every theory yet advanced has had its element of truth and made its contribution to science. It is *man* who pays, and *man* who asks interest for capital. Men are not simple "economic men." The reasons that move the will to demand and pay interest are not simple, but numerous, intricate, and varying at different times. In the Fructuation theory, the Productivity theory, the Use theory, the Abstinence theory, the Exploitation theory, the Time theory, there is truth, but the whole truth lies only in the correct synthesis of all theories. It should be added, however, that whatever be the theory as to the origin of capital and interest, neither the believers nor the disbelievers in interest question the fact of the contribution, and the necessary contribution, that capital makes to production. Socialists, no less than the most conservative economists, admit the necessity of capital to production. Socialists simply assert that work (personal effort of head and hand) should be required from every member of society (save from the young, aged or infirm), and that there should be no class of society whose economic function is simply to furnish capital and live

The Socialist Contention.

on the interest. They declare that all *capital* should be owned and furnished by the community, and that all individuals should furnish work and receive, therefore, their rightful share in the product. (See SOCIALISM.) Those socialists who do not hold with Adam Smith, Ricardo, and Marx that labor is the only source of value, do not either hold that capital comes wholly from unpaid labor; they hold that capital may come from the personal labor of one's ancestors, or from personal saving, or by speculation or investment—in a hundred ways, some of them moral, some immoral; but they hold that, however gained, the unity of society is the key to the freedom of the individual, and that that freedom demands that capital be held and operated collectively for the equitable good of all, each man and woman being in some way a worker for the general good. This holding of capital is a step, in their opinion, not based on any theory, but called for by the conditions of human life, in the process of evolution, developing a higher organism out of lower organisms. Those socialists who look to Divine sanctions for their acts find this act requisite upon man's brotherhood, and natural unity resulting from God's

The Christian Socialist View.

Fatherhood. They argue that capital should be held in common and each work for the good of all, as a family holds property and work each for each. Interest on capital they say is "natural," because capital performs a natural function, and can therefore obtain a portion of the product, as conditional to its being forthcoming; and when capital is monopolized by a portion of the community, it can, subject to competition between capitalists, dictate its own terms, because he who has it is not dependent upon him who has. What such socialists assert is that, though interest is natural, it is money, since God has made all men one, and given to all the duty of labor; that therefore for one portion of society to furnish the capital and be able to live without labor, while another portion of society can scarcely live by the hardest toil, is a plain violation of the law of God. Such are the various theories as to capital that have prevailed at various times and are held to-day by various schools of thought.

Turning to the laws that govern the growth of capital, we present two representative treatments of the subject, and first, one by Professor

and Mrs. Marshall. In chap. vi. of their *Economics of Industry*, they say :

"The growth of capital depends upon the *power* and the *will* to save.

"The power of saving depends on the amount of wealth out of which saving can be made. Some countries, which have a large population and produce a great amount of wealth, have very little power of saving. The whole continent of Asia, for instance, has less power of saving than England has. The total produce indeed of its industry is larger than that of England; but the number of people among whom this is divided is so great that they are compelled to consume almost the whole of it in supporting life.

The Growth of Capital, Orthodox View.

"As Mill says, 'the fund from which saving can be made is the surplus of the produce of labor after supplying the necessities of life to all concerned in the production (including those employed in replacing the materials and keeping the fixed capital in repair); more than this surplus cannot be saved under any circumstances; as much as this, though it never is saved, always might be. This surplus is the fund from which the enjoyments as distinguished from the necessities of the producers are provided; it is the fund from which all are subsisted who are not themselves engaged in production; and from which all additions are made to capital. It is the real net produce of the country.'

"Since the requisites of production are land, labor, and capital, the conditions on which the total produce of industry depends may therefore be classed as, firstly, fertility of the soil, richness of mines, abundance of watercourses, and an invigorating climate; secondly, the number and the average efficiency of the working population; this efficiency depending on moral as well as mental and physical qualities; thirdly, the abundance of the means which the industry of the past has accumulated and saved to help the industry of the present; that is, the abundance of roads and railroads, of canals and docks, of factories and warehouses, of engines and machines, of raw material, of food and of clothing; in short, the already accumulated capital of the nation. . . .

"Next as to the will to save.

"The strength of the desire of accumulation depends on moral and social conditions which vary widely in different times and countries.

"(a) The intellect. The inclination to save arises from the hope of obtaining some future advantage, and this future advantage, if it is to afford motive for action, must be realized. Children and nations in an early state of civilization are almost incapable of realizing a distant advantage; the future is eclipsed by the present. . . .

"(b) Affection for others is one of the chief motives if not the chief motive for the accumulation of capital. . . .

"(c) The hope of rising in the world. If people feel that they are bound down forever by a sort of caste regulation to one station in life, they will not save in order to better their position; they will naturally have little motive to be frugal. . . .

"(d) The opportunity to gain great social advantages by the possession of wealth. . . .

"(e) Political and commercial security.

"A man who saves, hopes that he and his family may enjoy in security the fruits of his saving. This requires, firstly, that Government should protect his property from fraud and violence; secondly, that if he or those whom he leaves behind him are unwilling or unable to employ the capital in business themselves, they must be able to lend it out to others and to live in quiet on the interest of it. . . .

Lastly, Mr. and Mrs. Marshall inquire how far the accumulation of capital depends upon the rate of profits, and the rate of interest which the owner of capital can obtain by lending it to others, and they answer :

"A high rate of interest no doubt affords a liberal reward of abstinence, and stimulates the saving of all who are ambitious of earning social position by their wealth.

"But the history of the past and the observation of the present show that it is a man's temperament, much more than the rate of interest to be got for his savings, which determines whether he makes provision for his old age and for his family, or not. Most of those who make such a provision would do so equally whether the rate of interest were low or high. And when a man has once determined to provide a certain annual in-

come, he will find that he has to save more if the rate of interest is low than if it is high. Suppose, for instance, that a man wishes to provide an income of £400 a year on which he may retire from business, or to insure £400 a year for his wife and children after his death. If the current rate of interest is 5 per cent., he need only put by £8000 or insure his life for £8000; but if it is 4 per cent., he must save £10,000, or insure his life for £10,000.

"Again, a high rate of interest is a great inducement to retire early from business, and live on the interest of what has already been accumulated. Sir Josiah Child indeed said two centuries ago, 'We see that generally all merchants' in countries in which the rate of interest is high' when they have gotten great wealth, leave trading' and lend out their money at interest, 'the gain thereof being so easy, certain and great; whereas in other countries, where interest is at a lower rate, they continue merchants from generation to generation, and enrich themselves and the State.' It is more true now than it was then, that many men retire from business when they are yet almost in the prime of life, and when their knowledge of men and things might enable them to conduct their business more efficiently than ever. Thus a fall in the rate of interest would in some ways promote the production and the accumulation of wealth.

"But it would diminish the power of saving from a given amount of capital, because the larger the income a man derives from his business, the larger are the means he has of saving."

Such is an admirable example of the treatment of the subject from the standpoint of the most progressive orthodox economics. As an example of the treatment of the subject from the socialist standpoint, we give a quotation from the lecture on *The Industrial Basis of Socialism*, by William Clarke, and included in the *Fabian Essays*. Says Mr. Clarke :

"The capitalist was originally an *entrepreneur*, a manager who worked hard at his business, and who received what economists have called the 'wages of superintendence.' So long as the capitalist occupied that position he might be restrained and controlled in various ways, but he could not be got rid of. His 'wages of superintendence' were certainly often exorbitant, but he performed real functions; and society, as yet unprepared to take those functions upon itself, could not afford to discharge him. Yet, like the king, he had to be restrained by the legislation already referred to, for his power involved much suffering to his fellows. But now the capitalist is fast becoming absolutely

Growth of Capitalist Socialist View.

useless. Finding it easier and more rational to combine with others of his class in a large undertaking, he has now abdicated his position of overseer, has put in a salaried manager to perform his work for him, and has become a mere rent or interest receiver. The rent or interest he receives is paid for the use of a monopoly which not he, but a whole multitude of people, created by their joint efforts.

"It was inevitable that this differentiation of manager and capitalist should arise. It is part of the process of capitalist evolution due to machine industry. As competition led to waste in production, so it led to the cutting of profits among capitalists. To prevent this, the massing of capital was necessary, by which the large capitalist could undersell his small rivals by offering, at prices below anything they could afford to sell at, goods produced by machinery and distributed by a plexus of agencies initially too costly for any individual competitor to purchase or set on foot. Now for such massive capitals, the contributions of several capitalists are needed; and hence has arisen the joint-stock company or *Compagnie Anonyme*. Through this new capitalist agency a person in England can hold stock in an enterprise at the Antipodes, which he has never visited and never intends to visit, and which, therefore, he cannot 'superintend' in any way. He and the other shareholders put in a manager, with injunctions to be economical. The manager's business is to earn for his employers the largest dividends possible; if he does not do so, he is dismissed. The old personal relation between the workers and the employer is gone; instead thereof remains merely the cash nexus. To secure high dividends, the manager will lower wages. If that is resisted, there will probably be either a strike or lockout. Cheap labor will be,

perhaps, impoited by the manager; and if the work-people resist by intimidation or organized boycotting, the forces of the State (which they help to maintain) will be used against them. In the majority of cases they must submit. Such is a not unfair picture of the relation of capitalist to workman to-day, the former having become an idle dividend-receiver. The dictum of orthodox political economy, uttered by so competent an authority as the late Professor Cairnes, runs :

"It is important, on moral no less than on economic grounds, to insist upon this, that no public benefit of any kind arises from the existence of an idle rich class. The wealth accumulated by their ancestors and others on their behalf, where it is employed as capital, no doubt helps to sustain industry; but what they consume in luxury and idleness is not capital, and helps to sustain nothing but their own unprofitable lives. By all means they must have their rents and interest, as it is written in the bond; but let them take their proper place as drones in the hive, gorging at a feast to which they have contributed nothing."*

"The fact that the modern capitalist may be not only useless, but positively obstructive, was well illustrated at a meeting of the shareholders of the London and Southwestern Railway on February. . . . Three shareholders urged a reduction in third-class fares. The chairman pointed out the obvious fact that such a reduction would probably lower the dividend, and asked the meeting if that was what they wished. He was, of course, answered by a chorus of 'No, no!' and all talk of reduction of fares was at an end. Here is a plain sample (hundreds might be quoted) of the evident interests of the public being sacrificed to those of the capitalist.

"That joint-stock capitalism is extending rapidly every one knows. In the United States, according to Mr. Bryce, the wealth of joint-stock corporations is estimated at one fourth of the total value of all property.† In England every kind of business, from breweries, banks, and cotton-mills down to automatic sweetmeat machines, is falling into the hands of the joint-stock capitalist, and must continue to do so. Twenty years ago who would have supposed that a brewer like that of Guinness, or such a banking firm as Glyn, Mills & Co., would become a joint-stock company? Yet we know it is so to-day. Capitalism is becoming impersonal and cosmopolitan. And the combinations controlling production become larger and fewer. Barings are getting hold of the South African diamond fields. A few companies control the whole anthracite coal produce of Pennsylvania. Each one of us is quite 'free' to 'compete' with these gigantic combinations, as the principality of Monaco is 'free' to go to war with France should the latter threaten her interests. The mere forms of freedom remain, but monopoly renders them nugatory. The modern State, having parted with the raw material of the globe, cannot secure freedom of competition to its citizens; and yet it was on the basis of free competition that capitalism rose. Thus we see that capitalism has cancelled its original principle—is itself negating its own existence."

Concerning statistics as to the large part played by capital in the modern world, see WEALTH; TRUSTS; MACHINERY; DEBTS. A few statistics may be given here as an example concerning the United Kingdom of Great Britain and Ireland alone :

The profits of public companies, foreign investments, railways, etc., assessed to income tax in the United Kingdom in 1887-88 amounted to £110,630,000. The interest payable from public funds was, in addition, £46,512,000 (*Report of Commissioners of Inland Revenue, 1889, C—5843*).

That these amounts are understated may be inferred from Mr. Mulhall's estimate of the stocks, shares, bonds, etc., held in Great Britain alone, as being worth £3,491,000,000, producing an annual income of upward of £155,000,000 (*Dictionary of Statistics, p. 256*). And Sir Louis Mallet estimates the English income from foreign investments alone at £100,000,000 annually. (*National Income and Taxation, Cobden Club, p. 13*). Nearly the whole of this vast income may be regarded as being received without any contemporary services rendered in return by the owners as such.

We have, however, to add the interest on capital employed in private undertakings of manufacture or

* *Some Leading Principles of Political Economy, p. 32.*

† *The American Commonwealth, chap. iii., note on p. 421.*

trade. This is included with "wages of superintendence" in business profit, both for the purpose of the income tax returns and in ordinary speech. Mr. Giffen estimates it, apart from any earnings of personal service, at £50,000,000 (*Essays in Finance*, vol. II, p. 403).

The total amount of interest cannot, therefore, be less than £50,000,000. The part which capital plays in the whole world may be seen in the fact that the Compendium to the Eleventh Census of the United States gives the total national and local debts of the world at no less a sum than \$30,340,927,600. For a discussion of whether the profits or capital are falling, see DIMINISHING RETURNS, LAW OF.

Hobson (London, 1894).

CAPITALIZATION.—The word capitalization is used in several senses. It may mean (1) the application of wealth as capital to the purposes of trade, etc.; (2) the act of computing or realizing the present value of a periodical payment; (3) the conversion into capital, as when creditors consent to the conversion into capital of half of their claims (*Century Dictionary*). But there is also a fourth sense not wholly covered by any of the above, and yet a very common use of the word; neither the application of wealth as capital, nor the conversion of shares into capital, but the rating of plant or other form of capital at an enhanced and sometimes an utterly fictitious value, as a basis for the declaration of dividends. Says Professor Ely in his *Political Economy*:

"We must distinguish between capital invested and capitalization. Capitalization means the amount at which a property is valued, and it may be 10 times the cost of capital actually invested. When we speak of profits as being 10 per cent. or 5 per cent., we mean profits on free or disposal capital, and this rate depends on opportunities for production which are still open, not those which have already been seized. Let us suppose that the returns on investments still open to all are about 10 per cent., but that the returns to a telephone company or an electric lighting company which has actually invested \$100,000 is \$100,000; the undertaking will be capitalized at \$1,000,000, so as to conceal the actual rate of profits; and as profits fall on new investments open to all, capitalization of old and lucrative enterprises rises in proportion, altho no new capital is invested. One familiar form which this takes is "stock-watering," but it is also seen in higher prices. If a house yields \$1000 a year, and 10 per cent. is a fair return for house property, it will be valued at \$10,000; but if profits fall, and 5 per cent. is considered a good return, it will be valued at \$20,000. This increase of capitalization is sometimes an unconscious process, and a man will at times feel poorer when he is receiving 5 per cent. on his capitalization of an investment than when he was receiving 10 per cent., altho his capitalization has quadrupled without any additional investment of capital." (See STOCK-WATERING.)

CARBONARI.—A secret revolutionary or political society existing mainly in Italy and France, claiming great antiquity, with Francis I. of France as founder, but owing its modern activity at least to republicans and others in Naples who were dissatisfied with the French rule under the reign of Murat (1808-14). They are said to have been originally refugees from the mountains of the Abruzzi provinces, and to have taken their name from the mountain charcoal-burners. Their aim was to free Italy from foreign domination. After having aided the Bourbons in this, the organization spread all

over Italy and into France, as the champions of the national liberal cause against the reactionary governments. At one time they numbered several thousand adherents. About 1820-21 Lafayette became the head of the society in France. It played an important part in the Revolution of 1830, since when it has not been prominent, if in existence. (See *The Secret Societies of All Ages and Countries*, by C. W. Heckethorn.)

CAREY, HENRY CHARLES, was born in Philadelphia, Pa., in 1793, and died in 1879. He was the son of Matthew Carey, an Irish refugee and publisher who had written on economic themes. The son succeeded the father, but retired with a competency in 1835, and devoted his life to economics. Thirteen octavo volumes and 3000 pages of tracts, besides newspaper articles perhaps twice as voluminous, attest his industry, while the fact that many of his writings have been translated into seven different languages speaks for his ability and originality of thought. Says Palgrave's *Dictionary of Political Economy*:

"Carey began his scientific career at a juncture when the English school appeared to have exhausted its deductions from assumed premises, and to shrink from adjusting its conclusions to the conditions of actual life. His treatment of social science was original, and led him to a series of supposed discoveries, the order of which he has stated in the introduction to his most important work, *The Principles of Social Science*. His point of departure was a theory of value which he defined as the 'measure of the resistance to be overcome in obtaining things required for use, or the measure of nature's power over man'—in simpler terms, the cost of reproduction. This theory Carey applied to every case of value—to commodities, services, and land, and in some passages seemingly to man himself. Reasoning that every gift of nature is gratuitous, he found a universal tendency to a decline of value as the arts advance, and to a decrease in the value of accumulated capital, as compared with the results of present labor, with a resulting harmony of interests between capitalist and laborer. This theory Carey enunciated in his *Principles of Political Economy*, published in 1837-40, and its appearance in slightly modified terms in Bastiat's *Harmonies Economiques*, in 1850, led to a sharp discussion between the two authors in the *Journal des Economistes* for 1851."

Ten years later, in his *Past, Present and Future*, Carey expounded his notorious land theory, which was the exact reverse of the Ricardian; but though argued by Carey with great vigor and at great length, and eliciting much interest because of its novelty, it has been accepted by scarcely any other careful economist. It laid down the principle that men first till the poorer and more easily worked lands, and then descend upon richer lands as capital increases, so that with the advance of civilization the rate of return from land rises instead of falls. He deduced from this a rejection of the Malthusian doctrine, since rising returns from land could support more and more men. The only limit to this tendency he found in Herbert Spencer's conjectured law of the diminution of human fertility and ultimate equilibrium between numbers and subsistence. Carey seems to us to have based the somewhat true conclusion that civilization can increasingly support population upon more doubtful facts. Undoubtedly men do sometimes occupy the poorest lands first, and in so far Carey's voluminous illustrations furnish a need-

A Check upon Ricardo.

ed check upon Ricardo's too sweeping and *a priori* statements; nevertheless it is undoubtedly true that Ricardo's theory usually holds true, especially as applied to old countries. Carey seems to have been misled by paying too much attention to the conditions of land occupation in the United States, at the time he wrote by no means so densely populated as today.

Carey's cardinal principle, however, is found in the second chapter of his *Social Science*, where he states "the great law of molecular gravitation as the indispensable condition of the being known as man." This law of being he declares to be the same in matter, man, and communities. As, in the solar world, attraction and motion are in the ratio of mass and proximity, so, in the social world, association, individuality, responsibility, development and progress are proportionate to each other. This theory, not of analogy, but of absolute identity of law, Carey maintained with great vigor in the *Unity of Law*, published in his seventy-ninth year. This theory led Carey first to adopt and advocate those theories of free trade for which he is perhaps the best known in the United States; tho afterward, from the same principles, to retreat from this position. The central point of his social philosophy being association, as the primary condition of progress, in the commerce of exchange of commodities and of ideas between countries Carey thought he saw the opportunity for closer association, economic efficiency, and general efficiency, and hence argued strongly and determinedly for free trade, giving a strong impulse to the arguments now becoming common in this country. It was only later that he abandoned this belief, from a conviction that in the present state of the world the coordinating power of the Government must be used in order to preserve economic harmony and to arrive at ultimate freedom.

Such is a brief review of his main positions. So great was his ability and so distinctive his views, that his school of thought is sometimes called the American School of Political Economy. His main followers are E. Peshine Smith, and Professor R. E. Thompson, formerly of the University of Philadelphia. Professor Ingram, in his *History of Political Economy*, says of Carey (p. 173):

"His aim was, while adhering to the individualistic economy, to place it on a higher and surer basis, and fortify it against the assaults of socialism, to which some of the Ricardian tenets had exposed it. The most comprehensive as well as mature exposition of his views is contained in his *Principles of Social Science* (1859). Inspired with the optimistic sentiment natural to a young and rising nation with abundant undeveloped resources and an unbounded outlook toward the future, he seeks to show that there exists, independently of human wills, a natural system of economic laws, which is essentially beneficent, and of which the increasing prosperity of the whole community, and especially of the working classes, is the spontaneous result, capable of being defeated only by the ignorance or perversity of man resisting or impeding its action."

Carey's main works are: *Essay on the Rate of Wages* (1835); *Harmony of Nature* (privately printed, 1836); *Principles of Political Economy* (3 vols., 1837, 1838, 1840); *The Past, the Present, and the Future* (1848); *Harmony of Interests, Agricultural, Manufacturing, and Commercial* (1850); *Slave Trade, Domestic and Foreign* (1853); *Principles of Social Science* (3 vols., 1858-59); *Manual of Social Science* (edited by Miss M'Kean, 1864); *The Unity of Law, as Exhibited in the Relations of Physical, Social, Mental, and Moral Science* (1872).

CARLYLE, THOMAS (1795-1881).—Carlyle we consider here simply from the standpoint of social reform, yet this element forms no small portion of his life, and his contribution to social reform gave no slight impulse in the advance of the century. From the standpoint of the social movement, the nineteenth century must be divided into two nearly equal yet two very diverse parts. The first 50 years were, socially considered, negative, destructive, characterized by the freeing of the individual from the tyrannies and despotisms of government, monarchical and despotic. Its outcomes were democracy, free trade, competition, individualism. The last 50 years of the century are, socially considered, positive, constructive (or at least seeking construction), characterized by the collective thought supplanting individualism and developing in its place the social organism. Its outcomes are unity, cooperation, monopoly, centralization, socialism. The lines of force in these last 50 years are centripetal, as in the first half of the century they were unmistakably centrifugal. Carlyle belongs to the first half of the century, yet with no little trace of transition to the second. Living till 1881, his genius was matured, his views were formed, his greatest works were written before 1850. He is an individualist whose writings are full of undeveloped socialism. In more than his denunciation of wrong he is a John the Baptist, the last of the old prophets, and a forerunner of the new. The following quotation from Mazzini's magnificent essay on Carlyle pronounces, we believe, a just criticism. He says:

"Mr. Carlyle comprehends only the *individual*; the true sense of the unity of the human race escapes him. He sympathizes with all men, but it is with the separate life of each, and not with their collective life. . . .

"The nationality of Italy, in his eyes, is the glory of having produced Dante and Christopher Columbus; the nationality of Germany, that of having given birth to Luther, to Goethe, and to others. The shadows thrown by these gigantic men appear to eclipse from his view every trace of the national thought, of which these men were only the interpreters or prophets, and of the people, who alone are its depository. All generalization is so repugnant to Mr. Carlyle that he strikes at the root of the error, as he deems it, by declaring that the history of the world is fundamentally nothing more than the biography of great men (*Lectures*). This is to plead, distinctly enough, against the idea which rules the movement of the times. . . .

"In the name of the democratic spirit of the age, I protest against such views. History is not the biography of great men; the history of mankind is the history of the progressive religion of mankind, and of the translation by symbols or external actions of that religion. . . .

"The great men of the earth are but the marking-stones on the road to humanity; they are the priests of its religion. What priest is equal in the balance to the whole religion of which he is a minister? There is yet something greater, more divinely mysterious, than all the great men, and that is the earth which bears them, the human race which includes them, the thought of God which stirs within them, and which the whole human race collectively can alone accomplish. Disown not, then, the common mother for the sake of certain of her children, however privileged they may be; for at the same time that you disown her you will lose the true comprehension of these rare men whom you admire. Genius is like the flower, which draws one half of its life from the moisture that circulates in the earth, and inhales the other half from the atmosphere. The inspiration of genius belongs one half to heaven, the other to the crowd of common mortals from whose life it springs."

Yet we doubt if this does full justice to the work that Carlyle accomplished. It was Carlyle's great mission to discover and to proclaim to this generation the

world's need of God. And this he did as no other man in all this century, not even excepting the great Italian himself. "The beginning and the end of what is the matter with us," writes Carlyle, "is that we have forgotten God." This is also the beginning and the end of Carlyle's teaching. Now from this socialism follows of inevitable necessity. It is not only true, as Maurice showed, that "there can be no brotherhood without a common father," but it is equally true that there can be no common father without a brotherhood. The one follows logically from the other. If God be the father of all, as Carlyle declared, then all men must be brothers, as socialists declare. Carlyle may not himself have taken that step, but he compels his readers to take it. He was the seer of the present; he saw through all the shams of his day. He is the great unmasker. He showed the pettiness and the selfishness and the nothingness of the Manchester economy. He blew the clouds away that hide God from the world. Above all, Carlyle saw God *in man*. "Thou, thou, art man," he says, "the breath of God is in thee; thou art here below to develop thy being under all its aspects; thy body is a temple; thy immortal soul is the priest, which ought to do sacrifice and ministry for all."

Thus outlining Carlyle's general position, we condense his more detailed views from Palgrave's *Dictionary of Political Economy*, article "Carlyle." Carlyle conceived of political economy as a political

His Views. philosophy, which should tell us "what is meant by our country, and by what causes men are happy, moral, religious, or the contrary." (See *Life of Carlyle*, by Froude, vol. ii., p. 78.) Economics in the narrower sense he associated with Bentham and McCulloch (McCroudy), and nicknamed the "dismal science." He admires power, however, wherever he sees it. Says Palgrave's *Dictionary of Political Economy* of Carlyle's views on this point:

"Even 'mammonism' itself 'has seized some portion of the message of nature to man; and, seizing that and following it, will seize and appropriate more and more of nature's message' (*Past and Present*). The English people are the wisest in action, and their practical material work is the one thing they have to show for themselves that is true and solid (*Past and Present*). But he has done most service to economics by his criticisms. When *Past and Present* appeared (1843) the *Deutsch-Französische Jahrbücher* of Marx and Engels at once took note of it as the most important book of the day on social questions. Carlyle thus showed that extreme *laissez-faire* may mean disintegration of society and simple anarchy; it removes old bonds, and leaves men disjoined from each other, except for the 'nexus of cash payments.' The result is the 'nomadic servitude' of the working classes and the destruction of all security and permanence in their conditions of life. In the *Nigger Question* (1840) he allows no advantage to the English laborer over the West Indian slave; the slaves were 'hired for life,' and the workmen are hired by the job. He points to the common liability to disease as a wholesome reminder to the rich of their common humanity with the poor (*Past and Present*), and when he impresses on economists the fact that the 'economic man' is an abstraction, and the universe is not one huge shop. He derides mere skill in selling cheap (*Bobus of Houndsditch*), and even industrial enterprise, so far as it aims at profit-making (Hudson, *Plugson of Undershot*, etc.). But he is firm against corn laws, and against the landowners who 'refuse to take the market rate for their onions,' and forget that they did not make the land of England. He goes farther than most economists in his estimate of 'captains of industry,' and in his view that the relation of master and servant is eternal (*Nigger Question*). He shows no appreciation of the power of workmen's combinations, and has no sympathy with nations and peoples as distinguished from individuals. On the whole, economists have learned more from his protests against abstract Ricardian political economy and its tendency to reduce the State to 'anarchy plus the constable,' than from any of his positive teachings. His pleadings had their influence even with men like John Mill, who were perfectly aware of their defects of logic."

The following quotations, perhaps, give a correct idea of Carlyle's positions, style, and power in the world of reform:

"To whom, then, is this wealth of England wealth? Who is it that it blesses; makes happier, wiser, beautiful, in any way better? Who has got hold of it, to make it fetch and carry for him, like a true servant, not like a false mock-servant; to do him any real service whatsoever? As yet no one. We have more riches than any Nation ever had before; we have less good of them than any Nation ever had before. Our successful industry is hitherto unsuccessful; a strange success, if we stop here! In the midst of plethoric plenty, the people perish; with gold walls, and full barns, no man feels himself safe or satisfied. Workers, Master Workers, Unworkers, all men, come to a pause; stand fixed, and cannot go farther.' Fatal paralysis spreading inward, from the extremities, in St. Ives workhouses, in Stockport cellars, through all limbs, as if toward the heart itself. Have we actually got enchanted, then; accused by some god?" (Proem to *Past and Present*, chap. i.)

"True, it must be owned, we for the present, with our Mammon-Gospel, have come to strange conclusions. We call it a Society; and go about professing openly the total separation, isolation. Our life is not a mutual helpfulness; but rather, cloaked under due laws-of-war, named 'fair competition' and so forth, it is a mutual hostility. We have profoundly forgotten everywhere that *Cash-payment* is not the sole relation of human beings; we think, nothing doubting, that it absolves and liquidates all engagements of man. 'My starving workers?' answers the rich mill-owner. 'Did not I hire them fairly in the market? Did I not pay them, to the last sixpence, the sum covenanted for? What have I to do with them more?' Verily Mammon-worship is a melancholy creed. When Cain, for his own behoof, had killed Abel, and was questioned, 'Where is thy brother?' he too made answer, 'Am I my brother's keeper?' Did I not pay my brother his wages, the thing he had merited from me?"

"O sumptuous Merchant-Prince, illustrious game-preserving Duke, is there no way of 'killing' thy brother but Cain's rude way?" (*Past and Present*, Part III., chap. ii.)

Carlyle's social writings were not his first. They belong to his best period. *Signs of the Times* was first published in the *Edinburgh Review*, and written perhaps at the very time he was writing *Sartor Resartus*. *Chartism* (1839) and *Past and Present* (1843) appeared soon after *The French Revolution* (1837). These, with portions of the last-named works, are his main writings on social themes.

CARNEGIE, ANDREW, manufacturer, was born in Dunfermline, Scotland, November 25th, 1835. His father, a weaver in humble circumstances, but ambitious to rise, and an ardent republican, came with his family to the United States in 1845, and settled in Pittsburgh. Two years later Andrew began his career by attending a small stationary engine. Later he became a telegraph messenger, and subsequently an operator. He was one of the first to read telegraphic signals by sound. He became clerk to the superintendent of the Pennsylvania Railroad, and manager of the telegraph lines. While in this position he grew interested in the sleeping-car invention, and joined in the effort to have it adopted. The success of this venture gave him the nucleus to his wealth. He was promoted to be superintendent of the Pittsburgh division of the Pennsylvania Railroad, and about this time was one of a syndicate who purchased property on Oil Creek, which cost \$40,000, and in one year yielded over \$1,000,000 in cash dividends. He was subsequently associated with others in establishing a rolling-mill, from which has grown the most extensive and complete sys-

tem of iron and steel industries ever controlled by an individual.

Besides directing these great iron industries, he for a long time owned 18 English newspapers, which he controlled in the interests of radicalism. He has devoted large sums of money to benevolent and educational purposes. In 1879 he erected commodious swimming baths for the use of the people of Dunfermline, Scotland, and in the following year gave \$40,000 for the establishment there of a free library, which has since received other large donations. In 1884 he gave \$50,000 to Bellevue Hospital Medical College to found a historical laboratory, now called the Carnegie Laboratory; in 1885, \$500,000 to Pittsburgh for a public library; in 1886, \$250,000 to Allegheny City for a music hall and library, and \$250,000 to Edinburgh, Scotland, for a free library. He has also established free libraries at Braddock, Pa., and at other places for the benefit of his employees. In New York City he has built a Music Hall. Mr. Carnegie is a frequent contributor to periodicals on the labor question and similar topics, and has published in book form *An American Four-in-Hand in Britain* (New York, 1883); *Round the World* (1884); and *Triumphant Democracy; or, Fifty Years' March of the Republic* (1886); the last being a review of American progress under popular institutions, which he believes to be the most successful in the world. (See HOMESTEAD.)

CARPENTER, EDWARD, was born at Brighton, England, in 1844. He graduated at Cambridge in 1868, and took orders in 1869. He was for a time curate to the Rev. F. D. Maurice (*q.v.*), at St. Edward's, Cambridge, where he also held a fellowship. About 1871, however, he changed his religious views, and resigning his fellowship and curacy, was for seven years a university extension lecturer on science, music, etc. In 1877 he visited the United States, seeing Walt Whitman among others. In 1881 he took to a simple yet artistic farm life, somewhat after the idea of Thoreau (*q.v.*), near Sheffield, and began writing *Toward Democracy*, issued in 1883, when he first definitely joined the socialist movement. In 1886 he commenced making sandals, in which he now carries on quite a trade. He has since published *England's Ideal* (1887 and 1895); *Chants of Labor* (1889); *Civilization: Its Cause and Cure* (1889), with other books. He has issued from the Labor Press, Manchester, several pamphlets on sex questions—*Sex-Love, Woman, Marriage*. His farm is at Holmsfield, Sheffield. As an example of Mr. Carpenter's thought and style we quote the following passage from his *Civilization: Its Cause and Cure* (pp. 39, 40):

"To-day it is unfortunately perfectly true that man is the only animal who, instead of adorning and beautifying, makes nature hideous by his presence. The fox and the squirrel may make their homes in the wood, and add to its beauty in so doing; but when Alderman Smith plants his willa there the gods pack up their trunks and depart; they can bear it no longer. The bushmen can hide themselves and become indistinguishable on a slope of bare rock; they twine their naked little yellow bodies together, and look like a heap of dead sticks; but when the chimney-pot hat and frock-coat appears, the birds fly screaming from the trees. This was the great glory of the Greeks, that they accepted and perfected nature; as the Parthenon

sprang out of the limestone terraces of the Acropolis, carrying the natural lines of the rock by gradations scarce perceptible into the finished and human beauty of frieze and pediment, and as, above, it was open for the blue air of heaven to descend into it for a habitation, so throughout in all their best work and life did they stand in this close relation to the earth and the sky, and to all instinctive and elemental things, admitting no gulf between themselves and them, but only perfecting their expressiveness and beauty. And some day we shall again understand this which, in the very sunrise of true art, the Greeks so well understood. Possibly some day we shall again build our houses or dwelling-places so simple and elemental in character that they will fit in the nooks of the hills or along the banks of the streams or by the edges of the woods without disturbing the harmony of the landscape or the songs of the birds. Then the great temples, beautiful on every height, or by the shores of the rivers and the lakes, will be the storehouses of all precious and lovely things. There men, women, and children will come to share in the great and wonderful common life; the gardens around will be sacred to the unharmed and welcome animals; there all store and all facilities of books and music and art for every one; there a meeting-place for social life and intercourse; there dances and games and feasts. Every village, every little settlement, will have such hall or halls. No need for private accumulations. Gladly will each man, and more gladly still each woman, take his or her treasures, except what are immediately or necessarily in use, to the common center, where their value will be increased a hundred and a thousand fold by the greater number of those who can enjoy them, and where far more perfectly and with far less toil they can be tended than if scattered abroad in private hands. At one stroke half the labor and all the anxiety of domestic caretaking will be annihilated. The private dwelling-places, no longer costly and labyrinthine in proportion to the value and number of the treasures they contain, will need no longer to have doors and windows jealously closed against fellow-man or mother nature. The sun and air will have access to them, the indwellers will have unfettered egress. Neither man nor woman will be tied in slavery to the lodge which they inhabit; and in becoming once more a part of nature, the human habitation will at length cease to be what it is now for, at least, half the human race—a prison."

CARPENTERS. See BROTHERHOOD OF CARPENTERS AND JOINERS.

CASSON, HERBERT N., was born in 1869, in Ontario, Canada, of English parents. Educated at Victoria College, he entered the Methodist ministry in 1890. Becoming a socialist, he gave up his church and its creed and came to Boston, Mass., in 1893. He took a leading part in the agitation for the unemployed, and in January, 1894, he moved to Lynn, Mass., and founded (in America) the Labor Church Movement (*q.v.*). He is the author of several spirited socialist tracts.

CASTRATION.—Members of the medical profession frequently recommend castration as a punishment for certain offences, and as a method of treatment for "sexual perverts." Boies' recent work on *Prisoners and Paupers* culminates in this recommendation. While advances in modern surgery make this a comparatively safe and painless operation, it is doubtful if it will be permitted by modern communities.

Professor A. G. Warner thinks it may ultimately be very widely used in the treatment of the diseased and criminal classes. He says (*American Charities*, p. 133):

"It is likely to be introduced first as a curative treatment in the cases of the insane and the feeble-minded. Dr. Kerlin, in addressing the Association of Medical Officers of Institutions for the Feeble-Minded, said: 'While consider-

ing the help that advanced surgery is to give us, I will refer to a conviction that I have that lifelong salutary results to many of our boys and girls would be realized if before adolescence the procreative organs were removed. My experience extends to only a single case to confirm this conviction; but when I consider the great benefit that this young woman has received, the entire arrest of an epileptic tendency, as well as the removal of inordinate desires which made her an offence to the community; when I see the tranquil, well-ordered life she is leading, her usefulness and industry in the circle in which she moves, and know that surgery has been her salvation from vice and degradation, I am deeply thankful to the benevolent lady whose loyalty to science and comprehensive charity made this operation possible." (See *PENEOLOGY*, last section.)

CATALLECTICS (from Gr. *καταλλάσσειν*, to exchange), the science of exchanges, a name adopted by Whately as a designation of political economy, on the ground that exchange occupies such a fundamental place in the sciences. (See *POLITICAL ECONOMY*.)

CAUSES OF POVERTY. See *POVERTY*; *CRIME*, etc.

CELIBACY. See *MONASTICISM*.

CENTRALIZATION is used in social science for the tendency to administer, by the sovereign or the central government, matters which might be placed under local management. The legitimate application is to a state of change from local to central management. Europe today is profoundly moved by the tendency, and has been ever since the existing European States began to grow out of the chaos of the fall of the Roman empire. That empire itself was, however, the greatest instance of centralization which the world has yet seen. In it the numerous municipalities and other local organizations originally existing in Italy, and communicated to the colonies, were entirely centralized. In England we can trace centralization from the time when there were about a dozen kings in Britain, and perhaps as many in Ireland, till the United Kingdom came under the rule of one monarch. In other countries—as, for instance, in France, notwithstanding her desperate struggles for freedom—the process long tended to a pure irresponsible despotism, but now has issued in a centralized republicanism. The British Constitution turns the process to use instead of mischief. While administrative authority has been centralizing in the Crown, the controlling power of Parliament has been increasing more rapidly, so that the vesting of a function in the Crown means the putting it under the control of Parliament, and especially of the House of Commons. There is nothing done in any of the offices under the Government for which a secretary of state, or some other member of the ministry, may not at any time be called to account. The creation of the county councils is a recent step in this direction in a somewhat different line.

In the United States the problem of centralization or decentralization has, under different names (see *STATE RIGHTS*), played a very important part. It may be said to be the distinguish-

ing point between the two great political parties which, under different names, have from the beginning divided this country.

In the first continental congresses, the fundamental problem was how much power to give each State, and when the Constitution was proposed, this was still the burning question. Led by Hamilton, the men who believed in a somewhat strong central government gradually took the name of Federalists, gaining their ideas mainly from England; while, largely under the lead of Jefferson, those who believed in giving much power to the States and little to the central government took the name of Republicans, or Democratic-Republicans, and are the direct ancestors of the present Democratic Party. Washington, though in reality of neither party, was by force of circumstances a Federalist, and during his presidency (1789-97), with that of Adams (1797-1801), this party was in power, giving us the necessary unifying elements of our Constitution, especially as regards financial measures. Then, owing to Federalist errors, the Republican-Democratic Party came into power, with Jefferson (1801-1809), Madison (1809-17), and Monroe (1817-25). During this long period of "Jefferson democracy," the decentralizing States-rights influence was in power. The doctrine that that was the best government which governed least applied to the States, but especially to the central government. The Jeffersonian party was strong with the masses and the agricultural interests. Jefferson did away with much of the ceremonialism of Washington. The Federalists were strong with the commercial and manufacturing interests and the Puritanism of New England, which, in spite of worship of the local "town-meeting" self-government, revolted at the atheism of the French Revolution, and connected it with the Democratic-Republican Party. In general the Federalists stood for a loose construction of the Constitution, since this gave them opportunity to expand the central powers, altho they were ready to resist Congress when she stood in their way (there was even talk of a secession of the trading States from the Union), while the Jeffersonians generally favored strict construction, since that would limit the powers of government; yet they were willing even to violate the Constitution, if that were necessary, to effect the purchase of Louisiana. Hamilton, however, died in 1803, and the Federalists had no leader.

In 1825, however, there came a change. Sectional quarrels under Monroe led to the election of John Quincy Adams (1825-29), who was, on the whole, a Federalist, tho he had toyed with the Republican-Democrats; and under the personal influence of Clay and Jackson, two great parties were again developed—the one, under the name of Democrats, maintaining the traditions of the old Democratic-Republican Party, and electing its candidate, Andrew Jackson (1829-37); the other, under the name, first, of National Republican and then Whig, maintaining the principles of the Federalists. The question of centralization was at this time carried out in another direction, in Jackson's vehement attack upon the National Bank of North America, which had been chartered by Congress. (See *BANKS AND BANKING*.) Resting mainly upon the Southern and agricultural vote, the Democrats were inclined to free trade, while the Whigs, with their manufacturing interests, favored protection. Meanwhile, another great question, which, while it had existed from the beginning, only now became so serious, was modified by the same contest between centralizing and decentralizing tendencies. The South, mainly Jeffersonian, or Democratic, believed in State rights and slavery. The North, more Federalist, or Whig, gradually came to oppose slavery. Nevertheless, the Southern Democrats feared to break with Northern Democrats, and the Northern Whigs feared to alienate the South, and, therefore, temporized. The result was a complication of issues, the springing up of new parties—Abolitionists, Free Soilers, etc.—and the election of Van Buren (1837-41), Democrat; W. H. Harrison, who died shortly after his inauguration (1841), Whig, leaving John Tyler President (1841-45), who was only nominally a Whig, and really a Democrat; James K. Polk (1845-49), Democrat; Zachary Taylor (1849), Whig, who also died soon after inauguration, leaving Fillmore President (1850-53), Whig; Pierce (1853-57), Democrat; Buchanan (1857-61), Democrat.

The War of the Rebellion was fought not directly to abolish slavery, but to preserve the union by conquering the States which had pushed the decentralizing

In the

States.

State
Rights.

State-rights doctrine to the extreme of secession. The Whig Party had now given place to a new party, the Republican, made up of Whigs, Free Soilers, and others, which yet on questions of centralization, protection, etc., carried out Whig principles. The election of Lincoln (1861-65), Republican; the victory of the North; Lincoln's assassination, Andrew Johnson, Vice-President, becoming President (1865-69), Republican, are well known.

Since the war the State-rights question has been less prominent, it having been largely settled by the war; but the centralizing or decentralizing question has still remained, its sides being advocated respectively by the Republican and Democratic parties, electing Grant, Republican (1869-77); Hayes, Republican (1877-83); Garfield (1881), Republican, with Arthur, Republican, Vice-President, and, by Garfield's death, becoming President (1881-85); Cleveland, Democratic (1885-89); Harrison, Republican (1889-93); Cleveland, Democratic, (1893-97). (See STATE RIGHTS.)

The present growing problems of social reform are also affected by the same tendencies, some advocating a highly centralized government; others (even most socialists and nationalists) advocating a decentralized government, with great emphasis on local self-government, as developed in the old Saxon folk-mote and the New England town-meeting, giving us municipalism as even more important than the national element of nationalism, which includes all governmental action, State and municipal. Many socialists, and notably William Morris in England, favor a government so decentralized as to be little more than a confederation of communes.

This brief *résumé* will indicate how far this question has entered into our national history and how far it may yet affect our national politics and procedure.

CHALMERS, Dr. THOMAS (1780-1847), a distinguished Scottish divine, we consider here mainly in relation to his great contribution to social experiment and theory. Born at Anstruther, in Fifeshire, he was early destined to the Church, and at the age of 11 was enrolled as a student in the University of St. Andrews. In 1803 he was ordained as minister of Kilmarnock, a small parish near St. Andrews. He taught classes at St. Andrews, and gained great popularity and fame throughout all Scotland. In 1815, after a battle over his evangelical views, which were then much opposed, he became minister of the great Tron parish, in Glasgow, and in 1819 of the parish of St. John's. It was in Glasgow that Dr. Chalmers did the great social work of which we shall soon speak; but in 1828 he accepted the chair of Theology in Edinburgh. Here he finished, in three volumes, his *Christian and Civic Economy in Large Towns*, which he had begun before, and his *Political Economy*, besides many theological and philosophical works. Here, too, he had more leisure for general church activities, and he was placed at the head of the Church Extension Committee. In 1834 the Church had voted that "no minister shall be intruded into any parish contrary to the will of the parish," and that the dissent of the majority of the male heads of families, being communicants, should be a bar to settlements. The courts now held that the Church had no right to determine this, and a controversy and struggle rose which resulted in suspension of Dr. Chalmers and many others for upholding this vote of the Church; and finally, in 1843, in the withdrawal of 470 clergymen from the General Assembly, who constituted themselves the Free Church of Scotland, with Dr. Chalmers as their first moderator. The last four years of his life were spent in organizing this church and in perfecting his *Institutes of Theology*, as principal of the first Free Church college.

We now come to notice more carefully his social experiments and positions.

In visiting his first Glasgow parish, which contained a population of about 11,000 souls, he speedily discovered that nearly a third of them had relinquished all connection with any Christian church, and that their children were growing up in ignorance and vice. The appalling magnitude of the evil, and the certainty of its speedy and frightful growth, at once arrested and engrossed him. To devise and execute the means of checking and subduing it became henceforth one of the ruling passions of his life. Attributing the evil to the absence of those parochial influences, educational and ministerial, which wrought so effectually for good in the smaller rural parishes, but which had not been brought to bear upon the overgrown parishes of our great cities, from all spiritual oversight of which the members of the Establishment had retired in despair, his grand panacea was to revivify, remodel, and extend the old parochial economy of Scotland. Taking his own parish as a specimen, and gauging by it the spiritual necessities of the city, he did not hesitate to publish it as his conviction that not less than 20 new churches and parishes should immediately be erected in Glasgow. All, however, that he could persuade the town council to attempt was to erect a single additional one, to which a parish containing no fewer than 10,000 souls was attached.

In 1819 he became minister of the parish of St. John's. This parish contained 2000 families, chiefly weavers, factory operatives and laborers. More than 800 families had no connection with any church; and nearly all the children were uneducated. He at once established two large school-houses, in which 700 children were taught at very low fees. For those too poor to afford even a small school-fee he opened 40 or 50 Sabbath-schools. In a short time these Sabbath-schools contained 1000 children. Dr. Chalmers then divided his parish into 25 districts, and placed over each an elder, to watch over the spiritual interests of the people, and a deacon, to care for their temporal interests. He retained control and direction of all, not only overseeing the work of others, but making 1000 visits among the families annually, and holding evening meetings. It was his special desire to test the old Scotch method of caring for the poor—by voluntary contributions taken at the church door and administered by the kirk session. He was strongly against the English system of compulsory assessment; and obtained permission of the Glasgow magistrates to try the Scotch plan with St. John's. His experiment was a complete success. When he took the parish its poor cost the city about \$7000 a year; but after four years of his management this sum was reduced to less than \$1400 a year. This was done by his thorough organization of the parish, his rejection of the idle, drunken and vicious, his personal visits among the poor and kindly sympathy with them, and his stimulation of the needy to self-respect and industry.

His *Political Economy* seeks to secure the economic elevation of society by moral means. He defined political economy as the "diffusion of sufficiency and comfort." He believed that without a Christian education to give self-control, progress would be impossible. He felt the need of a more radical cure than philanthropy and a more sympathetic one than legislation. He favored home trade rather than foreign trade. His economic idol was agriculture, as giving both occupation and maintenance.

CHAMPION, HENRY HYDE, was the son of General Champion, and himself at one time a captain in the Royal Artillery. His early career was such as to foster the resoluteness and precision which characterize him. After serving with his regiment in India and other places, gaining attention as a promising young officer, he threw up his commission as a protest against the unjust Egyptian campaign. Settling in London, he bought an interest in the "Modern Press" publishing house. About this time he became intensely interested in Henry George's *Progress and Poverty*, which was just published. Meet-

ing Henry George, he soon became an ardent disciple, and took a leading part in the agitation which was raised in England during Mr. George's visit. Afterward coming in contact with the new socialist movement, he became a member of the Social Democratic Federation, where his ability made him one of the leaders. He was closely identified with that society until 1888, when he severed his connection. In 1886 he was, with Messrs. Hyndman, Burns, and Williams, tried at the Old Bailey on a charge of "uttering sedition and inciting to violence," but was acquitted. In 1888 he founded the Labor Electoral Association, which by organizing the labor interests greatly affected the voting in several of the parliamentary bi-elections. He also took an active part in organizing the unskilled workers into trade-unions, on the lines from which has since developed the "new unionism."

CHANT, Mrs. LAURA ORMISTON (*née* **DIBBIN**), was born at Chepstow, Monmouthshire, October 9, 1848, and when about five years of age her parents removed to London. When 15 years of age she became a Sunday-school teacher, carrying on that work in different portions of England until she was 22. She taught in three ladies' schools for five or six years, after which she became a hospital nurse, and a year later became sister in the London Hospital in Whitechapel, meeting there her future husband. She decided to undertake the study of medicine, but owing to the powerful opposition of medical schools to women in the profession, and lack of means, did not qualify before marriage. Afterward she became absorbed in philanthropic work. This, with her services as a public speaker, has given her the reputation she enjoys. Her experience as a nurse, and also as assistant manager of a lunatic asylum, is of great value to her in her work, as her house is indeed a refuge for the destitute, a place where broken lives are brought under the influence of loving care. Her home circle is seldom if ever without the lonely and poor, the outcast and criminal, as well as the stupid and giddy. This makes her personal work with individuals far above her other work.

Mrs. Chant made her first public address on *The Position of Women in the Nineteenth Century*, advocating the franchise for them. She next appeared on the temperance platform, and then on that of social purity. Mrs. Chant is on the executive committee of the Women's Liberal Federation of England, of which Mr. Gladstone is president. She serves in the same capacity in the National Society for Promoting Woman Suffrage; is vice-president of one or more liberal associations; vice-president of the Peace Society, and member of the council of the National Vigilance Association of Great Britain and Ireland. She ardently advocates physical training and gymnastics, having written an introduction to Melio's work on gymnastics, and has also written and lectured on gymnastics. She produced the two grand sermons, *The Spiritual Life* and *Signs of the Times*, and is the author of one volume of poems entitled *Verona*. Her latest prominent activity has been her successful attack upon the Empire, as one of the most notorious, and, in her opinion, most evil, of London's music halls.

CHARITY ORGANIZATION SOCIETIES, OR ASSOCIATED CHARITIES, are in their present form a distinctly modern movement. In 1819 the Rev. Dr. Chalmers (*q.v.*), in his parish at St. John's, Glasgow, comprising 10,000 souls, in the poorest part of the city, became convinced that miscellaneous almsgiving did more harm than good; and, with the consent of the civic authorities, he undertook to stop all such bestowal of alms, and instead to institute a system of friendly visiting among the needy by a large corps of workers, who were only to give relief in case of extreme necessity, but to do all they could to enable the poor to help themselves. The result was considered very favorable; the amount of pauper relief was very much diminished, and yet there was less suffering than poor. After Dr. Chalmers, however, left the parish, in 1823, the experiment dragged on for 14 years and then came to an end. Meanwhile similar experiments on a smaller scale were made elsewhere. From 1828-44 district visiting societies were formed in several London societies, while societies for repressing mendacity in begging were much older. In 1868 Edward Denison (*q.v.*), a son of the Bishop of Salisbury, went to live in the East End of London to study for himself at first hand the problems of the poor. He became convinced of the same principles at which Dr. Chalmers had arrived. He wrote:

"I am beginning seriously to believe that all bodily aid to the poor is a mistake; whereas by giving alms you keep them permanently crooked. Build school-houses, pay teachers, give prizes, frame workmen's clubs, help them to help themselves, lend them your brains, but give them no money, except what you sink in such undertakings."

As a result, in 1869 a society was formed to act upon these principles, organized by Denison and some friends spurred on by his words and the experience of Octavia Hill (*q.v.*) in her work with her poor tenants. The society was called the London Society for Organizing Charitable Relief and Repressing Mendacity, soon popularly abbreviated into the Charity Organization Society. The movement rapidly grew, and aimed at bringing all the vast charitable relief of London, whether legal, corporate, or individual, into one administration. It has not done this, but has become a vast and thoroughly organized system, with a network throughout England.

There is now in London a central committee with district committees in every poor-law union. The central committee does not relieve directly, but aims at propagating sound views on the subject of charity by publication and discussion, promoting cooperation, suggesting new institutions on good principles, collecting information relating to individuals and of general import, and preventing misapplication. The district committees in London and the 68 affiliated societies in England and Scotland not only organize, but also administer relief on certain principles. Those principles may be summed up as follows: 1. That all relief should aim at making the recipient independent of relief. 2. That no relief should be given

without thorough inquiry and investigation. 3. That existing institutions should be utilized as far as possible. 4. That all relief should be adequate to secure the object with which it is given.

The council consists of the chairman, vice-chairmen, and treasurers; of annually elected representatives from each district committee, with its chairman and secretaries not exceeding two; of additional members in the proportion of one to four district representatives; and of representatives of London charitable institutions. This council works through an executive committee. There are 39 district committees, one for each metropolitan poor-law union. As far as possible, these consist of ministers of religion, guardians of the poor, and representatives of the principal local charities. The society comprises the district committees and donors of one guinea or more to the funds of the council, and it meets annually or by special call. District committees are to deal with all cases of alleged want referred to them. The council supervises and assists the district committees, considers questions of principle and general methods, seeks the systematic cooperation of London's larger institutions, to improve the administration of charity, and to suppress imposture; and it corresponds with similar societies elsewhere.

According to the report of 1892 there were, for the year 1890-91, in the 39 London districts, 23,476 applications for help decided and 2563 were withdrawn; 9490 cases were not assisted, 11,943 were; 5616 were aided by local agencies, 218 by guardians, 3352 by individuals, 4485 by charity organization funds; 1643 cases were aided by loans, 6776 by grants in money; 918 were aided with employment, 83 to emigration, 1117 with hospital treatment, 1177 with surgical apparatus, 2783 with convalescent aid, 276 with pensions; 259 were admitted to homes; 1565 were aided as vagrants. Of the income of the society, £4845 was for general expenses at the central office, £11,380 for district committees; £244 was spent for emigration, £21,102 for special cases and pensions, £3752 for grants, and £408 for loans. The object of the society, it must be remembered, is not itself to give, but to aid the poor with friendly advice and by investigation to enable the wealthy to give wisely. It spends its money, therefore, first for workers, and only secondly and incidentally in giving money aid. Mr. C. S. Loch, the secretary of the society, estimates (*Charity Organization*, p. 43) that £4,719,224 were spent in charity in London in the year 1886-87 by all city, periodical, and voluntary institutions, besides £723,000 by hospitals.

The history of charity organization in the United States has closely followed that of England. In the fifties there had been organized in almost all the large cities relief societies, usually called Societies for the Improvement of the Condition of the Poor. The Boston Provident Association was one. They were often conducted in theory upon principles of modern charity, but in practice, says Mr. Kellogg, "they sank into the sea of common almsgiving, appealing to their patrons for support on the ground that the money given to them would enable them to enlarge the number of their beneficiaries or increase the amount of their gifts, and attracting the needy to their doors with the hope of loaves and fishes. . . . On every side the current of pub-

lic sentiment was that every penny spent in administration was so much abstracted from the poor, and that the best management was that which entailed the least cost in getting bread and soup to the hungry, and shelter, fuel, and clothing to the cold. . . . Legal relief consisted of outdoor and indoor systems, the latter being universally institutional, and therefore it only falls incidentally within the scope of charity organization efforts. The practice of outdoor relief differed greatly in different communities. In New York City the provision for this form of aid was comparatively slight, and consisted in appropriations for fuel distribution and for the adult blind in equal, inadequate amounts, and a trifling sum for medicines at the City Hospital. In some cities, like Buffalo, Philadelphia, and Brooklyn, large appropriations of money were made for outdoor relief, and its administration did not escape the suspicion of corrupt and political taint at times. In New England cities and town overseers of the poor or selectmen distributed, much at their caprice, the relief provided for by taxation. But from every quarter testimony arises that the system was without adequate safeguards of investigation, tests of destitution or means of hindering duplication of relief from several sources simultaneously, or of making the relief adequate to the necessity."

It was under such conditions that the movement toward charity organization commenced. Our account of the movement we abridge from the *Report of the Committee on History of Charity Organization in the United States, Made to the Twentieth National Conference of Charities and Correction (q. v.)*, Mr. Charles D. Kellogg, of the Charity Organization Society of New York City, being chairman. Says Mr. Kellogg:

"In 1874 the nearest approximation to charity organization to be found in the United States was the Chardon Street Building in Boston. It was erected in 1869 by joint contributions from the city and personal subscribers, in pursuance of a plan first promulgated by Hon. Robert C. Winthrop in 1857, and subsequently advocated in the annual reports of the Boston Provident Association, of which he was the president. Under its roof are the offices of the official boards and the principal voluntary relief societies of the city. The economy and advantages of proximity for the purpose of exchanging information and concerting measures of dealing with applicants for help had been clearly pointed out, and the existence of this building facilitated the subsequent systematic development of registration and cooperation in that city.

Beginnings.

"Altho the movement to organize charities in the cities of the United States everywhere traces its origin to the London Society and its publications, or to the discussions which arose concerning it, there were several independent centers in which it appeared nearly simultaneously in this country. In 1874 Rev. Charles G. Ames led in the formation, upon London models, of an association in Germantown, a suburban ward of Philadelphia, which employed household visitors to investigate applicants for aid, availed itself of the soup-houses, fuel societies, churches, and especially of the outdoor municipal relief in procuring the requisite assistance, and supplemented it as need indicated from its own resources. It brought the charitable operations of Germantown into unexpected unison; repressed imposture and the artificial appetite for aid of such poor as sought it only because they wanted to share in the good things provided for those who asked, and not because they would otherwise be destitute of them; reformed outdoor municipal relief; discovered real cases of hardship, and gained the confidence of the benevolent of all denominations in that community. This association profoundly influenced the measures adopted by the larger society formed in Philadelphia a few years later.

"In the same year a Bureau of Charities was formed in New York City, of which Mr. Henry E. Pellew was chief promoter and secretary, that proposed to register persons receiving outdoor relief, either from the city, benevolent societies, or individuals; but the scheme was frustrated the next year by the refusal of the largest relief-giving society in the city to cooperate. This plan met with better success in Boston. In the autumn of 1875 the Cooperative Society of Visitors among the Poor was formed in Boston, whose theater of operation was in the North End. The plan was a modification of the Elberfeld system as proposed by Octavia Hill for London. No visitor was to have more than four 'cases' on hand, and lists were obtained from the dispensary physicians of that congested and poor district. The society held weekly conferences of visitors and representatives of other

charities, and it opened a work-room in the Chardon Street Charity Building.

"Buffalo has the honor of being the first city in the United States to produce a complete Charity Organization Society of the London type. The Rev. S. H. Gurteen, an English clergyman, who had been active in the London Society, was settled as an assistant minister in St. Paul's Church there, and he systematized the work of his parish guild so that every application for aid was promptly investigated.

Various Cities.

He proposed in 1877 the creation of a clearing office to which the charitable agencies of the city should send daily reports, and he lectured on 'Phases of Charity,' attracting much attention. Simultaneously citizens, having met in conference, were engaged in an effort to reform the methods of municipal outdoor relief, which had become extravagant, was careless and corrupt. Failing to obtain legislation in Albany to create a commission for its control, they secured an ordinance from the city, under which, in October, 1877, all applications for relief were for the first time investigated by the police. On December 11, 1877, as a result of these agitations, the Charity Organization Society was set afoot at a public meeting, and it adhered to the principle of coordinating existing relief agencies and giving no relief from its own funds except in rare emergencies.

"In the spring of 1876 a Registration Committee was formed by private citizens of Boston, and work was begun in the autumn, carried on until the spring of 1878, and then abandoned in view of the larger enterprise then under discussion. It had demonstrated the value of reports from the offices of the overseers of the poor, of benevolent societies, and of the friendly visitors, when collated, but it had failed to obtain the entire cooperation of relief organizations. Much discussion and many conferences ensued during that year, looking to the formation of a society upon the principles of charity organization which would bring into association all the relief agencies, ecclesiastical and secular, of the city. The large relief societies knew the worth of registration, but doubted the value of 'friendly visiting.' They were willing to support the new movement, provided 'the visitors had no power of relief.' This condition was fortunately acceded to, and on February 26, 1878, a provisional commission was formed by delegates from many charities, which carried on the work until December 8, when the present constitution of the Associated Charities of Boston was adopted and went into effect.

"New Haven was next in line, May 23, 1878, with the cooperation of the older societies, and took charge of cases until investigation elicited some mode of making more permanent disposition of them.

"Philadelphia brought forward its type in 1878. In the previous autumn the officers of several soup societies, dissatisfied with the results of their previous work, called a public meeting of citizens to confer upon larger and better methods for the future. A large committee was appointed to draw up a plan, and on June 13, 1878, a constitution was adopted and a provisional organization set on foot. This instrument was dominated by the idea of reproducing in each of the 30 wards of the city a complete association like that existing in Germantown. The Central Board was to be composed of two delegates from each ward, which should meet monthly, and meanwhile its powers were to be exercised by an Executive Committee. The provisional commission proceeded to organize ward associations with great rapidity, and in due time delegates were chosen to the Central Board, and the society was organized under its constitution. The immediate results of so cumbersome and democratic a scheme was that 23 societies were formed in as many wards or groups of contiguous wards, pledged to take care of all the distress and penury each in its territorial limits. Each raised its own funds and disbursed them without control; and as there were but few persons in them who understood charity organization principles, the work often fell into wrong hands, and the ward associations were so many new almoning societies. By their attitude they were virtually saying to all the older charitable societies that there was no need of them, and they, as a rule, refused cooperation and still withhold it. Another result was that the Central Board had no authority to control the methods of relief, and was itself subordinate to its ward constituencies. One hundred and eighty persons were needed to fill the offices of directors, while there were large corps of visitors having a semi-independent organization. The movement was highly popular at the start, and came in the first year into an income of nearly \$40,000. It offered itself to the community as a

complete, independent, and self-contained system for dealing with every phase of charity, but its very sufficiency obscured the vital fact that charity organization aims at no more independence than is necessary to maintain existence, and should be subservient to all existing charity agencies with a view to their coordination. Great reliance for the uniform working of the system was placed upon monthly conferences of all the workers, directors, local superintendents, and visitors, and for a time these conferences were well attended and were highly educational. In due time the plan was revised, the choice of the Central Board was transferred from the ward associations to the annual meeting of the general society, its initiative and oversight was strengthened, and the wards were consolidated into 18 districts; but the original features had made a deep impression which has not been obliterated. The business of registration and cooperation sank into control of the district organizations; the Central Office drifted into the specialty of caring for non-residents and wayfarers' lodges; and the society remains, as it started out to be, a relief agency with charity organization traditions.

"Cincinnati was promptly in the field, November 18, 1879. The Associated Charities was initiated through influences aroused chiefly by the Women's Christian Association and other societies, the inaugural meeting being held the same hour with the first annual meeting of the Philadelphia society, and reciprocal congratulations being exchanged between them. It started avowedly on the lines laid down in the Boston society, but practically it fell into the Philadelphia methods, and created or adopted 12 district organizations dispensing relief, and which the Central Board was not able to control. Fortunately the tact and force of the general secretary repressed much of the mischief, secured a general registration, and gave cohesion to the system until 1886, when he resigned and the society lapsed into a relief agency, became unpopular, and was about to be abandoned, when, in 1889, it was reorganized, the district treasuries were absorbed into one, the central authority made dominant, and the distribution of relief was stopped, to the great increase of efficiency and public confidence.

"Brooklyn was another center where the movement arose spontaneously. In 1877 a commission of citizens undertook the investigation of outdoor relief, which in that year comprised 46,350 beneficiaries and involved an expenditure of \$741,207. This resulted in restricting municipal out-relief to coal in 1878, and in its total abolition the next year. In 1879 Mr. Seth Low, who had been providentially and unremediatedly present at the inauguration of the Buffalo society and deeply impressed thereby, enlisted Mr. Alfred T. White, and they, with others who had been instrumental in abolishing the outdoor relief of the city, together with the volunteer visitors of the out-poor, organized the Brooklyn Bureau of Charities, which does not give relief, but maintains wood-yards, laundries, work-rooms, and a woman's lodging-house.

"Indianapolis enjoyed the labors of Rev. Oscar C. McCulloch as president of the Benevolent Society, in which office he had made careful studies of the poor-relief problem. In 1876 Mr. King, the township trustee or overseer of the poor, began to systematize and improve the administration of poor relief, and together these gentlemen led on to the formation, December 5, 1879, of the Charity Organization Society.

"New York, as the largest center of population in the country, demands notice here. The difficulties encountered in securing influential cooperation in 1874 for a time paralyzed further effort, altho the necessity for some organization was long discussed by persons interested in charitable enterprises. In 1881 the matter was taken up by the State Board of Charities, and through its initiative the Charity Organization Society of the City of New York was founded in January, 1882, and incorporated on May 10 following. It followed the Boston plan in respect to the important features of giving no relief and of creating district associations maintained from a common treasury and under central control.

"All other charity organization societies in the United States trace their origin to these now enumerated, which have been selected not only as among the earliest in the field, but as illustrating the diversity of origin of the movement, the causes which immediately led to the associations for organizing charity, and the two types of societies, those which combine relief from their own funds with their methods and those which do not. The movement found an expression of its unity in the National Conference of Charities and Correc-

**National
Conference.**

tion, which is itself an outgrowth of the American Social Science Association. It is first mentioned in the proceedings of the Chicago Conference of 1879, where Mr. Seth Low presented a description of the work in Brooklyn, and a committee was formed to report upon charity organization. Two years later, at Boston, 19 societies reported to the National Conference, and the committee grew to a section, which published a separate report of its own proceedings.

Simultaneously with the beginning of charity organization, and promoted by the same men, there was a repression in important cities of official out-door relief. Returns from four cities for that time give the following results:

Suppression of Out-door Relief.

CITY.	Year.	Out-relief.	Year.	Out-relief.
Brooklyn	1877	\$141,207	1880	None.
Buffalo	1877	99,196	1880	\$37,868
Indianapolis, Center Township	1876	90,000	1880	8,000
Philadelphia	1879	66,000	1880	None.
Amount saved to taxpayers	359,533
Total	\$396,403	\$396,403

While this elimination of out-door relief was not pressed by formal action of our societies, charity organizationists claimed the credit of it as the result of their agitation and personal effort, and it was exactly in the line of the principles they advocated. Diligent inquiry showed that no suffering ensued in consequence of the withdrawal, while the admissions to almshouses and infirmaries in the cities named contemporaneously decreased. This event attracted wide attention in official and watchful circles, evinced the value of the investigations which preceded it, and disclosed the worse than useless prodigality of out-door relief. Its influence spread far and wide beyond the limits where it could be statistically followed, and was the beginning of a wiser administration of the charitable funds raised by taxation in many communities.

In 1882 there were 22 charity organization societies known to exist in the United States, and 10 others which had adopted some of the leading features of this movement and were enrolled as correspondents with the former societies. They embraced cities and towns having a population of 6,331,700, or 12 per cent. of the total of the United States, and among them were the chief centers of influence in the country.

So far, Mr. Kellogg. At present (1895) there are in the United States 120 charity organization societies existing under slightly different names and 21 relief societies which largely adopt charity organization principles. An appendix to Mr. Kellogg's report gives the following totals for 1892: Administrative officers, 763 men and 511 women; paid officers or agents, 77 men and 135 women; friendly visitors, 456 men and 354 women; branch or district organizations, 100; contributors, 15,726; churches or associations, 243. Received from city or State, \$17,877.54; income, \$263,421.39; invested funds, \$409,937.55. Concerning the lines of work developed, the report gives the following statistics:

Statistics.

REPRESSION.

Treatment of vagrants:
 Number turned over to police. 537 = 01%
 Number lodged through your society. 37,590 = 70.9%
 Number employed in wood-yard or other like test places. 13,760 = 26%
 Street beggars and impostors suppressed. 967 = 01.8%
 Fraudulent schemes detected. 117 = 00.2%

COOPERATION.

With municipal or State boards:
 Number in the town. 58
 Number cooperating. 56 = 97%
 With societies and their institutions:
 Number in the town. 1,443
 Number cooperating. 420 = 33%
 With churches:
 Number in town 3,113
 Number cooperating. 1,253 = 44%

SANITARY WORK:

- a. Tenements improved through landlords or through changed habits. 298
- b. Removals to better quarters. 112
- c. Open-air excursions, number of beneficiaries. 31,722

OTHER AGENCIES INAUGURATED AND MANAGED:

- Wood-yards. 7
- Sewing-rooms, laundries, banks, wayfarers' lodges, kitchens, etc. 25

Concerning the objects of methods of charity organization societies, Professor A. G. Warner, Ph.D., prints in his *American Charities* (pp. 380, 381) the following

table, adding that the first three objects may be described as the essential functions, the remaining five being usually kept in view, but not invariably so:

OBJECTS.	METHODS.	MACHINERY.
1. Cooperation between all charitable agencies of a given locality, and the best coordination of their efforts.	1. Comparison of relief records of the several agencies and mutual acquaintance of workers.	1. A card or other alphabetical catalogue of cases at a central office and frequent conferences of workers.
2. Accurate knowledge of all cases treated.	2. Thorough investigation, followed by careful registration.	2. Paid agents assisted by volunteer visitors, and elaborate case records either at central or branch offices.
3. To find prompt and adequate relief for all that should have it.	3. Bringing each case to the attention of appropriate relief agencies willing to aid.	3. Correspondence, personal interviews, sometimes a "Golden Book," or even a relief fund (wisdom of this last questioned).
4. Exposure of impostors and prevention of wilful idleness.	4. After investigation, notification in all cases of those likely to be deceived, and, where feasible, arrest of impostors and professional beggars. Work-test.	4. Paid agents, sometimes (especially for this work) publication of a "cautionary list," information to all asking for it in specific cases, wood-yard.
5. To find work for all able and willing to do anything.	5. To provide regular work where possible and relief work when necessary.	5. Employment agency, wood-yard, stone-breaking, laundries, rag-sorting, etc.
6. Establishment of relations of personal interest and sympathy between the poor and the well-to-do.	6. Friendly visiting.	6. Organization of corps of volunteer visitors who are not almsgivers, working under the guidance of paid agents.
7. Prevention of pauperism.	7. By above means and by special educational and provident schemes.	7. Kindergarten night schools, industrial schools, penny provident funds, provident dispensaries, fuel funds, etc.
8. Collection and diffusion of knowledge on all subjects connected with the administration of charities.	8. Discussion, public meetings, publication.	8. Board meetings, annual meetings, conferences, lecture courses, periodicals.

Besides this, or rather in connection with this general work, says Professor Warner (p. 391):

"Many organizations go further and seek to establish special branches likely to assail pauperism in its causes. The crèche, or day nursery, at which working mothers can leave their children during the day, has been established in several cities, notably in Buffalo. The kindergarten movement for poor children, or in connection with the public schools, has had the active assistance of charity organizationists. Cooking-schools, sewing-schools, trade-schools, and laundries for the education of the workers have been established, as well as different varieties of savings funds. Several of these funds operate with a system of stamp deposits, some of them being through collections made from house to house by the friendly visitors. The New York Society has been especially active in the pushing of stamp-deposit funds, having established 206 stations, with 26,732 depositors, and over \$15,000 on deposit. In Boston and Baltimore provident schemes of a similar character have been established, but not under the charity organizationists, the cooperating with them. Fuel funds, by means of which summer savings can secure winter delivery of coal at summer prices, have been established by some of the societies. The rule of nearly all the societies is not to undertake these special schemes if some independent organization can be found that will push them. They are desirable things that the charity organizationist wishes to see established, but they are not undertaken by the society itself except when necessary. Frequently such new enterprises start in connection with the society, and are then graduated into independent life." The report of Mr. Kellogg (1892) mentions penny savings funds controlled by the society in 17 cities and 18 provident funds.

The main work of the organization, however, is closely adhered to. Says a recent report of the Boston societies:

"Relief is not our business; help is. A friend in need is a friend indeed! But this must be a trained friend to become the best friend. And we find that,

just as lack of training is a large cause of poverty, so lack of training hinders and discourages our new volunteer visitors. The training comes more or less unconsciously; but it may be planned, as all training should be. The way to learn a business is to learn its details and their relations to principles. There is a right way of doing a thing, and there are more or less definite methods of going about the helping. The new visitor then must learn how. This is one of the reasons for organizing conferences. The conference is a body of volunteer visitors. Our purpose now is to speak more especially of parts of the conference—the Case Committee, the Daily Committee, and individual volunteer work, clerical or errands.

Method.

"The Case Committee is a committee of one or two persons to select the cases needing action, and present them concisely to the conference meeting for discussion and decision. One at least of this committee should be an expert; and by the concise manner in which the cases can be stated the visitors at the conference may learn much as to dealing with various classes of cases, and business may be despatched.

"The Daily Committee exists in some form in about half of our conferences. It consists of two or more persons at a time, changing generally from day to day, and seems likely to become the most active business committee of all, besides helping our visitors to learn. They may be all members of the Executive Committee or not. If not experts, they have in their work the means of becoming so. They consider promptly on the spot and from the latest information the new cases which have come in, or any which require immediate decision. They share with the agent the responsibility in such decisions, and may suspend or reverse, if necessary, decisions already made. They relieve the Case Committee from the press of accumulated work. They are on hand some part of every day in office hours with the (paid) agent. The conference is the final responsible legislative body, subject to the board of directors.

"While not yet a perfected system nor yet uniform, the above methods of work seem to be gaining acceptance as the best we can yet find for getting our work effectively done, and as affording an attractive means of learning how to be a good volunteer visitor and the best friend to the poor.

"It is interesting to notice in the statistics that the chief cause of need is sickness for 25 per cent., intemperance for 22 per cent., lack of employment for 14 per cent., and other causes far less."

In the larger cities directories of charities are published, embracing many hundred pages of lists, with brief notes of classified hospitals and relief societies, etc. In New York City a United Charities Building has been erected at a cost of over \$750,000, the gift of Mr. John S. Kennedy.

Charity organizations in the forms above described are mainly limited to England and the United States, but all civilized countries have societies acting more or less upon the same principles. The

Other Countries.

The Annual Report of the New York Society presents a list of foreign societies acting in cooperation with Charity Organization Societies whenever occasion requires. In this list Canada has 2 societies; Australia, 4; Austria, 9; Barbados, 1; Belgium, 2; Denmark, 1; Egypt, 1; France, 16; Germany, 28; Greece, 1; Holland, 3; India, 3; Italy, 7; Natal, 3; New Zealand, 1; Nova Scotia, 1; Russia, 4; Spain, 2; Sweden and Norway, 2; Switzerland, 3; Tasmania, 1; Turkey, 1. Charitable aid in the different countries is, however, administered in quite various ways. In Italy it is almost wholly conducted by religious orders and societies; in France there is a system which combines voluntary effort and official management. Says the Rev.

France.

L. R. Phelps in Palgrave's *Dictionary of Political Economy*: "The right to relief is recognized only in the cases of lunatics and deserted children; all other relief

may be described as organized charity distributed by public bodies. Institutions, such as *Hospitaux* for the sick, hospices for the aged and infirm, are supported by endowments and voluntary contributions, and managed by unpaid bodies constituted and controlled by the State. The *Bureaux de Bienfaisance*, consisting of elected and nominated members, the mayor presiding *ex officio*, distribute relief in the commune to the poor at their own homes. The funds which they administer are derived almost wholly from endowments and voluntary contributions, a small proportion only coming from taxation. Inquiry is conducted mainly by Sisters of Charity, and is very thorough."

German charity organization is noteworthy for the development of the Elberfeld system (*q.v.*); according to this system the city is divided by the municipal authorities into districts, over each of which districts an overseer is appointed with 14 or more visitors under him.

Germany.

These visitors investigate and report upon each application for relief. Meetings of the visitors with the overseer are held fortnightly, and records of all cases are made and transmitted to a central board or *Verwaltung*. The rules of the system and the instructions given to the visitors are very minute. Funds are raised by special and general taxation. All the officers and visitors are unpaid, and are appointed by the council, service being in practice almost obligatory. Voluntary societies are expected to work in connection with the municipal system, and the plan is said to meet with great success.

OBJECTIONS TO CHARITY ORGANIZATIONS.

Charity Organization Societies are criticised by many, especially by the leaders of the so-called labor movement. The ground of this criticism is often, however, a hostility to the general social and industrial conditions out of which the associated charity movement has grown, rather than an intelligent criticism of the movement itself. It is charged by these critics that the associated charities often keep even those applicants who are worthy waiting, tossed from this bureau to that, while their case is being investigated, analyzed, and finally referred to the proper bureau. It is said that the investigation of cases by men and women who, however kindly may be their intentions, often

do not understand the industrial and economic condition of the poor, leads to repeated cases of injustice, as these visitors try to distinguish between those whom they consider deserving and the undeserving. The working classes often resent this investigation of their family life that seems to them either an insulting espionage or a patronizing condescension from the rich. These labor critics assert, too, that the associated charities, by becoming, as it were, professional almoners for the rich, really prevent the natural contact of the rich with the poor, and dry up the flow of charity in a system of suspicion and of red tape. Above all, these critics assert that the associated charities, by their constant effort to make the poor self-supporting and self-dependent, hold out a false and reactionary standard of individualism which is impossible of fulfilment and yet which blinds the community to the real economic trouble. It is argued that many of the poor to-day cannot get employment, and therefore that it is idle and insulting for the associated charities to be forever bidding the individual to find work for himself when this is just what he wants to do and cannot. The need to-day, say these critics, is for such changes in the social condition that all shall have work and not need alms, and the charity organizations prevent these changes by teaching that the poor can to-day help themselves. For rich people who are living off the work of the poor to organize societies to bid the poor be self-supporting is from this standpoint an insult and absurdity. It will be thus seen that the real opposition to the associated charities springs from a sense of the injustice of the present system. What is wanted, say these critics, is not associated charity, but associated justice. The answer to this criticism is that the associated charities are not responsible for the present system, be it just or unjust, but that under the present system they are striving to aid the poor in what experience shows to be at present the wisest way. To the assertion that they keep the poor waiting while they are being investigated, it is answered that the records of the society prove this charge unsupported. Undoubtedly no system always works well, and among the hundreds and thousands of charity visitors, unwise and foolish things are no doubt occasionally done and needless suffering caused, but it is proved that this happens very rarely and that the system is working better and better.

Answer to Objections

Nevertheless many even of the firmest friends of charity organization are admitting that charity in any form cannot meet the real needs of the poor to-day, and that therefore just so far as associated charities make the wealthy and influential believe that deeper social reforms are not needed, associated charities do become reactionary and harmful. President Tucker said, in a recent Phi Beta oration at Harvard: "The philanthropy which is content to relieve the sufferer from wrong social conditions postpones the philanthropy which is determined, at any cost, to right those conditions." Associated charities are not righting the conditions. In an address at the Episcopal Church Congress, in Boston, November, 1894, Mr. Robert Treat Paine, one of

the foremost associated charity leaders in America, said, speaking of the conditions in the larger cities: "The day of panaceas is gone. . . . All that I can do is to utter my cry almost of despair." In England, says another charity organization worker, the Rev. S. A. Barnett (*Practicable Socialism*, p. 66):

"The most earnest member of a charity organization cannot hope that organized alms giving will be powerful so to alter conditions as to make the life of the poor a life worth living. Societies which absorb much wealth and which relieve their subscribers of their responsibility are failing; it remains only to adopt the principles of the education act, of the poor law, and of other socialistic organization, and call on society to do what societies fail to do."

Nevertheless, it does not follow, even if Canon Barnett be right, that while we press toward new social reforms, we should not do all we can to relieve by wise charity the suffering of the poor to-day.

Revised by CHARLES D. KELLOGG.

CHAUTAUQUA ASSEMBLY.—In August, 1874, Lewis Miller, of Akron, O., and Bishop John H. Vincent organized the first Chautauqua Assembly. Its name was derived from Chautauqua Lake, in New York State, on the shore of which the meeting was held. It began as a summer school for the better training of Bible teachers, and endeavored to lay most emphasis on the "week-day forces" in religious culture. Its two founders desired to give Sunday-school teachers a continued, progressive, and thorough study of biblical literature and pedagogical principles. The first meeting was a success; and by a gradual and natural growth the plan has been broadened to include instruction in almost all branches of knowledge; the session has been extended from two weeks to two months (July and August); and a town has been built up which presents an interesting study to the educator and sociologist in its municipal government and its ideals of life. The present form of the Chautauqua Assembly was assumed in 1878, and various improvements have been adopted from year to year. It is at present incorporated under the laws of the State of New York. Its management is intrusted to a board of 24 trustees, elected either by the owners of property at Chautauqua, or in case a quorum of such electors cannot be secured, by the board itself. The Assembly is not a stock company, nor are the trustees interested in the land beyond the ownership of lots for private use. By the provisions of the charter, all surplus funds must be used for the improvement and extension of the Assembly's work. The president and chancellor have never received compensation for their services. Those officers upon whom falls the management of details are paid ordinary salaries.

Chautauqua has become a city where municipal functions are extended to include free public instruction and entertainment. This expense is defrayed by a system of taxation which falls upon all within the town, however brief the term of citizenship. The tariff for July is: one day, 25 cents; one week, \$1; the month, \$2.50; for August: one day, 40 cents; one week, \$2; the month, \$3; the charge for the entire season, \$5. Citizenship includes the privilege of attending all exercises of the general program, and access to the museum, the reading-room, the models, etc.

Chautauqua is distinctively a religious place in the broadest sense, embracing the higher mental, physical, and spiritual development of its citizens and members. It is strictly non-sectarian.

The general program provides a daily arrangement of lectures, concerts, dramatic recitals, and other exercises, to which all citizens have free access. Every evening a fine concert, a stereopticon lecture, or some other entertainment is given. Well-known men and women in all departments of life give courses of lectures or single addresses on contemporary religious, social, and economic questions. For those who wish to study, a six weeks' course of instruction is provided at moderate charges: (a) Chautauqua College, teaching ancient and modern languages, literature, history, natural sciences, political economy, and philosophy. (b) Schools of sacred literature, providing courses in Bible study, both in the original languages and in English, under leading biblical specialists. (c) A pedagogical course for public-school teachers extends over a period of three weeks, and includes instruction in psychology, pedagogical principles, and their practical application to the teaching of arithmetic, geography, science, etc. (d) A school of music, teaching both the theory and practice of instrumental and vocal music. (e) A school of physical education in connection with a well-equipped gymnasium, conducting classes for both sexes in all branches of gymnastics, athletic contests, rowing, etc. (f) Other classes in art, photography, industrial drawing, china decoration, manual training, elocution, and short-hand.

A daily paper, the *Chautauqua Assembly Herald*, is published. Besides the regular classes, there have been formed a number of clubs for various special educational purposes.

One of the most important features of the Assembly is the Chautauqua Literary and Scientific Circle. This was started in 1878, and offers aid to self-educating people, either as individuals or in groups known as "local circles." The essential features of the plan are:

1. A definite four years' course of history, literature, science, etc.
2. Specified volumes approved by the counselors.
3. Allotment of time. Reading apportioned by week and month.
4. A monthly magazine with additional readings, notes, and general literature.
5. A membership book, with suggestions, review outlines, etc.
6. Time required, 40 minutes to an hour a day for nine months.
7. Certificates granted to all who complete the four years' course.
8. Advanced courses, for continued reading in special lines.
9. Pedagogical course for secular teaching.
10. Young People's Reading Course to stimulate the reading of good literature by the young.

Further details may be obtained from Bishop Vincent, Buffalo, N. Y. At present (1895) the Chautauqua Literary and Scientific Circle has enrolled over 200,000 members, and an endeavor is being made to establish a "resident faculty for non-resident students." The officers of Chautauqua (1895) are: President,

CHERBULIEZ, ANTOINE ELYSÉE, was born in Geneva in 1797. A barrister, magistrate, and then professor, he was in the Cantonal Legislature from 1831 to 1846, and till 1848 in the Great Council. From 1848 to 1851 he was in Paris, and then professor at Zurich, where he died 1869. His main work is *Précis de la Science économique et de ses principales applications* (2 vols., 1862).

CHEVALIER, MICHEL, was born at Limoges in 1806, and died at the Château de Montplaisir, near Lodève (Hérault), in 1879. Commencing life as a mining engineer, he gave this up in 1829 to join Saint-Simonism (*q.v.*), and became editor-in-chief of the *Globe*. He was condemned, August 28, 1832, to a year's imprisonment and 100 francs (£4) fine, as the responsible agent of the *Globe*, for articles which were accused of being outrages on morality. His intentions were worthy, and his habits of life more strict than appearances led the world to suppose; hence the Government itself, which discovered at this time M. Chevalier's abilities, remitted half the penalty, and also entrusted to him the mission of studying the railways of the United States. He devoted himself henceforward to writing on engineering and economic subjects, and gradually but very materially changed his economic views. In 1841 he succeeded Rossi in the chair of Political Economy at the College of France.

In the Revolution of 1848 he opposed the socialism of the *Commission du gouvernement pour les travailleurs*. He wrote at that time in the *Journal des Débats* a series of letters called *Lettres sur l'organisation du travail*, which were collected under this title. This and the *Lettres sur l'Amérique du nord* may be considered his most characteristic and remarkable works.

The Institut (*Académie des Sciences morales et politiques*) opened its doors to him February, 1851. At the end of that year he gave in his adhesion to the Government of the *coup d'état*. He believed liberty to be more in peril under the class of parliamentary government of which he had seen the working, than under a personal government. He was called to the council of state February, 1852. At the same date M. Chevalier published the *Examen du système commercial connu sous le nom de système protecteur*, a work in which the advantage of commercial liberty was shown. He induced Napoleon III. to sign the famous commercial treaty with England of January 23, 1860.

In 1859 Michel Chevalier published a new volume with the significant title, *De la baisse probable de l'or*. Facts have shown him wrong on this point. He strove later against Louis Wolowski in favor of the single gold standard against the system of a double standard combined with a fixed ratio. He resumed his duties as professor in 1866 and carried them on till 1878, when he took a coadjutor—this time one of his sons-in-law—M. Paul Leroy-Beaulieu, who became his successor. (Abridged from the account by M. A. Courtois, *fils*, in Palgrave's *Dictionary of Political Economy*.)

CHICAGO ANARCHISTS, THE.—The arrest, trial, and execution of the so-called "Chicago anarchists" mark an epoch in the development of the labor movement in America. The facts of the case, gathered out of the somewhat contradictory statements made by those who believe that the anarchists were rightly, and those who believe that they were wrongly condemned seem to be as follows:

The year 1886 was one of widespread social industrial agitation in the United States. In 1884, the Federation of Trades and Labor Unions of the United States and Canada had issued a manifesto calling on all trades to unite in the demand for an eight-hour day, and setting a day for a general strike to gain that end. Afterward it was deemed wisest to postpone concerted action for one year, and May 1, 1886, was the day appointed when the new system should be inaugurated. All through the States the wave of organization spread, men and women of advanced ideas all lending their aid to further the movement.

History.

In Chicago the excitement ran the highest. Here was a little group of men more or less loosely banded together, and popularly called anarchists. As a matter of fact, they were of various economic views. They gathered around a section of the American International, which had become an anarchistic organization, and must not be confused with the old European socialist International. They had two principal organs: the *Alarm*, with Parsons as its editor, the English organ, and the *Arbeiter Zeitung*, the German organ, with Spies and Schwab as its principal writers, and Fischer as foreman. Fielden and Engel were also prominent in the group. Not agreed in their economic views, they were agreed in denouncing the present system as the parent of cruel wrongs, and in being willing to go to extremes in agitating against this system.

They felt that the labor movement was dying of inertia. They felt that the working people were being utterly ground down, and were submitting too easily. They thought that, without really committing violence, if they threatened violence and "talked" murder and dynamite, they could frighten the capitalists into either valuable concessions, or such a policy of restriction as would make the people rise. They therefore began in the *Alarm* to write incendiary articles; and in order to frighten the capitalists, they reported the working people as preparing to rise in vengeance. Some of them, at least, believed that by "talking violence" they would "really prevent violence." They argued that "if it did cost a little bloodshed now," it would "save bloodshed in the end." Some of them were themselves the gentlest of men. (For their individual lives, see the end of this article.)

The eight-hour movement gave the anarchists opportunity for agitation. An eight-hour association was formed in Chicago. Open-air meetings were continually held. Bitterest language was used. On their side, the employers drew closer together against the movement. Some firms, however, granted some reduction of hours. At McCormick's reaper works there was a prolonged struggle, commencing in February, and continuing many months. The master tried to force his men out of their organizations. Twelve hundred men were thrown out of work. On May 1, 40,000 men and women struck work in Chicago for the eight-hour day. The Central Labor Union of Chicago held a mass-meeting attended by 25,000 people. Spies, Parsons, Fielden, and Schwab spoke. Strikes spread still further. On May 2 a great meeting of the locked-out men from McCormick's was held to protest against the Pinkertons he employed.

Parsons and Schwab spoke at the meeting. Among the strikers were the lumber-shovers, most of them Poles, Bohemians, and Germans. May 3, the Lumber-Shovers' Union called a meeting to discuss the terms of proposals to be submitted to their employers. The meeting was held near McCormick's. Spies, being known as a good speaker, was invited to attend. When he appeared, a protest was heard against letting a socialist speak. But Spies began, and was soon listened to in quiet. At four o'clock the bell of McCormick's began to ring, and the "scabs" were seen leaving. Some of the by-standers at the meeting then made a move toward the factory, while Spies went on quietly with his speech

The Strike.

for another 15 minutes. The crowd outside the factory began throwing stones. The police were telephoned for, and arrived in large numbers. They were received with stones, and replied with their revolvers. A few shots were returned by the crowd, and the police opened a general fire upon all in sight—men, women, and children, who fled in terror, leaving four dead and many wounded. Burning with indignation, Spies rushed back to the *Arbeiter Zeitung* office and wrote a manifesto, the so-called "Revenge Circular." This was distributed at the different workmen's meeting-places.

Among the many meetings that took place the same night was one of the socialist association, the Lehr und Wehr Verein. Gottfried Waller, who turned informer afterward, was elected chairman. Engel and Fischer were present. The events of the afternoon at McCormick's were discussed, and also in a general way what the working men were to do if the police went on attacking strikers. It was resolved to call a meeting the following night in the Haymarket to protest against the police assaults. The next morning, May 4, Fischer informed Spies, at the *Arbeiter Zeitung* office, of the proposed meeting, and asked him to speak; he consented. Shortly afterward he saw, for the first time, the circular calling the meeting, which contained the words, "Working men, arm yourselves, and appear in full force." Immediately on reading the circular Spies said that this must be struck out, or he would not speak or attend the meeting. Fischer at once agreed, and had the line taken out. The circular with that line omitted was printed, and about 20,000 copies distributed.

Parsons had been away from Chicago to Cincinnati, from Sunday, May 2, and returned Tuesday morning. His wife asked him to help her in organization of the sewing girls of Chicago, and Parsons, knowing nothing of the Haymarket meeting, then called a meeting of the American group at the *Arbeiter Zeitung* office. In the evening Spies went to the Haymarket, but seeing no English speakers, went away, with a few friends, to find Parsons; but soon returned, without having found him, and opened the meeting.

Meantime, a few members of the American group had assembled at the *Arbeiter Zeitung* building. There were Fielden, Schwab, and at about 8.30 o'clock Parsons arrived, in company with Mrs. Parsons, his two children, and Mrs. Holmes. Schwab soon left to address a meeting at Deering. Schwab stayed at Deering until 10.30 o'clock. The discussion on the girls' movement was soon over,

The Riot.

when somebody arrived from the Haymarket, stating that English speakers were wanted. Parsons, with his company, Fielden, and most of those present, at once went there. On their arrival Spies ceased speaking, and Parsons got up and spoke about one hour. The meeting was a quiet one, and at the close of Parsons' speech, the Mayor of Chicago, who attended the meeting for the purpose of dispersing it, if need should arise, left the meeting and went over to the police station, and told Captain Bonfield that he had better issue orders to his reserves at the other stations to go home. Parsons was followed by Fielden. When he had been speaking some 10 minutes the weather clouded, and the wind blowing cold, Parsons suggested that they had better adjourn to Zepf's Hall, close by; Fielden said he would be through in a few minutes. Many left the meeting, among them Parsons, with his family; they crossed to Zepf's Hall, where they found Fischer. Fielden went on speaking, when suddenly about 180 police turned out of the station, marching with a quick step, in fighting formation, and with arms in readiness, to the Haymarket, where only a few hundred persons remained. The captain of the first row of the police had just ordered the meeting to disperse, and his men, without waiting a reply, were advancing to the attack, when a small bomb was thrown by some one, alighted between the first and second companies of the police, and exploded with a loud report. About 60 of the police were thrown to the ground, and one, named Matthias J. Degan, was killed. Instantly firing began; people fled terrified in all directions, followed by the police, who fired at random as they followed.

The Haymarket speakers, except Parsons, who had left Chicago, were arrested; those who had taken a prominent part in labor meetings, and were known as labor organizers, were hunted and imprisoned. The *Arbeiter Zeitung* was suppressed, and all its printers and editors put in jail. When the friends of the arrested men tried to restart it, it had to pass under the censorship of the chief of police. The meetings of workmen were prohibited or broken up. The most exciting tales about infernal conspiracies against the

life and property of the citizens were circulated. The daily papers called for the hanging of the leading anarchists, as if they had been already proved guilty.

After the Haymarket meeting, May 4, 1886, some 300 leading American capitalists met secretly to plan the destruction of anarchy. They formed themselves into The Citizens' Association, and subscribed \$100,000 in a few hours.

On May 17 the grand jury came together. "The body is a strong one," says a telegram from Chicago to a New York daily, "and it is safe to aver that anarchy and murder will not receive much quarter at the hands of the men composing it. It is certain that Spies, Parsons, Schwab, and the other inciters to outrage will be indicted." Indicted they were. The indictment contained 69 counts, charging the defendants, August Spies, Michael Schwab, Samuel Fielden, Albert R. Parsons, Adolph Fischer, Georg Engel, Louis Lingg, Oscar W. Neebe, Rudolph Schnaubelt, and William Seliger with the murder of M. J. Degan. Schnaubelt and Parsons were not in the hands of the police, but when the trial came on Parsons presented himself at the bar of the court. Seliger had turned informer. On June 21 the impaneling of the jury before Judge Joseph E. Gary began. About 1000 were examined. Of this number only five or six belonged to the labor class, and they were all challenged and refused by the State. The remainder were all employers of labor, or men dependent upon that class, as clerks or the like. Most declared they had a prejudice against anarchists, socialists, and communists as a class. This, however, Judge Gary ruled, was no cause to exclude them from the jury. On the motion for a new trial, an affidavit was produced wherein it was sworn that the special bailiff, Henry Rye, had said to well-known men in Chicago that he was managing this case, and well knew what he was about; that those fellows would hang as certain as death, and that he was only summoning such men as jurors as would not be acceptable to the defendants.

The Trial.

The impaneling of the jury occupied 22 days. On July 15 State's Attorney Grinnell began his address, charging the defendants with murder and conspiracy, and promising to show the jury who threw the bomb.

The most important witnesses for the State were Waller, Schrader, and Seliger, all formerly comrades of the defendants, now turned informers. The theory for the prosecution was that the defendants were, with others, actively engaged in a conspiracy to overturn the existing authorities, and advocated bloodshed and violence in order to gain their ends, and that the meeting on May 4 in the Haymarket was only one step in their program. The evidence brought forward to support such a theory was, however, extremely contradictory, and much of it broke down completely on the first examination. It was never proven who threw the bomb, and, as some of the men indicted were not at the Haymarket meeting, and had nothing to do with it, the prosecution was forced to proceed on the theory that the men indicted were guilty of murder because it was claimed they had at various times in the past uttered and printed incendiary and seditious language, practically advising the killing of policemen, of Pinkerton men, and others acting in that capacity, and that they were therefore responsible for the murder of Matthias Degan. Said Judge Gary:

"If the fact be that a large number of men concurred with each other in preparing to use force for the destruction of human life, upon occasions which were not yet foreseen, but upon some principles which they substantially agreed upon, as, for example, taking the words of this witness, if a large number of men agreed together to kill the police if they were found in conflict with the strikers

The Prosecution.

—I believe that is the phrase—leaving it to the agents of violence to determine whether the time and occasion had come for the use of violence; then, if the time and occasion do come when the violence is used, are not all parties who agreed beforehand in preparing the means of death, and agreed in the use of them upon time and occasion, equally liable?"

The prisoners argued in defense that, as some unknown person threw the bomb, it was impossible to know beyond a reasonable doubt that he had been led to do it by any public speech of theirs or any editorial they had published. They also claimed that to punish them because of the effect of any public speech they had delivered or any newspaper article they had written or published would be a violation of the law that forbids any abridgment of speech or press in the United States. The prisoners had counsel, but also defended

themselves in speeches rather of defiance than defense.

After a prolonged trial the jury brought in the verdict:

"We, the jury, find the defendants August Spies, Michael Schwab, Samuel Fielden, Albert R. Parsons, Adolph Fischer, George Engel, and Louis Lingg guilty of murder in manner and form as charged in the indictment, and fix the penalty at death. We find the defendant Oscar W. Neebe guilty of murder in manner and form as charged in the indictment, and fix the penalty at imprisonment in the penitentiary for 15 years."

The case was carried to the Supreme Court, and was there affirmed in the fall of 1887. November 10 Lingg committed suicide by exploding a bomb in his mouth. The sentence of Fielden and Schwab was commuted to imprisonment for life, and Parsons, Fischer, Engel, and Spies were hanged November 11, 1887. They suffered calmly and without flinching. Parsons' last words were, "Let the voice of the people be heard."

The hanging excited great agitation over all the world. The major part of the daily press and of the capitalist community welcomed it as a necessary stamping out of anarchy in this country. On the other hand, many thoughtful men, including judges, lawyers, clergymen, and others, while expressing dissent from all sympathy with anarchists, declared their belief that the trial had not been a fair one. By the whole world of labor the anarchists were lauded as martyrs to the cause of labor and of liberty, and their trial and hanging denounced as an outrage upon justice and upon freedom. Mrs. Parsons went through all the land lecturing to crowded audiences. Anarchism was made almost popular among many classes. Every year anarchists and the more radical socialists and labor reformers of all schools of thought, who will unite on no other occasion, meet on both sides of the Atlantic to commemorate the hanging of "the Chicago martyrs."

In June, 1893, the recently elected Democratic Governor of Illinois, John P. Altgeld, having thoroughly examined the evidence, pardoned Neebe, Fielden, and Schwab, on the ground that they had not been fairly tried.

As is well known, public opinion is divided on this subject. We give a synopsis of Governor Altgeld's published argument for believing the trial not to have been a fair one, and then a synopsis of Judge Gary's statement upon the other side.

Says Governor Altgeld in substance:

"The several thousand merchants, bankers, judges, lawyers, and other prominent citizens of Chicago who have by petition, by letter, and in other ways urged executive clemency, mostly base their appeal on the ground that, assuming the prisoners to be guilty, they have been punished enough, but a number of them who have examined the case more carefully, and are more familiar with the record and with the facts disclosed by the papers on file, base their appeal on entirely different grounds. They assert:

"1. That the jury which tried the case was a packed jury selected to convict.

"2. That according to the law as laid down by the Supreme Court, both prior to and again since the trial of this case, the jurors, according to their own answers, were not competent jurors, and the trial was therefore not a legal trial.

"3. That the defendants were not proven to be guilty of the crime charged in the indictment.

"4. That as to the defendant Neebe, the State's attorney had declared at the close of the evidence that there was no case against him, and yet he has been kept in prison all these years.

"5. That the trial judge was either so prejudiced against the defendants, or else so determined to win

the applause of a certain class in the community, that he could not and did not grant a fair trial.

"Upon the question of having been punished enough, I will simply say that, if the defendants had a fair trial, and nothing has developed since to show that they are not guilty of the crime charged in the indictment, then there ought to be no executive interference, for no punishment under our laws could then be too severe. Government must defend itself; life and property must be protected, and law and order must be maintained; murder must be punished, and if the defendants are guilty of murder, either committed with their own hands, or by some one else acting on their advice, then, if they have had a fair trial, there should be, in this case, no executive interference. The soil of America is not adapted for the growth of anarchy. While our institutions are not free from injustice, they are still the best that have yet been devised, and therefore must be maintained.

"The record of the trial shows that the jury in this case was not drawn in the manner that juries usually are drawn; that is, instead of having a number of names drawn out of a box that contained many hundred names, as the law contemplates shall be done in order to insure a fair jury and give neither side the advantage, the trial judge appointed one, Henry L. Ryce, as a special bailiff to go out and summon such men as he, Ryce, might select to act as jurors. While this practice has been sustained in cases in which it did not appear that either side had been prejudiced thereby, it is always a dangerous practice, for it gives the bailiff absolute power to select a jury that will be favorable to one side or the other."

The judge then gives the evidence, and says:

"Upon the whole, therefore, considering the facts brought to light since the trial, as well as the record of the trial and the answers of the jurors as given therein, it is clearly shown that while the counsel for defendants agreed to it, Ryce was appointed special bailiff at the suggestion of the State's attorney, and that he did summon a prejudiced jury which he believed would hang the defendants, and further, that the fact that Ryce was summoning only that kind of men was brought to the attention of the court before the panel was full, and it was asked to stop it, but refused to pay any attention to the matter, but permitted Ryce to go on, and then forced the defendants to go to trial before this jury.

"While no collusion is proven between the judge and State's attorney, it is clearly shown that after the verdict, and while a motion for a new trial was pending, a charge was filed in court that Ryce had packed the jury and that the attorney for the State got Mr. Favor to refuse to make an affidavit bearing on this point, which the defendants could use, and then the court refused to take any notice of it unless the affidavit was obtained, altho it was informed that Mr. Favor would not make an affidavit, but stood ready to come into court and make a full statement if the court desired him to do so.

"These facts alone would call for executive interference, especially as Mr. Favor's affidavit was not before the Supreme Court at the time it considered the case.

"The second point urged seems to me to be equally conclusive. In the case of the People v. Coughlin, known as the Cronin case, recently decided, the Supreme Court, in a remarkably able and comprehensive review of the law on this subject, says among other things:

"The holding of this and other courts is substantially uniform, that where it is once clearly shown that there exists in the mind of the juror at the time he is called to the jury box a fixed and positive opinion as to the merits of the case, or as to the guilt or innocence of the defendant he is called to try, his statement that, notwithstanding such opinion, he can render a fair and impartial verdict according to the law and evidence, has little, if any, tendency to establish his impartiality. This is so because a juror who has sworn to have in his mind a fixed and positive opinion as to the guilt or innocence of the accused is not impartial, as a matter of fact. . . .

"It is difficult to see how, after a juror has avowed a fixed and settled opinion as to the prisoner's guilt, a court can be legally satisfied of the truth of his answer that he can render a fair and impartial verdict, or find therefrom that he has the qualification of impartiality, as required by the Constitution. . . .

"Applying the law as here laid down in the Cronin case to the answers of the jurors above given in the present case, it is very apparent that most of the jurors were incompetent, because they were not impartial,

Gov. Altgeld's Statement.

Was the Jury Packed?

for nearly all of them candidly stated that they were prejudiced against the defendants, and believed them guilty before hearing the evidence; and the mere fact that the judge succeeded by a singularly suggestive examination in getting them to state that they believed they could try the case fairly on the evidence did not make them competent. . . .

"No matter what the defendants were charged with, they were entitled to a fair trial, and no greater danger could possibly threaten our institutions than to have the courts of justice run wild or give way to popular clamor; and when the trial judge in this case ruled that a relative of one of the men who was killed was a competent juror, and this after the man had candidly stated that he was deeply prejudiced and that his relationship caused him to feel more strongly than he otherwise might, and when in scores of instances he ruled that men who candidly declared that they believed the defendants to be guilty; that this was a deep conviction and would influence their verdict, and that it would require strong evidence to convince them that the defendants were innocent, when in all these instances the trial judge ruled that these men were competent jurors simply because they had, under his adroit manipulation, been led to say that they believed they could try the case fairly on the evidence, then the proceedings lost all semblance of a fair trial.

"The State has never discovered who it was that threw the bomb which killed the policemen, and the evidence does not show any connection whatever between the defendants and the man who did throw it. The trial judge in overruling the motion for a new hearing, and again, recently, in a magazine article, used this language:

"The conviction has not gone on the ground that they did have actually any personal participation in the particular act which caused the death of Degan, but the conviction proceeds upon the ground that they had generally by speech and print advised large classes of the people, not particular individuals, but large classes, to commit murder, and had left the commission, the time and place and when to the individual will and whim, or caprice, or whatever it may be, of each individual man who listened to their advice, and that in consequence of that advice, in pursuance of that advice and influenced by that advice, somebody not known did throw the bomb that caused Degan's death. Now, if this is not a correct principle of the law, then the defendants of course are entitled to a new trial. This case is without precedent; there is no example in the law books of a case of this sort."

"The judge certainly told the truth when he stated that this case was without a precedent, and that no example could be found in the law books to sustain the law as above laid down. For, in all the centuries during which government has been maintained among men and crime has been punished, no judge in a civilized country has ever laid down such a rule before. The petitioners claim that it was laid down in this case simply because the prosecution, not having discovered the real criminal, would otherwise not have been able to convict anybody; that this course was then taken to appease the fury of the public, and that the judgment was allowed to stand for the same reason. I will not discuss this. But taking the law as above laid down, it was necessary under it to prove, and that beyond a reasonable doubt, that the person committing the violent deed had at least heard or read the advice given to masses, for until he either heard or read it he did not receive it, and if he did not receive it, he did not commit the violent act in pursuance of that advice, and it is here that the case for the State fails; with all his apparent eagerness to force conviction in court, and his efforts in defending his course since the trial, the judge, speaking on this point in his magazine article, makes this statement: "It is probably true that Rudolph Schnaubelt threw the bomb," which statement is a mere surmise and is all that is known about it, and is certainly not sufficient to convict eight men on. In fact, until the State proves from whose hands the bomb came, it is impossible to show any connection between the man who threw it and these defendants. . . .

"Again it is shown that various attempts were made to bring to justice the men who wore the uniform of the law while violating it, but all to no avail; that the laboring people found the prisons always open to receive them, but the courts of justice were practically closed to them; that the prosecution officers vied with each other in hunting them down, but were deaf to their appeals; that in the spring of 1886 there were more labor disturbances in the city, and

particularly at the McCormick factory; that under the leadership of Captain Bonfield the brutalities of the previous year were even exceeded. Some affidavits and other evidence is offered on this point which I cannot give for want of space. It appears that this was the year of the eight-hour agitation, and efforts were made to secure an eight-hour day about May 1, and that a number of laboring men standing, not on the street, but on a vacant lot, were quietly discussing the situation in regard to the movement, when suddenly a large body of police, under orders from Bonfield, charged on them and began to club them; that some of the men, angered at the unprovoked assault, at first resisted, but were soon dispersed; that some of the police fired on the men while they were running and wounded a large number who were already 100 feet or more away, and were running as fast as they could; that at least four of the number so shot down died; that this was wanton and unprovoked murder, but there was not even so much as an investigation.

"While some men may tamely submit to being clubbed and seeing their brothers shot down, there are some who will resent it, and will nurture a spirit of hatred and seek revenge for themselves, and the occurrences that preceded the Haymarket tragedy indicate that the bomb was thrown by some one who, instead of acting on the advice of anybody, was simply seeking personal revenge for having been clubbed, and that Captain Bonfield is the man who is really responsible for the death of the police officers.

"It is also shown that the character of the Haymarket meeting sustains this view. The evidence shows there were only 800 to 1000 people present, and that it was a peaceable and orderly meeting; that the mayor of the city was present, and saw nothing out of the way, and that he remained until the crowd began to disperse, the meeting being practically over, as the crowd engaged in dispersing when he left; that had the police remained away for 20 minutes more there would have been nobody left there, but that as soon as Bonfield learned that the mayor had left, he could not resist the temptation to have some more people clubbed, and went up with a detachment of police to disperse the meeting, and that on the appearance of the police the bomb was thrown by some unknown person, and several innocent and faithful officers, who were simply obeying an uncalled-for order of their superior, were killed. All of these facts tend to show the improbability of the theory of the prosecution that the bomb was thrown as the result of a conspiracy on the part of the defendants to commit murder. If the theory of the prosecution were correct, there would have been many bombs thrown; and the fact that only one was thrown shows that it was an act of personal revenge.

"It is further shown here that much of the evidence given at the trial was a pure fabrication; that some of the prominent police officials in their zeal not only terrorized ignorant men by throwing them into prison and threatening them with torture if they refused to swear to anything desired, but that they offered money and employment to those who would consent to do this. Further, that they deliberately planned to have fictitious conspiracies formed in order that they might get the glory of discovering them. In addition to the evidence in the record of some witnesses who swore that they had been paid small sums of money, etc., several documents are here referred to.

"First, an interview with Captain Ebersold, published in the Chicago *Daily News*, May 10, 1889.

"Ebersold was chief of the police of Chicago at the time of the Haymarket trouble, and for a long time before and thereafter, so that he was in a position to know what was going on, and his utterances upon this point are therefore important. Among other things he says:

"It was my policy to quiet matters down as soon as possible after May 4. The general unsettled state of things was an injury to Chicago. On the other hand, Captain Schaack wanted to keep things stirring. He wanted bombs to be found here, there, all around, everywhere. I thought people would lie down and sleep better if they were not afraid that their homes would be blown to pieces any minute. But this man, Schaack, this little boy who must have glory or his heart would be broken, wanted none of that policy. Now, here is something the public does not know. After we got the anarchist societies broken up, Schaack wanted to send out men to again organize new societies right away. You see what this would do. He

Does the Proof show Guilt?

Was it Personal Revenge?

The Chief of Police's Statement.

wanted to keep the thing boiling, keep himself prominent before the public. Well, I sat down on that, I didn't believe in such work, and of course Schaack didn't like it.

"After I heard all that I began to think there was perhaps not so much to all this anarchist business as they claimed, and I believe I was right. Schaack thinks he knew all about those anarchists. Why, I knew more at that time than he knows to-day about them. I was following them closely. As soon as Schaack began to get some notoriety, however, he was spoiled."

"This is a most important statement, when a chief of police, who has been watching the anarchists closely, says that he was convinced that there was not so much in all this anarchist business as was claimed, and that police captain wanted to send out men to have other conspiracies formed in order to get the credit of discovering them and keeping the public excited, it throws a flood of light on the whole situation, and destroys the force of much of the testimony introduced at the trial.

"It is further charged with much bitterness by those who speak for the prisoners that the record of the case shows that the judge conducted the trial with malicious ferocity and forced eight men to be tried together; that in cross-examining the State's witnesses he confined counsel for the defense to the specific points touched on by the State, while in the cross-examination of the defendants' witnesses he permitted the State's attorney to go into all manner of subjects entirely foreign to the matters on which the witnesses were examined in chief; also that every ruling throughout the long trial on any contested point was in favor of the State; and, further, that page after page of the record contains insinuating remarks of the judge, made in the hearing of the jury, and with the evident intent of bringing the jury to his way of thinking; that these speeches, coming from the court, were much more damaging than any speeches from the State's attorney could possibly have been; that the State's attorney often took his cue from the judge's remarks; that the judge's magazine article recently published, altho written nearly six years after the trial, is yet full of venom; that, pretending to simply review the case, he had to drag into his article a letter written by an excited woman to a newspaper after the trial was over, and which therefore had nothing whatever to do with the case, and was put into the article simply to create a prejudice against the woman, as well as against the dead and the living, and that, not content with this, he in the same article makes an insinuating attack on one of the lawyers for the defense, not for anything done at the trial, but because more than a year after the trial, when some of the defendants had been hung, he ventured to express a few kind, if erroneous, sentiments over the graves of his dead clients, whom he at least believed to be innocent. It is urged that such ferocity or subserviency is without a parallel in all history; that even Jeffereys in England contented himself with hanging his victims, and did not stop to berate them after they were dead.

"These charges are of a personal character, and while they seem to be sustained by the record of the trial and the papers before me, and tend to show that the trial was not fair, I do not care to discuss this feature of the case any further, because it is not necessary. I am convinced that it is clearly my duty to act in this case for the reasons already given, and I, therefore, grant an absolute pardon to Samuel Fielden, Oscar Neebe, and Michael Schwab, on this 26th day of June, 1893.

**Prejudice or
Subserviency
of Judge.**

"JOHN P. ALTGELD,
"Governor of Illinois."

In *The Century Magazine* for April, 1893, Judge Gary gives, in a 30-page article, a defense of the verdict.

Judge Gary's statement in substance is this:

Mr. Gary reviews the events and scenes of the trial in detail, stating his motives to be a justification of the verdict and an effort to prove that the anarchists did not represent the laboring classes, but simply made a show of friendship to the latter in order to bring them into their own ranks. He asserts that the seven men sentenced to death were beyond all cavil guilty of murder, and that it would have been a great misfortune if society had not maintained its right to defend itself. The most noted legal authorities are adduced to show that the men who argued on every occasion

for anarchy and destruction, in their press and through their orators, and who "incited, advised, encouraged the throwing of the bomb that killed the policemen," were clearly within the condemnation of the law. To further support this, *facsimile* and other long extracts are given from the more rabid anarchistic press, and pictures appear of the bombs and apparatus of the desperate men.

Mr. Gary shows carefully and fairly the evidence which led to the conviction of the ringleaders, and takes the ground that they were sentenced not because they were anarchists, but because they were parties to murder.

On page 835 the judge says: "The conviction proceeded upon the ground that they had generally, by speech and print, advised large classes to commit murder; and had left the commission, the time, and place, and when to the individual will and whim or caprice, or whatever it may be, of each individual man who listened to their advice; and in consequence of that advice, in pursuance of that advice, and influenced by that advice, somebody, not known, did throw the bomb that caused Degan's death."

On pages 830 and 831 the judge says: "It is probably true that Rudolph Schnaubelt threw the bomb. He was twice arrested; but, having shaved off a full beard immediately after that fatal night, was discharged. After the second arrest he disappeared and has gone to parts unknown. But whether Schnaubelt or some other person threw the bomb is not an important question."

The case is the more remarkable because it was not claimed that either of the prisoners threw the bomb or gave any person any secret advice to throw it. The case proceeded on the ground that the prisoners gave all their advice from public platforms and in the columns of newspapers. On page 830 the judge says: "Secrecy is not essential to a conspiracy."

On page 824 the judge says: "They incited, advised, encouraged the throwing of the bomb that killed the policeman not by addressing the bomb-thrower specially, and telling him to throw a bomb at that or any special time or occasion, but by general addresses to readers and hearers."

On the same page he also says: "The sincerity of the anarchists in their belief of the benefits to accrue from anarchy (if they were sincere) is not to be considered when the question is whether they were murderers."

On page 812 the judge says that "every reader (of the anarchist papers), following the advice to arm himself, would—must—understand that he must exercise his own discretion in using his weapons."

He concludes: "For nearly seven years the clamor, uncontradicted, has gone round the world that the anarchists were heroes and martyrs, victims of prejudice and fear. Not a dozen persons alive were prepared by familiarity with the details of their crime and trial, and present knowledge of the materials from which those details could be shown, to present a succinct account of them to the public. It so happened that my position was such that from me that account would probably attract as much attention as it would from any other source. Right-minded, thoughtful people, who recognize the necessity to civilization of the existence and enforcement of laws for the protection of human life, and who yet may have had misgivings as to the fate of the anarchists, will, I trust, read what I have written, and dismiss those misgivings, convinced that in law and in morals the anarchists were rightly punished, not for opinions, but for horrible deeds."

The main sources of evidence for the facts are, of course, the official records of the court. A history of the trial has been written by Dyer D. Lum, and the speeches of the anarchists in court have been printed many times in pamphlet form. For the other side, see the *Century*, April, 1893. We append a brief notice of the condemned.

George Engel was born in the city of Cassel, Germany, April 15, 1856. His father died when George was only 18 months old, and when he was 12 years of age his mother died, and he was thrown on the world. After much suffering he was enabled to learn the painter's trade, after which he came to America. In January, 1873, he secured work in a Philadelphia concern, and in the summer of the same year obtained work at his trade. In Philadelphia, for the first time in his life, he heard something about serious labor troubles,

George
Engel.

through seeing some of the militia marching through the streets after subduing some striking miners. He removed to Chicago, where he began the study of social questions, and was an active worker in the International Working People's Association. Engel says: "The history of all times teaches us that the oppressing classes always maintain their tyrannies by force and violence. Some day the war will break out, therefore all working men should unite, and prepare for the last war, whose outcome will be the end forever of all war, and will bring peace and happiness to all mankind." At the time of the anarchistic excitement at Chicago Engel was arrested for his utterances and sentenced to 15 years in the State prison, but was pardoned by Governor Altgeld in 1893.

Samuel Fielden was born at Todmorden, Lancashire, England, February 25, 1847. His father was one of the Fielden Brothers, owners of the largest mills in that part of the country, and was interested in the reform movements of the day.

Samuel Fielden.

Samuel's mother died when he was 10 years old, and his father died August 28, 1866, nine years later. Samuel says of his home life: "I remember that the most intelligent people of our acquaintance, instead of going to church Sunday, used to meet at our house to discuss politics, religion, and all subjects pertaining to social and political life. These discussions contained a peculiar charm for me, and gave me my first taste for the study of sociology. When the ten-hour movement was being agitated in England my father was on the committee of agitation in my native town, and I have heard him tell of sitting on the platform with the Earl of Shaftesbury, John Fielden, Richard Oastler, and others." A great deal of Samuel's early life was spent in a factory, and while he says he could write volumes, he contents himself with saying: "I think if the devil has a particular enemy whom he wishes to unmercifully torture, the best thing for him to do would be to put his soul into the body of a Lancashire factory child, and keep him as a child in a factory the rest of his life."

Fielden is spoken of by all who know him as "good-natured Fielden." In his speech at the Haymarket Square meeting, even as reported by the *Chicago Tribune*, not one word can be found which has the least suggestion of bomb-throwing, or containing any proposition or suggestion for the use of violence that night or in the immediate future. His presence there and his speaking resulted simply from the request for speakers sent to the meeting of the American group. He was sentenced to 15 years' imprisonment at Joliet, Ill., in 1887, but was pardoned by Governor Altgeld in 1893.

Adolph Fischer, one of the Chicago anarchists, born in Bremen, Germany, came to America at the age of 15, and learned the printer's trade. He was married in 1881, and has three children living with his widow. He was executed by order of the court in 1887. While living at Chicago he was employed on the *Arbeiter Zeitung*, and was a zealous student of the labor question. In early life, before coming to America, he grappled with the social problem. He went among the working people and saw their condition, and says of them: "I perceived that the diligent, never-resting human working bees, who create all wealth, and fill the magazines with provisions, fuel, and clothing, enjoy only a minor part of this product, and lead a comparatively miserable life, while the drones, the idlers, keep the warehouses locked up, and revel in luxury and voluptuousness." Fischer was one of the speakers at Haymarket Square the night the bomb was thrown.

Louis Lingg was born in Mannheim, Germany, September 9, 1865. His father was a lumberman, and his mother did laundry work. Louis said: "When 13 years old, I received the first impressions of the prevailing unjust social institutions—i.e., the exploitation of man by man. The main circumstances which caused these reflections were the experiences of our own family. It did not escape my observation that the employer of my father grew continually richer, despite the extravagance of himself and family; while my father, who had performed his part in creating the wealth the boss possessed, and who had sacrificed his health, was cast aside like a worn-out tool. The feeling of hatred of existing society thus implanted in my mind was intensified with my entrance into the industrial arena."

Lingg learned the trade of a carpenter, and after serving, according to German custom, a three years' apprenticeship, he traveled in Southern Germany and

afterward in Switzerland, working wherever there was a chance. Soon he learned the doctrines of socialism, which he eagerly espoused. He came to America in 1885. Settling in Chicago, he worked at his trade, became an active member of the union of the craft, and was appointed an organizer of the Brotherhood of Carpenters and Joiners. Lingg pointed with pride to the fact that his union came out of the ill-fated eight-hour movement in May, 1886, with undiminished strength. Lingg was arrested and sentenced to death after the Haymarket affair, but while in jail under sentence he took his own life, by exploding a cartridge in his mouth.

Oscar Neebe was born in Philadelphia in 1850, of German parents. While not a wage-worker, but a well-to-do business man, he was always in sympathy with the toiling masses, was a staunch supporter of socialistic ideas, and did wonderful service as an organizer of trade-unions. He became associated with the anarchists of Chicago, and was arrested after the bomb-throwing at Haymarket Square, altho he had nothing to do with the meeting of the bomb-throwing. He was sentenced to 15 years in the State prison, but was pardoned by Governor Altgeld, in 1893, the governor declaring that his sentence, as well as that of his associates, was unjust, and not in accord with the evidence.

Oscar Neebe.

Albert R. Parsons, the so-called Chicago anarchist, was born in Montgomery, Ala., June 24, 1848. His father, Samuel Parsons, who was noted as a public-spirited, philanthropic man and an active temperance advocate, was a manufacturer of shoes. Albert's mother died when he was two years of age, his father three years later; and Albert came under the guardianship of his elder brother, General W. H. Parsons, who was married and living at Tyler, Tex. In 1855 the family moved to the Texas frontier, where Albert became an expert in the use of fire-arms, riding, and hunting.

Albert R. Parsons.

In 1859 he went to Waco, Tex., living one year with his sister (wife of Major Boyd). In 1860 he was apprenticed to learn the printer's trade in the Galveston *News* office. When the Civil War broke out, in 1861, tho but 13 years of age, he joined a local volunteer company. He wanted to enlist in the Confederate army, but his employer and guardian ridiculed the idea, on account of his age and size. Albert then took French leave, and enlisted in a local artillery company; his enlistment expired in a year. He then joined the cavalry brigade of his brother, General Parsons. Albert was afterward a member of the renowned McMabyscouts. He returned to Waco at the close of the war, and for a short time attended the university at that place; after this he finished learning the printer's trade.

In 1868 he published and edited the *Spectator*, a weekly paper. In it he advocated the acceptance in good faith of the terms of the surrender, and supported the thirteenth, fourteenth and fifteenth amendments, and the reconstruction measures.

He became an active Republican, and consequently incurred the enmity of many former army comrades, neighbors, and the Ku-Klux-Klan; and for his courageous advocacy of their cause he won the love of the enfranchised slaves, and the *Spectator* came to an end. In 1869 he was appointed traveling correspondent and agent for the Houston *Daily Telegraph*.

In 1870, at 21 years of age, he was appointed assistant assessor of United States Internal Revenue, under General Grant's administration. About a year later he was elected one of the secretaries of the Texas State Senate, and was soon after appointed chief deputy collector of United States Internal Revenue at Austin, Tex., which position he held satisfactorily, accounting for large sums of money. In 1873 he resigned his position, and accompanied an editorial excursion as the representative of the *Texas Agriculturist*, making an extended tour through Texas, Indian Territory, Missouri, Iowa, Illinois, Ohio, and Pennsylvania. In the fall of 1872 he married the Spanish Indian maiden whom he had met while traveling for the Houston *Telegraph*. At the close of his tour, in 1873, he decided to settle in Chicago.

He became interested in the labor question in 1874, and in 1876 joined the working men's party, and soon became one of its most trusted leaders. July 4, 1876, he joined the Knights of Labor. In 1877 he was the working men's candidate for county clerk, receiving about 8000 votes. He was nominated by the working men of Chicago three times for alderman, twice for county clerk and once for Congress. In 1879 he was delegate

to the national convention of the socialistic labor party, and was there nominated for President of the United States, but declined the honor, not being of the constitutional age (36 years). In 1876 he was chosen assistant editor of the English weekly, *The Socialist*. He kept up an active participation in the labor movement till 1880, when he withdrew from further active effort. The conviction gained on him that long hours and low wages practically disfranchised the masses of the people. Bribery, intimidation, duplicity, corruption, and bulldozing, he says, grew out of the condition which made the working people poor and the idle rich; on this account he subsequently turned his efforts toward reducing the hours of labor.

The National Conference of Labor Reformers held in Washington, D. C., 1880, adopted a resolution, forwarded by Parsons, which called attention to the fact that the United States Congress, when it neglected to enforce the eight-hour law, passed years before, and made applicable to Government departments, found it easy enough to pass and enforce all capitalistic legislation demanded. In 1884 the International founded in Chicago a weekly newspaper, called *The Alarm*, and Parsons was chosen editor. The paper was anarchistic in tone, and was suppressed by the State Government in May, 1886. It was during this month that the Haymarket affair took place; for participation in which Parsons was tried, and subsequently hanged at Chicago, altho, according to evidence, he had no hand in the throwing of the bomb that killed the police, except so far as his speeches may have incited the act.

Michel Schwab, born in Kitzingen, Central Germany, August 9, 1853, was left an orphan at 12 years of age, and when about 14 was apprenticed to a bookbinder.

Michel
Schwab.

This apprenticeship expired in 1872, and he became interested in the study of the great labor problem, and was an active member of trade-unions. He joined the socialistic labor party, and in 1874 traveled over Central Europe, agitating the cause, and working at his trade at all times for support. In 1879 he emigrated to the United States, and shortly after arrival went to Chicago, where he lived during the remainder of his life, except for a short time, when he traveled about working at his trade in Milwaukee, Kansas City, Denver, Leadville, Cheyenne, and Durango. He joined the socialistic labor party while in Milwaukee, and ever after was its active advocate. On his return to Chicago he became engaged as reporter, and afterward assistant editor, on the *Arbeiter Zeitung*. He was arrested for his utterances at the time of the Haymarket affair, and was executed in 1887. He was always ready to respond to any call in behalf of working men.

August Vincent Theodore Spies was born in Landerk, Germany, December 10, 1855; emigrated to America in 1871, and learned the upholstery trade in Chicago.

August
Spies.

In 1876 he began taking an active part in the labor movement, and in 1877 joined the socialists. In 1880 he became publisher of the *Arbeiter Zeitung*, and in 1884 was also business manager and editor. A man of force and energy, a ready writer and good speaker, and possessing a good moral character, he acquired great influence among those of socialistic and anarchistic tendencies, his writings and speeches attracting wide attention. He was hanged November 11, 1887.

CHILDREN'S AID SOCIETY (of New York City), THE, was organized in February, 1853, by the late Charles L. Brace (*q. v.*), who with a few other gentlemen had already been working for the vagrant boys of New York City. The society was incorporated in 1854 "for the education of the poor, by gathering children who attend no school into its industrial schools, caring and providing for children in lodging-houses, and procuring for them homes in the rural districts and in the West."

The fundamental idea upon which the society was founded, and which has been its governing motive ever since, was that of self-help—of teaching children how to help themselves. The industrial schools, now numbering 21, have trained and given aid and encouragement to over 100,000 children of the very poor. In the boys' and girls' lodging-houses about 200,000

homeless and vagrant boys and girls have found shelter, instruction and the kindly advice and admonition of experienced superintendents.

Up to 1892 the society had emigrated 84,318 children, of whom 51,427 were boys and 32,891 were girls. Some of these were not sent to a great distance, nearly 39,000 of them being placed in the State of New York, 4149 in New Jersey, etc. The Western States receiving the largest number were Illinois, to which 7366 were sent; Iowa, 4852; Missouri, 4835; Indiana, 3782; Kansas, 3310; Michigan, 2900; Minnesota, 2448. The children have been placed at an average expense of \$10 per child, and at first little care was taken in placing and supervising them; but recently much greater care has been necessary to reconcile the States to receiving them.

Hastings H. Hart, of the Minnesota State Board of Corrections and Charities, has investigated the results of the children placed in Minnesota by the Children's Aid Society of New York, and finds that the methods of placing were frequently too inexpensive and incautious; and while for the most part the society took care of children that did not turn out well, this was not true in all cases. In some cases they were placed in families so destitute as to be receiving public assistance, and other unsatisfactory placements were made. "From our experience," says Mr. Hart, "we are positive in the opinion that children above the age of 12 years ought not to be sent West by the Children's Aid Society. In this opinion I understand that the officers of the society concur. Our examination shows," concludes Mr. Hart, "with reference to children under 12 years of age, that nine tenths remain, four fifths are doing well, and all incorrigibles are cared for by the society. If properly placed, faithfully supervised, we are willing to take our full share of these younger children in Minnesota" (quoted in A. G. Warner's *American Charities*, p. 230).

Of this whole number, 84,318 were children—51,427 being boys and 32,891 girls; 39,406 were orphans; 17,383 had both parents living; 5892 a father only; 11,954 a mother only, and of 6680 the parental relations were unknown. As supplementary to its work the society maintains: The East Side Mission, whose work is to distribute flowers daily during the summer months among the sick and poor; free reading-rooms for young men; the Health Home at West Coney Island, comprising cottages and dormitories where mothers with sick children are given an outing; the Sick Children's Mission, at 287 East Broadway, with a staff of 14 physicians and 4 nurses, who visit the sick poor at their homes and supply free medical attendance, medicine, and food for sick children, of whom 1500 are treated yearly; a summer home at Bath Beach, L. I., where over 4000 tenement-house children are given a week's outing at the seaside each year; six lodging-houses, five for boys and one for girls, in which, during 1892, over 6000 boys and girls were fed and sheltered; 21 industrial schools with Kindergartens, and 11 night-schools, in which 12,000 children were taught and partly fed and clothed during 1892. One of the industrial schools is located in each of the lodging-houses for boys. Special features of the girls' lodging-house, now called the Elizabeth Home for Girls, are its dressmaking department, sewing-machine and typewriting schools, and laundry. The instruction in all branches is free. A late adjunct to the society is a 125-acre farm located at Kensico, Westchester County, New York, for the primary and brief education of the large street boys in agriculture, preparatory to their being provided with places in the country. All the different branches of the society's work are dependent upon the contributions of the public.

At the Health Home in 1894 over 7000 mothers and children were received and given the benefit of pure sea air, together with skilled medical care and nourishing food; 2000 of these were there a week, and in instances where a longer stay was advisable the time was prolonged until a permanent cure was effected. Parties of little ones were also taken there each week from the nurseries.

The report for November, 1894, says: "There were during the past year, in our six lodging-houses, 6349 different boys and girls; 235,393 meals and 187,866 lodgings were supplied. In the 21 day and 12 evening schools were 13,307 children, who were taught and partly fed and partly clothed, 759,038 meals being sup-

plied; 2266 were sent to homes and employment, and restored to friends in both the East and the West; 3074 were aided with food, medicine, etc., through the Sick Children's Mission; 5399 children enjoyed the benefits of the Summer Home at Bath, L. I. (averaging about 540 per week); 7404 mothers and sick infants were sent to the Health Home at Coney Island; 98 girls have been instructed in the use of the sewing-machine in the Girls' Temporary Home and the industrial schools; 16 were taught typewriting, and 80 boys were trained at the Farm School; \$2836.48 have been deposited in the Penny Savings Banks. Total number under charge of the society during the year, 38,811. . . .

"The total annual expense of our 21 industrial schools and 12 night schools, for salaries, rents, food, clothing, books, fuel, etc., was \$130,822.53; which sum, divided by 6204, the average number in daily attendance, would make \$21.08 the annual cost for each child.

"In our lodging-houses 6349 boys and girls were fed, sheltered, and taught, during the past year at a total expense of \$55,100.89. Deducting \$24,138.61, being the receipts of the lodging-houses, together with the cost of construction, the net running expense was \$30,962.28; dividing this by the average nightly lodgings, 516, we have the average cost to the public of each child for the year, \$60.

"The total number for whom homes and employment have been found by the society during last year was 2266; the total cost for railroad fares, clothing, food, salaries, etc., was \$26,921.79; the average cost to the public accordingly, for each person sent, was \$11.88. Yet any child placed in an asylum or poor-house costs nearly \$140 a year."

"The central office of the society is at the United Charities Building, 22d Street and 4th Avenue.

CHILD LABOR.—There is, scarcely one subject in the whole range of social reform more important than that of child labor. It is, too, a subject of pressing importance at present in the United States, as well as in other countries. According to the census of 1880, of persons engaged in industry in the United States (17,392,099), 1,118,356 were children 15 years of age or under (Compendium of Tenth Census, Part II., p. 1358). The final returns on this subject for the census of 1890 are not yet available, though a census bulletin of *manufactures* alone gives the total number of employees as 4,711,831, of which 121,493 were children. But this figure is undoubtedly far too small. Pennsylvania is credited with 22,417 children at work. Says Mr. McCamant, Chief of Pennsylvania's Bureau of Industrial Statistics:

"The [1880] census returns for Pennsylvania give the number of youths from 10 to 15 years of age in the three grand divisions of industry, other than manufactures, mechanical and mining [agricultural, professional, and personal service, trade and transportation], as 46,620. There can be little doubt that this number was too small at the time the census was taken, but assuming it to have been correct, and allowing for the natural increase of child labor, there would be in 1887 not less than 50,000 children thus employed, which, added to the 75,000 employed in manufacturing and mining, would swell the total number of children employed in various occupations to 125,000."

Mrs. Florence Kelly, Chief Inspector of Factories and Workshops in Illinois, writes in the *Arena* for 1894:

"The 1890 census bulletin reports upon 20,483 manufacturing establishments in this State, and gives the total number of children employed in them as 5426. In five months' work we found 6576 children in 2542 establishments, a reason for once more challenging census figures, altho in our work girls under 16, as well as boys, are counted children. The census returns, it will be remembered, place girls over 15 years among adults, but reckon boys under 16 as children.

"Massachusetts in the census bulletin is credited with 8877 children, but the factory inspectors of Massachusetts report 9471 children under 16 in the textile mills *alone*, in January of 1889, Commissioner White

expressing the belief that 'much of the larger portion of small children employed is outside of the textile factories'" (*Report of Chief of District Police, 1888, pp. 22, 46*).

It is thus doubtful if there has been any reduction of child labor in the United States since 1880, even in manufactures; but taking into consideration the great retail stores, which have notoriously increased in size since 1880, and employ many times their former number of children as cash-boys, bundle-girls, etc., the total number of children employed in gainful occupations in the United States must largely have increased.

Child labor under its worst aspect is to be found in the "sweating shops" of New York, Brooklyn, Chicago, and other large cities. These workshops are often small confined rooms in the tenement-houses, **Child Labor in the Slums.** which, according to the report of a New York factory inspector, reproduce in an intensified form all the horrors of dirt and overcrowding to be found in European cities. Formerly cigar-making was largely carried on in these tenement-houses, but the unhealthy character of the industry caused the Legislature to interfere, and it was prohibited by an act of 1884. Nevertheless the New York Report for 1888 speaks of the unorganized cigar-makers as working still in tenement-houses. The explanation of this seems to be that the strong opposition of the Manufacturers' Association to the act led to its being declared unconstitutional by the Court of Appeals in 1887. The manufacture of cheap clothing is carried on in badly ventilated and overcrowded rooms, and in defiance of the provisions of the Factory Acts. The Chief Inspector for New York, in his fifth annual report, says: "Summed up in a nutshell, the trouble with the 'sweater' workshops of New York is this: the hours of labor are too long, being sometimes as high as 90 a week; the ventilating and sanitary arrangements are nearly always vile to the last degree, and the work-rooms are excessively overcrowded."

The wages of child labor in the United States are low, but so vary with age and trade that averages are, after all, misleading rather than helpful. According to extra Census Bulletin 67, the average wage paid to the 121,194 children it reports in **Children's Wages.** manufactures (girls under 15 and boys under 16) was \$139 per year. In Maine it was \$100; California, \$158; Illinois, \$144; Pennsylvania, \$151; Rhode Island, \$158; New York, \$161; Massachusetts, \$181. It must be remembered that this is *per year*, without reference to the number of days of employment. Massachusetts does not necessarily, according to the above table, pay children nearly twice what they are paid in Maine. She may have given more days' work. By industries for the whole country, children's wages averaged \$112 per year in making men's clothing, which employed 2065 children (of those reported); only \$29 in canning fruit, etc., which employed 5579 children (tho probably only a small portion of the year); \$130 in manufacturing cotton goods (where the work is commonly steady); \$78 and \$130 in two kinds of tobacco-making, which together employed 7618 children.

According to the report of the Rhode Island Labor Bureau (1891), p. 181, the average weekly wages paid to children in specified industries were as follows :

INDUSTRIES.	Boys.	Girls.
Cotton.....	\$2.83	\$2.89
Iron and steel.....	3.33	3.36
Jewelry.....	3.17	3.38
Rubber.....	3.50	2.38
Silk.....	2.80	2.45
Woolen and Worsted.....	3.48	3.40
Miscellaneous.....	3.02	2.91
Total	\$2.89	\$3.08

But this, too, must not be taken as the average earnings of children in stores, or as news-boys on the streets, etc.

The following table, from the Report on Germany of the (English) Royal Commission on Labor (p. 43), indicates that the evil is greater in the United States than in other countries. It should be said, however, that as factories are being developed in Germany, the employment of children there is increasing ; yet this is the table :

COUNTRY.	Children under 15.	Proportion to Total Number of Persons engaged in Occupations.
Germany (June 5, 1882)....	524,158	2.76
Italy (December 31, 1881)....	1,072,397	7.08
England and Wales (April 4, 1881).....	531,663	4.76
The United States (June 1, 1880).....	1,118,356	6.43

I. EUROPE.

No one can question, however, in any country the seriousness of the problem, and we approach it country by country.

We commence with England, as no other country has had so long or so carefully recorded an experience with the evils of child labor, or with efforts and legislation for its cure. We abridge for this purpose an essay by William F. Willoughby, published by the American Economic Association.

England.

He says in substance :
 "The growth of child labor is inseparably connected with the introduction of machinery. In the year 1769 Mr. Arkwright obtained his first patent for a machine for spinning cotton yarn, and commenced manufacturing by machinery. This was the beginning of the factory system. Then followed Compton's spinning mule in 1775, Cartwright's power-loom in 1787, and in 1793 the invention of the famous cotton-gin by Eli Whitney. Thousands of hands were suddenly required to work at places far distant from home. The small and nimble fingers of little children were by far the most in request. Before the change had attracted much attention, large numbers of children were massed together in factories.

"The first form of child employment differed greatly from that of later years. The first system originated in the procuring of apprentices from the different parish workhouses of London, Birmingham, and elsewhere. Many thousands of these little hapless creatures, ranging from 14 down to four and even three years of age, were thus sent down into the North. Agreements of the most revolting character were often made between the manufacturers and the differ-

ent parish workhouses for bands of children for a number of years, in which the condition of the children was totally disregarded. Such, for example, were those provisions whereby it was agreed that with every 20 sound children one idiot should be taken.

"Says Professor Walker (*Political Economy*, p. 381):
 "The beginning of the present century found children of five and even three years of age in England working in factories and brick-yards; women working underground in mines, harnessed with mules to carts, drawing heavy loads; found the hours of labor whatever the avarice of individual mill-owners might exact, were it 13, 14, or 15; found no guards about machinery to protect life and limb; found the air of the factory fouler than language can describe, even could human ears bear to hear the story."

"According to the statement of Dr. Gould, out of 23,000 factory hands investigated by him, in 1816, 14,000 were under 18. In the same year a return from 41 mills in Scotland gave a total of 10,000 employees, of which 4404 were under 18, and of these 415 under 10. A similar return from Manchester gave a total of 12,940, of which 793 were under 10 and 5460 between 10 and 18 (Gaskell, *Report of 1816*).

"Children of all ages, down to three and four, were found in the hardest and most painful labor, while babes of six were commonly found in large numbers in many factories. Labor from 12 to 13 and often 16 hours a day was the rule. Children had not a moment free, save to snatch a hasty meal or sleep as best they could. From earliest youth they worked to a point of extreme exhaustion, without open-air exercise or any enjoyment whatever, but grew up, if they survived at all, weak, bloodless, miserable, and in many cases deformed, crippled, and victims of almost every disease. Drunkenness, debauchery, and filth could not but be the result. Their condition was but the veriest slavery, and the condition of the serf or negro stood out in bright contrast to theirs. The mortality was excessive, and the dread diseases rickets and scrofula passed by but few in their path. It was among this class that the horrors of hereditary disease had its chief hold, aided as it was by the repetition and accumulation of the same causes as first planted its seeds. The reports of all the many investigations showed that morality was almost unknown. It was not an uncommon thing, in the mines, for men to work perfectly naked in the presence of women who, in turn, were bare to their waists, and below covered only by a ragged pair of trousers. In the coal mines the condition of the children was even worse. According to the report of 1822, on child-labor, it was estimated that fully one third of those employed in the coal mines of England were children under 13, and of these much more than one half were under 12. The facts revealed in this elaborate report of over 2000 pages, devoted chiefly to child-labor in coal mines, would be scarcely credible if they were not supported by the best of authority, so fearful was the condition of the children found to be. Down in the depths of the earth they labored from 14 to 16 hours daily. The coal often lay in seams only 18 inches deep, and in these children crawled on their hands and feet, generally naked, and harnessed up by an iron chain and band around their waists, by which they either dragged or pushed heavily loaded cars of coal through these narrow ways. In nearly every case they were driven to work by the brutal miners, and beaten, and sometimes even killed. Law did not seem to reach to the depths of a coal-pit. Thus these young infants labored their young lives out as if condemned to torture for some crime. But it is useless to dwell longer on their condition. Volumes might be filled in portraying their sufferings. Treated as brutes, they lived with no regard to morals, religion, education, or health, in a condition that will probably never be duplicated.

"The injustice of such a system could not long pass without criticism, and action was demanded of Parliament to remedy or abate this social disease. To Sir Robert Peel, Sr., belongs the honor of first providing a measure for the relief of this evil. In 1802 he commenced the factory legislation by securing the passage of his apprentice bill. This bill, altho of the most limited scope, and applying only to cotton factories, was then considered as a measure, radical if not revolutionary. This legislation then met with the bitterest opposition from the manufacturers and the political economists. Financial ruin to English manufacturers was predicted as the result of such interference.

Terrible Conditions.

First Legislation.

"With the abolition of the apprenticeship system, the law became inoperative, and unrestricted hours of labor again became the rule, and the condition of the children became, if possible, even worse than before. Accordingly, in 1815, Robert Peel again came to the front, and in that year secured the appointment of a committee to 'inquire into the expediency of extending the apprenticeship act to children of every description.' The result of this examination was presented to Parliament in reports for the years 1816, 1817, and 1818. The result of this was the passage of the Act of 1819.

"The employment of children under 9 was forbidden, and the hours of labor for those between 9 and 16 were limited to 12 hours daily. In 1825 a partial holiday was made compulsory for the children. In 1831 night work was forbidden to all under 21, and 11 hours a day was made a limit for those under 18.

"In 1833 Lord Ashley (afterward Earl of Shaftesbury) became the champion of the laborers by the introduction of a new bill, extending yet further the provisions of former acts. This act was the most substantial step yet taken in this direction. Its principal provisions were: (1) The employment of children under 9 was forbidden. (2) The hours of labor for those between 9 and 13 were limited to 8 hours a day. (3) The hours of labor for those under 18 engaged in worsted, hemp, tow, and linen-spinning should not exceed 12 hours a day, and night work was forbidden them. The most significant feature of this act, however, was that relating to school attendance, and the appointment of inspectors to enforce the law.

"In 1835 the employment of children under 10 in the mines was forbidden. These regulations were, however, by various devices, persistently evaded.

"As the introduction and use of machinery became more general, and the subdivision of labor became more minute, the employment of children became more extensive. The Parliamentary report of 1833 estimated that out of 170,000 employees in the cotton mills in that year, 70,000 were children under 18. In 1839 there were employed in the factories of England a total of 410,500 persons of all ages, and of these 192,887, or nearly one half, were under 18 years of age.

"In 1842, through the efforts of Lord Ashley, a commission was appointed to investigate the condition of children employed in England, and in 1842 was presented their first report, already referred to. In consequence of this report, the Act of 1843 was passed, which was the most important measure that had up to that time been adopted. It applied to all laborers outside of agriculture. By it 'freedom of contract' on the part of women was finally abolished. Women over 18 years of age were put in the same category as young persons, and their toil limited to 11 hours a day. Children under 13 were not allowed to work more than six and a half hours a day, and, above all, attendance at school was required for the other half day as a condition of employment. By this act the restriction of child employment was reduced to a uniform basis. It is difficult to measure the advancement thus given to the oppressed children. From this time on every working child in England spent as much time in school as in the workshop.

"In 1847 Lord Ashley secured the passage of another act, carrying out his plan still more fully. This completed the reduction of the working time for children under 13 to 5 hours per day, and to 10 hours for all women and those minors between the ages of 13 and 18.

"During the following years until 1878 various acts were passed extending the provisions of former acts in one or another direction. Of these, the Factory Act of 1874 was the most important. By it the minimum age for the employment of children was raised to 10.

"In 1878 this long line of legislation was fittingly crowned by the act of that year. This act, entitled 'An Act to Consolidate and Amend the Law Relating to Factories and Workshops' amends and consolidates in one wide-embracing act all the ground covered by the 16 acts passed between 1802 and 1878, besides embracing, with some changes, the Provision of the Public Health Act of 1875, and the Elementary Education Act of 1876.

It was prepared with the greatest care and fullness, and furnishes an admirable code for factory regulation. Never before had the paternalism of government been so strongly declared, and never before had the right of the workmen to demand protection by the State against their employers been so distinctly asserted. The importance of this act, as setting

Present Legislation.

forth the present regulation of child labor in England, demands a closer survey. Its provisions are as follows:

"(1) The hours of employment for children shall be as follows: those under 10 shall not be employed at all, and those under 14 shall be employed only half time, either in the mornings or evenings, or on alternate days. (2) The hours of employment for young persons (14 to 18) shall be from 6 to 6 or 7 to 7, of which 2 hours shall be devoted to meals, and on Saturdays all work shall cease for them at 1.30. (3) Adequate sanitary provisions are provided. (4) Also ample provisions against accidents. (5) A suitable number of inspectors and assistants are created to insure the due execution of the law. (6) Medical certificates of fitness for employment must be furnished by all under 16. (7) Weekly certificates must be obtained from the proper authorities by the employers, showing the required amount of school attendance for every child in their employ.

"The direct benefits resulting to the lower classes from this act cannot be equaled by any other act upon the rolls of Parliament.

"It will be seen from this brief sketch, that the English factory system was one of slow growth and development. One restriction after another was placed upon the employer, until to-day the English laborer is more taken care of by the Government than in any other country, Prussia possibly excepted. It can be said of it, as of no other course of legislation, that its results have all been beneficial, not only to the employees, but to the employers as well, as is now generally admitted by them. Its results have more than justified the acts in every particular. In it can be traced the rise of many important principles in the science of the functions of government. This series of acts first established the right of the State to regulate industry. It was the most important advance and attack that has yet been made upon the *laissez faire* doctrine, that 'the less government the better,' so strongly insisted upon by the old economists. Although every political economist who wrote before 1850 was uncompromisingly opposed to this legislation, not one who has written since 1865 has ventured to deny the advisability of the Factory acts.

"It is also characteristic of this earlier period, that the employers were unanimous in their opposition to any abridgment of their rights to employ children, and in this were supported in Parliament by such men of the school mentioned as John Bright, proud of the name of friend of the people; Lord Cobden and his associates, and many of the most distinguished of English statesmen. Every improvement in the condition of English labor was only obtained against the combined opposition of these two classes. Too much praise cannot be given to those men, Lord Ashley, Robert Owen, Oastler, and others, who labored unceasingly to secure the passage of these acts. This change of front by the employers and economists is one of the most cheering signs of the time."

II. CONTINENTAL EUROPE.

Of child labor in Germany, the report on that country of the (English) Royal Commission on Labor says:

"The employment of child labor in Germany shows a considerable proportionate decrease as compared with the middle of the century, but at the same time a decided increase during the last few years. In 1853 the number of children employed in Prussian factories was 32,000; 8000 were between 9 and 12 years of age, and 24,000 between 12 and 14. In 1868 and 1890 no children under 12 were to be found in Prussian factories, and the numbers of those between 12 and 14 were only 625 and 666. The abuses attendant upon the employment of children in the middle of the century have been described by Professor Thun, who states that in the textile industries of Gladbach and Aix-la-Chapelle it was not unusual to find children employed at only five or six years of age, and that the profits to be drawn from child labor of this kind were an encouragement to early marriages. In 1875, when an inquiry was made by the Federal Council into the question of the labor of women and children, the number of children employed throughout the German empire was 88,000, 24 per cent. of whom were between 12 and 14, and 76 per cent. between 14 and 16. The proportion of child to adult labor was about 1 to 10. The weekly wages of child-

Germany.

dren between 12 and 14 varied from 1 mark to 9 marks ; those of children between 14 and 16, from 14 marks to 13 marks ; the average wage of the first class was 3 marks and that of the second 5 marks.

"Since 1882 the extent to which child labor is employed can be computed from the reports of the factory inspectors, which give the following results :

YEAR.	Children from 12 to 14.	Young Persons from 14 to 16.	Total.
1882	14,600	123,543	138,143
1883	18,935	143,805	162,740
1884	18,882	135,477	154,359
1886	21,935	134,589	156,524
1888	26,913	169,252	196,165
1890	27,485	214,252	241,737

"The great increase noticeable in 1890 is due in part to the inclusion of Alsace-Lorraine in that year ; but even disregarding the 107 children and 10,168 young persons employed in those provinces, the record for the nine years shows an increase of 80 per cent. in the employment of children, and 65.2 per cent. in that of young persons. The factory inspectors state that on the whole this increase is not disproportionate to that of adult labor ; but Dr. Stieda is of opinion that adult labor has scarcely advanced at so rapid a rate."

According to the Industrial Code of 1891, based on the recommendations of the Berlin Conference, called by the emperor, children under 13 years of age cannot be employed in factories, and even if over 13 years of age they can only be employed if freed from the necessity for school attendance. The hours for children under 14 years of age must not exceed six a day, with a pause of at least half an hour, and young persons between 14 and 16 must not work in

Code of 1891.

factories more than 10 hours a day, with one hour's interval in the middle of the day, and half an hour in the morning and afternoon. Young persons must not be employed on Sundays or holidays, nor during the hours fixed for religious instruction by the authorized priest or pastor. In the country children over 10 may be partially exempted from school attendance, and allowed to assist in open-air work, such as minding cattle ; but this partial exemption is in the hands of the school inspectors, and is not, as a rule, granted until the completion of the eleventh or twelfth year. No child may be employed until a labor card stamped by the authorities has been given to the employer stating the name, day and year of birth, and denomination to which the child belongs ; the name, calling, and residence of the father or guardian, and the extent to which the child is still obliged to attend school. A list of all the children employed must be kept in every factory, and hung up, together with a statement of their hours, in the rooms in which they work. In certain occupations of unusual danger or unhealthiness, as mining, glass works, etc., the restrictions are still greater. Inspectors are appointed to enforce the laws.

France, by the law of 1884, prohibited child labor under 12, and limited it to 12 hours, with specified intervals for rest and meals to those between 12 and 16. Night and Sunday work were prohibited to boys and to girls under 21. The government, however, had considerable power of exception and regulation. By the law of November 2, 1892, children under 16 can only work 10 hours a day, and from 16 to 18, 11 hours. Night work and work underground are prohibited to children and women. All child labor under 13 is prohibited.

France.

In Italy child labor is carried to a large extent, but an act of 1886 forbade the employment of children under nine in factories, mines, or quarries, and those under 10 underground. Night work is prohibited for children under 12.

Italy and Switzerland.

Such an act shows, however, how evil conditions must have been and still are, particularly in the sulphur mines of Sicily. Switzerland has better laws ; women, girls and boys under 14 cannot be employed at night, nor can any child work in factories under 14. Subject to these restrictions, child labor is said to be very common in Switzerland.

In crowded Belgium, the conditions are frightful. Large numbers of children are employed in textile industries, and even in such unhealthily trades as glass-blowing ; but the worst conditions prevail in the mines. In 1891, Belgium had 4439 women and girls of over 16 and 2742 girls under 16 employed in above-ground mines, and 23,008 women and girls above 16, with 683 girls under 16, employed in underground mines. By a law which came into force January 1, 1892, the employment of women and children under 21 years of age is prohibited.

Belgium.

In vol. iv. of the Reports on the Labor Question (Brussels, 1888, p. 15), we read in the testimony that a young girl of 17 testified to going down into the mine at 5 A.M. and coming up sometimes at 9 and sometimes at 11 P.M. She said she loaded 60 to 70 cars per day, and fetched her empty cars from 150 to 300 ft. The earnings of these women are reported at 36 to 40 cents per day. One woman said her husband earned \$2.60 per week, and her boy 16 cents per day.

Sweden, by a law of 1883, forbids employment of all under 12, and limits the work of children under 14 to six hours, and under 16 to 12 hours. Night work is forbidden to all under 18. Denmark, by a law of 1873, forbids the employment of children under 10. Holland in 1874 forbade the employment of children under 12 save in domestic service and agricultural labor. Russia in 1884 forbade night work to women and all persons under 17. Children from 10 to 12 may only be employed in specified industries, and from 12 to 15 all limited to eight hours per day.

Other Countries.

Austria forbids the employment of children in factories under 14. Night work is forbidden to women and all under 16.

III. THE UNITED STATES.

Concerning child labor in the United States, one of the best statements is Mrs. Florence Kelly's tract, *Our Toiling Children* (written under her former name, Mrs. Wischnewsky), from which we condense the following, supplementing it by later statements. Mrs. Kelly says :

"There was a time in the history of the country when every child was a child, granted as its birthright ample time in which to grow to manhood or womanhood, and required to work only by the exigencies of family life on the paternal farm. That was in the early days, before the capitalistic system of production had developed in the new country, while work was still done chiefly for its product's uses, and not exclusively for exchange and profit. To-day the working man's child is a drudge from its babyhood. The children of the clothing makers in New York City begin work at four years of age, their labor power being available, under the sweating system of tenement-house manufacture, for picking out basting threads.

"The conditions under which children work are fraught with danger to life and limb, to health, morals, and intelligence. It is necessary to take up each of the dangers in its order ; first, then, the danger to life from fire.

Danger to Life from Fire.

"In 1888 Inspector White, of Massachusetts, said : 'It would be very little use to put a fire-escape on a powder house, and hundreds of the buildings now occupied for tenement and lodging-houses would, under favorable circumstances, burn down so quickly as to render nearly useless any means of escape that can be provided. The late fire in a tenement-house (factory) in New York is a striking example of the terrible results of such methods of construction' (*Second Annual Convention of Factory Inspectors*, June, 1888, pp. 27, 30).

"Speaking of Ohio factories, Chief Inspector Dorn says : 'It is somewhat difficult to speak with calmness of men who, while liberally insuring their property against fire, so that in case of such a visitation—a danger always imminent—their pockets shall not suffer, will not spend a dollar for the security of the lives of those by whose labor they profit' (*Report Second Annual Convention Factory Inspectors of America*, June, 1888, p. 10).

"Inspector Schaubert, of New York, reports : 'I find some fire-escapes made of gas-pipe bent and driven into the wall, that would require a trapeze performer

to ascend them. For instance, in Rochester are two buildings seven stories high. In one there are usually 150 and in the other about 270 female operatives employed on the top floors. But one stairway in each connects the various stories. In the rear of these structures, I find these gas-pipe arrangements for fire-escapes. . . . Another alleged fire-escape is that in the rear of a certain printing house. About 60 females are here employed on the fifth floor. Only one narrow staircase runs from the top of the building to the street, and in the rear a straight ladder extends from the top to the second floor. This ladder would be almost valueless in case a panic should seize the workwomen' (*Second Annual Report Factory Inspectors of New York*, 1887, p. 111).

'Even in Massachusetts, according to Commissioner White, 'the statutes in this regard (*i. e.*, precaution against loss of life by fire) are less definite in their provisions, and there is less in them to guide the inspector, than in any other laws which we are called upon to enforce' (*Report Second Annual Convention Factory Inspectors of America*, June, 1888, p. 37).

'To aggravate the danger of fire, there is a very general practice of locking the work-room doors.

'Imagine,' says Inspector Dorn, of Ohio, 'a large building filled with work people—men, women, and children—all the doors closed, the custodian of the keys absent, all means of egress cut off. In what peril would those people be in case of fire!'

Children are employed in vast numbers in mills of many kinds in tending steam-driven machinery. They are therefore especially exposed to danger of explosion. Of boiler explosions, Factory Inspector Dorn, of Ohio, says: 'The number of lives annually lost by the explosion of steam boilers is so great that it seems almost incredible that the State has done nothing toward securing a proper inspection of so necessary and yet so dangerous an adjunct of our manufacturing industries.'

'The National Association of Stationary Engineers furnish the following information in their address: 'We believe that the frequent killing and maiming of people by the explosion of steam boilers is unnecessary; that it can and should be entirely prevented; we have the evidence that our membership, numbering several thousand operating engineers, does not furnish a single one chargeable with the rupture or explosion of a boiler while under steam pressure. We ask that the prime cause of boiler explosions be removed, by enacting laws preventing the ignorant, drunken, unskillful from taking charge; that the law shall only permit the skillful, sober, and competent to take charge of this terribly destructive explosive. During the past 12 months a record has been kept of boiler explosions, comprising only those published by the daily press and others, that came to the knowledge of our members and were reported to the secretary of the society. From these reports we can give the following aggregates: Number of boiler explosions, 496; number of deaths, 607; number of injured, many fatally, 1273. Thus with incomplete returns we have 1970 people killed, maimed, or crippled, all resulting from ignorance, intemperance, and avarice.'

'The records of death and mutilation inflicted by machinery are defective everywhere, and the effort to obtain adequate data is new, even in Massachusetts. The first attempt to publish an official record, however incomplete, for one full year, of all accidents to employees reported to the State factory inspectors, was made simultaneously in Massachusetts, New York, and

New Jersey, and is embraced in the inspectors' reports of those States for 1887. A similar attempt is embraced in the report of the factory inspectors of Ohio for 1888. This record is in no case even approximately full, because the law requiring employers to report is nowhere adequately enforced. Yet the official data, with their descriptions of the killed and wounded, rival the records of actual warfare, and sustain the metaphor of the battlefield of industry. Altho in these lists the ages of the slain are not always given, the 'accidents' to children are known to be so numerous that Professor Hadley, while Commissioner of Labor Statistics for Connecticut, expressed his official opinion that this subject required special legislation.

'Inspector Wade, of Massachusetts, prefacing his statement with the assurance that 'there has been a steady decrease both in the number and severity of accidents from unguarded machinery,' proceeds to report 638 accidents to 624 persons, including 23 fatal accidents, 62 injuries to hands, 53 to arms, 224 to fingers, 29 to thumbs, 38 to legs, 40 to feet, 29 to heads, besides a large number unspecified (*Annual Report District Police*, 1887, pp. 37-47).

'In his first report for 1887, p. 27, Inspector Connally, of New York, says:

'It is no uncommon thing to see children working minus a hand or fingers, and twice during our brief term of office we have been in the factories where boys were injured by having their hands bruised by the machinery. In one New York City factory five children have been injured in four months.'

'The machines used for stamping metal are extremely dangerous, and boys and girls are chiefly employed at them. One day, in the office of the factory, the inspector met a boy looking for work who had lost two fingers where previously employed. When asked why he did not return to work where he was injured, he said that the loss of his fingers made him useless to his former employer.

'The time taken to clean the machinery is not considered by a few employers as a part of the regular working time, and they require the operatives to clean it after shutting down. Probably one third of the accidents occurring are caused by cleaning the machinery while in motion.'

'So says Inspector Fell, of New Jersey, adding:

'It is too much the practice of the management of factories for the purpose of saving five minutes of time, rather than stop the machinery, to allow (if they do not command) boys as well as men to replace a belt which has slipped off a pulley, while the driving shaft giving the power to the pulley is running at full speed; or oftener, to shut down to half speed, which is a dangerous practice, and should receive the fullest condemnation.

'The number of accidents occurring daily through unprotected machinery is really frightful. It is estimated that from 50 to 60 persons are killed or injured daily through accidents occurring by operating buzz-saws. We frequently read of young girls having their scalps torn off, boys having their fingers and arms cut off, or injured; death by being carried around shafting and so on, and yet almost all these frightful occurrences might be prevented by the strong arm of the law.' (*Third Annual Report Inspectors Factories and Workshops, State of New Jersey*, 1885, p. 20.)

'The dangers to health and morals besetting the working child, though less sensationally conspicuous than the danger of death by fire and explosion, are neither less deadly nor less widespread. They are most hideously visible in the tenement-houses of such cities as New York, Chicago, Boston and San Francisco, but every manufacturing community has its own share of havoc wrought upon the health and purity of the children of the working class.

'New York State taking the lead in manufactures, both in the amount of capital invested and the number and importance of its establishments as well as population, New York, as the 'epitome of the nation,' naturally forms the greatest market for child labor, and presents the most perfect types of its employment.

'Commissioner C. F. Peck, in his report of the Bureau of Labor Statistics of New York for 1884, p. 145, says:

'The employment by parents of children of tender age in the tenement-house cigar factories of New York City furnishes one of the strongest arguments presented in favor of the enactment of stringent and effective laws against the evil of enforced employment of children at laborious, unhealthy, and immoral callings, in many cases to satisfy the greed of those who by nature are intrusted with all that pertains to their present or future welfare, and who should be compelled by law to provide for the health, the morals, and the educational training of their offspring.'

'The following is sworn testimony of cigar-workers, taken from the same report (pp. 171, 162):

'All the children in tenement-houses work. I have seen those of nine and 10 years old at work.'

'I have seen children employed in tenement-house cigar factories varying in age from six years, I should say, to 14; they have been kept from school and been obliged to work almost any length of time without any regulations as to time, and barely have time to go through with their meals. . . . They were often compelled to remain in rooms which were overcrowded with adults, where decency was a strange factor, morality unknown, and where, in the heated term of the year, the adults were almost nude.'

'Inspector Connally, in his factory report for 1887, p. 26, says:

'The workshops occupied by contracting manufacturers of clothing, or sweaters, as they are called, are foul in the extreme. Noxious gases emanate from all corners. The buildings are ill-smelling from cellar to garret. The water-closets are used alike by males

Health and Morals.

Unguarded Machinery.

and females, and usually stand in the room where the work is done. The people are huddled together too closely for comfort, even if all other conditions were excellent. And when this state of things is taken into consideration, with the painfully long hours of toil which the poverty-stricken victims of the contractors must endure, it seems wonderful that there exists a human being that could stand it for a month and live.

"Least any one should suppose that the industrial conditions of New York are peculiar, local, worse than those of other American communities, I quote testimony covering several States, and showing that the evils of the exploitation of labor are inherent in the system of production by exploitation, and appear wherever that system develops.

"In his report of the Bureau of Statistics of Labor of Massachusetts for 1881, Mr. Carroll D. Wright said (p. 466):

"In our cotton mills especially, the women and children largely exceed the men, being often from two thirds to five sixths of the whole, and the proportion is steadily increasing. And what are these women and children but the very weakest and most dependent of all the people?"

"An operative testifies:
"Young girls from 14 and upward learn more wickedness in one year than they would in five years out of a mill."

"The following is taken from the Bureau of Labor Statistics of Wisconsin for 1883, p. 264:

"Janesville Cotton Manufacturing Company. I went to these mills some time ago, and found several children whom I suspected of being under 12 years of age. The company promised to discharge them, and I have every reason to think that they have done so. But there are some 300 women and children who are working 11½ to 12 hours per day and night, the night being the time most of the children are employed. It is a hard place to work; young persons cannot stand the strain and long hours. Child labor is the main feature; there are many of them under 14 years of age, and all have to work 11½ hours. The thermometer (I am told by an employee) averages in the heated term about 108 degrees. There are plenty of openings for light and air, but if there is too much air stirring, the windows must be left closed on account of blowing the cotton. The dressing-room thermometer runs (I am told) as high as 140 degrees, and averages 110 to 120 degrees. (Men work here eight to 10 hours a day.) I am told by employees that girls who have worked here since last September are quitting on account of loss of health caused by hard work and long hours; they can-

not stand the intense heat at night, and they cannot get sufficient sleep in the daytime."

"Mr. Fassett, Commissioner of Bureau of Statistics of Labor for Ohio, says in his report for 1887, p. 9:

"I have found boys 12 and 14 years old struggling for a livelihood in a room heated 20 degrees Fahrenheit."

"Working children know nothing of the education of happy home life. Many of them are orphans, for the average life of the working man is short at best, and the 'accidents' involved in scores of occupations rob a very large number of children of paternal care and support. Then the widowed mother is obliged to turn home into a laundry or go out to work. Home life is lost.

Education.

"So much for the home training of our working children. Now as to the schools. Scores of thousands of American-born children under 16 years of age are earning their bread to-day who have never entered a school-room. I am not speaking of the negro illiteracy of the South, but of the great manufacturing States of the North. For thousands of these children there are no schools provided. New York and Philadelphia have not even an accurate census of the school population upon which to base calculation of the school accommodations necessary. Superintendent McAllister, of Philadelphia, believes that 10,000 children of that wealthiest of cities are out of school because there are no schools provided for them. And he has shown in his report for 1888 that 4716 children attending school are unprovided with desks. A like story comes from Chicago, and from every large manufacturing community outside of Massachusetts.

"The New Jersey Compulsory School Law especially exempts from its provisions those cities which have not provided sufficient school accommodations, thus putting a premium for manufacturing communities where child labor is a tempting commodity, upon failure to provide adequate schools.

"Mr. A. S. Draper, State Superintendent of Public Education for New York, says in his report of 1888:

"There is a large uneducated class in the State, and our statistics show that it is growing larger. The attendance upon the schools does not keep pace with the advance in population."

Thus far Mrs. Kelly, writing in 1887. *The Seventh Special Report of the United States Commissioner of Labor* (Carroll D. Wright), 1894, upon slums (p. 76), gives the following table of the proportion of children in the slums at work and at school (based on a canvas of 83,852 people):

Slums.

(See SLUMS.)

IV. ECONOMIC BEARING.

It is sometimes said that child labor is necessary to eke out the parents' wages; but the real result is to lower the parents' wages.

Professor Richard T. Ely, in his *Introduction to Political Economy*, says (p. 221):

"Among the striking evidences of the truth of the standard of life, as the norm for wages, the fact is especially noteworthy that, as a rule, it seems to fail to benefit the laboring population on the whole, and for any length of time, for the wife and children to earn money, even apart from all other considerations than mere money-getting. The world over, when it becomes customary for the wife, or wife and children, to work in factories, it very soon becomes necessary for them to do so to support the family. The wages of the head of the family and the earnings of the entire family, as before, just maintain the standard of comfort among that class of the population. Professor E. W. Bemis has called attention to the fact that in the textile industries of Rhode Island and Connecticut, where the women and children work, the earnings of the entire family are no larger than in other industries, like those in metal, in western Connecticut, where only the men work."

The Inspector of Factories for New Jersey, in his second annual report (1884, p. 19), says: "The employment of children has increased with the reduction of wages, and the employment of adults has decreased with the employment of children."

The Hon. Carroll D. Wright, in the sixth annual report of the Bureau of Labor of Massachusetts, says (p. 51):

"There seems, within recent times, to have occurred a change in the relation of wages to support, so that, more and more, the labor of the whole family becomes necessary to the support of the family; that, in the majority of cases, working men in the commonwealth do not support their families by their individual earnings alone. The fathers rely, or are forced to depend, upon their children for from one quarter to one third of the entire family earnings, and the children under 15 years of age supply by their labor from one eighth to one sixth of the total family earnings."

Socialists argue that child labor is the result of competition. Says the *American Fabian* (April, 1895):

"Child labor is the result of competition. Under competition the employer *must* employ the cheapest labor that will produce the required quantity and quality of work. Machinery enables small girls to do the work formerly done by skilled men. In making paper four men and six girls can now do work formerly done by 100 men, and do it better. In the jewelry trade one boy and a machine, in a day, can turn out 9000 pairs of gold sleeve-buttons" (D. A. Wells, *Recent Economic Changes*, p. 53).

V. LEGISLATION.

The following summary of legislation on child labor in the United States is taken from the report on the United States of the (English) Royal Commission on Labor (1892), being the latest compilation available. Yet it must be remembered that this legislation is constantly changing, tho this progress has been temporarily checked by the fact that an Illinois act to limit the work of women factory employees to eight hours a day was decided (March 15, 1895) to be unconstitutional by the Illinois Supreme Court. (See JUDICIARY.) Says the English report (p. 31):

"In Connecticut, Massachusetts, Pennsylvania, and Wisconsin, no child under 13 may be employed; in New York the minimum age is 14; in Maine and Ohio it is 12, and in New Jersey it is 12 for boys and 14 for girls. Iowa, Kansas, Missouri, and Tennessee allow

no child under 12 to be employed in a mine, while in Indiana 12 is the limit in some industries, and 14 in a mine. The same limit is fixed in Colorado and Illinois for children in mines. The age below which children may not be employed at all is fixed at 10 in New Hampshire, Rhode Island, and Vermont. In New Hampshire a child of 12 may not be employed unless it has attended school the whole of the last school year. A child of 14 must have attended school for 6 months, and one of 16 for 3 months during the year preceding its employment, and all such children must be able to read and write. In Connecticut, Illinois, Massachusetts, Michigan, Missouri, Ohio, Rhode Island and Vermont children of 14 must not be employed unless they have attended school for a period in the preceding year varying from 12 to 20 weeks in the different States. In Colorado, Kansas, Maine, and New Jersey there is a similar provision in the first two States as regards children of 16, and in the last two as regards those of 15. The hours of labor for children are restricted to 10 in Indiana, Maine, Maryland, Massachusetts, Minnesota, New Jersey, New York, California, Louisiana, Michigan, New Hampshire, North and South Dakota, Virginia, Rhode Island, Pennsylvania, Ohio, and Vermont, and to 8 in Connecticut, Alabama, and Wisconsin. In Massachusetts they may not exceed 8 a week. Very many of the regulations concerning child labor are, however, ineffective, owing to a lack of sufficient and competent inspectors. Where the acts are enforced, as in Massachusetts, the result is encouraging. Between 1882 and 1890 the number of children under 14 years of age employed in Massachusetts decreased fully 70 per cent., and a considerable reduction was reported from Maine when the act had been in force only one year."

Says Mrs. Kelly, in the tract above mentioned:

"The legislation needed is of the simplest but most comprehensive description. We need to have: 1. The minimum age for work fixed at 16. 2. School attendance made compulsory to the same age. 3. Factory inspectors and truant officers, both men and women, equipped with adequate salaries and traveling expenses, charged with the duty of removing children from mill and workshop, mine and store, and placing them at school. 4. Ample provision for school accommodations. Money supplied by the State through the school authorities for the support of such orphans, half orphans and children of the unemployed as are now kept out of school by destitution.

What is Needed.

"Any provision less than this will share the defects of our present deplorable measures, whose very meagerness makes enforcement impossible. It is impossible to ascertain which children have gone to school 10, 12, 14, 16, or 20 weeks, as different States provide. But when all children are compelled to go to school all the school year, there will be no difficulty in verifying from the school records the statements of parents, children and teachers, with reference to the age and past attendance of a child applying for work, and claiming to be beyond the compulsory school age.

"So far as I have been able to ascertain, neither the women of the nation nor our philanthropic bodies have thus far taken steps toward the emancipation of our toiling child slaves, except the women's organization of Chicago in co-operation with the Woman's Alliance of Illinois, and Mrs. Leonora Barry, of the Knights of Labor. With these exceptions, all the noble struggle of half a century for the rescue of our toiling children seems to have been confined to the labor unions and to the bureaus of statistics of labor, which have themselves been created

year by year by the efforts of the working men since 1869."

References: Among the best are: *Two Prize Essays on Child Labor*, by William F. Willoughby, A.B., and Miss Clare de Graffenreid (American Economic Association, Baltimore); *Our Toiling Children*, a tract by Mrs. Florence Kelly (Wischnewetzky) (Woman's Temperance Publication Association, Chicago). The best reports on child labor are found in the Labor Reports of Connecticut (1885), Massachusetts (1874 and 1891), Michigan (1887); Minnesota (1889-90), New York (1890), Rhode Island (1891). See also reports on the various countries of the (English) Royal Commission on Labor. Among the best articles on child labor are: *Little Laborers of New York City*, by C. L. Brace (*Harper's*, 47: 321); *Children in Coal Mines of England* (*Eclectic*, 76: 201; *Quarterly Review*, 70: 158; *Westminster Review*, 38: 86); *Children in Factories* (*Quarterly Review*, 67: 171); *Children's Labor: a Problem*, by E. E. Brown (*Atlantic Monthly*, 46: 787); *Commission on Employments of Children* (*Quarterly Review*, 119: 364); *Child Labor: a Symposium* (*Arena*, 1894, vol. 10, p. 117).

CHILD, LYDIA MARIA (née FRANCIS), was born in Medford, Mass., February 11, 1802. Miss Francis attended the common schools and studied with her brother, Rev. Convers Francis, D.D. When 17 years old she saw an article in the *North American Review* discussing the field offered to the novelist by early New England history, and she immediately wrote the first chapter of a novel entitled *Hobomok*, and finished it in six weeks, and published it (Cambridge, 1821). From this time until her death she wrote continually. She taught in Medford and Watertown, Mass., till she married, in 1828. She began in 1826 the publication of the *Juvenile Miscellany*, the first monthly periodical for children issued in the United States.

In 1831 both Mr. and Mrs. Child became deeply interested in the subject of slavery. Mrs. Child's *Appeal for that Class of Americans called African* (Boston, 1833) was the first anti-slavery work published in America in book form, and was followed by several smaller works on the same subject. Mrs. Child had to endure social ostracism, but from this time was a steady champion of anti-slavery. On the establishment by the American Anti-slavery Society of the *National Anti-Slavery Standard*, in New York City, in 1840, she became its editor and conducted it till 1843, when her husband took the place of editor-in-chief, and she acted as his assistant till May, 1844. In 1859 she wrote a letter of sympathy to John Brown, then a prisoner at Harper's Ferry, offering her services as a nurse, and enclosing the letter in one to Governor Wise. Brown replied, declining her offer, but asking her to aid his family, which she did. She also received a letter of courteous rebuke from Governor Wise, and a singular epistle from the wife of Senator Mason, author of the Fugitive Slave Law, threatening her with future damnation. She replied to both in her best vein, and the whole series of letters was published in pamphlet form (Boston, 1860), and had a circulation of 300,000. She also wrote two small tracts on the *Fugitive Slave Law* and *Emancipation in the British West Indies*. During her latter years she contributed freely to aid the national soldiers in the Civil War, and afterward to help the freedmen. She died in Wayland, Mass., October 20, 1880:

Mrs. Child's works are voluminous and treat of a great variety of subjects. Besides those already men-

tioned are the following: *The Rebels; or, Boston before the Revolution*; *The American Frugal Housewife* (1829); *The Family Nurse*, or companion of *The Frugal Housewife*; *The Mother's Book* and *The Girl's Own Book* (1831); *History of Woman* (1835); *Biographies of Good Wives* (1833); *The Oasis* (1834); *The Anti-slavery Catechism* (1836); *Authentic Narratives of American Slavery* (1838); *The Evils of Slavery and the Cure of Slavery* (1836); *Philothea: A Grecian Romance* (1845); *Letters from New York* (2 vols., 1843-44); *Fact and Fiction* (1846); *Flowers for Children* (1852); *Isaac T. Hopper: a True Life* (1853); *The Progress of Religious Ideas through Successive Ages* (3 vols., 1855); *Autumnal Leaves: Sketches in Prose and Rhyme* (1857); *Looking toward Sunset* (1864); *The Freedman's Book* (1865); and *The Romance of the Republic* (1867).

CHINESE IMMIGRATION.—The general subject of immigration into the United States is considered under the article IMMIGRATION, but there is, or has been, one class of immigration into the United States which should be considered separately. The inhabitants of China up to 40 years ago were so averse to leave their native land that Chinese immigration scarcely existed. The total number of natives of China reported as having arrived in the United States before 1851 was 46. In 1854 the number of arrivals of this race increased to over 13,000. The immigration of the Chinese has since been:

The increasing number of Chinese laborers early excited fear and aroused opposition on the Pacific coast.

Some of the objections to the Chinese as permanent residents of this country were stated by Justice Field of the United States Supreme Court in a judicial opinion delivered in California in September, 1882. He said: "It was discovered that the physical characteristics and habits of the Chinese prevented their assimilation with our people. Conflicts between them and our people, disturbing to the peace of the country, followed as a matter of course, and were of frequent occurrence. Chinese laborers, including in that designation not merely those engaged in manual labor, but those skilled in some art or trade, in a special manner interfered with the industries and business of this State. Their frugal habits, the absence of families, their abil-

ity to live in narrow quarters without apparent injury to health, their contentment with small gains and the simplest fare gave them great advantages in the struggle with our laborers and mechanics, who always and properly seek something more from their labors than sufficient for a bare

Cheap Labor. livelihood, and must have and should have something for the comforts of a home and the education of their children. A restriction upon the immigration of such laborers was therefore felt throughout this State to be necessary if we would prevent the degradation of labor and preserve all the benefits of our civilization."

Other objections to the presence of the Chinese on the Pacific coast were allegations of unhealthful, vicious, and corrupting practices. Public feeling was aroused, and many attacks on them occurred in San Francisco and other cities. Restrictive measures were adopted by the city authorities designed to prevent the Chinese from carrying on their usual avocations. Some of these measures were oppressive enough to be rebuked by the local courts. A wide difference of opinion existed in various parts of the country as to the justness of some of the complaints and the necessity of forbidding the further importation of Chinese laborers.

A committee of the United States Senate and House of Representatives investigated the subject in 1876 and 1877, and made a report recommending legislation to restrain the incoming of Asiatic populations. The Chinese Government had never greatly favored the emigration of its subjects, and little difficulty in modifying the treaty with China was experienced in 1880, when, in response to the urgent appeals from the inhabitants of the Pacific coast, an effort was made to limit the immigration of Chinese laborers. The Burlingame treaty of 1868 had provided for free emigration and immigration, but the modified treaty permitted the limitation or suspension by the United States Government of the coming or residence in the United States of Chinese laborers, but the absolute prohibition of such immigration was forbidden.

After excited discussion Congress passed in 1882 a bill suspending for 20 years the coming into the United States of Chinese laborers. The bill was vetoed by President Arthur, but a modified act fixing the limit of suspension at 10 years became a law. The Chinese who had already become residents of the country were not disturbed, and those who wished to make visits to China with the intention of returning hither were furnished with passports. The suspension of immigration related only to laborers, a term which has been construed to include skilled workmen.

Nevertheless, this law was not considered sufficient by the Pacific coast, and in 1892 Congress was induced to pass a law not only forbidding Chinese immigration, but to exclude those now here except under certain conditions.

The following is the full text of "an act to prohibit the coming of Chinese persons into the United States," passed by the fifty-second Congress, approved by President Harrison May 5, 1892, and commonly called the "Geary Law":

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That all laws now in force prohibiting and regulating the coming into this country of Chinese persons and persons of Chinese descent are hereby continued in force for a period of 10 years from the passage of this act.

"Sec. 2. That any Chinese person or person of Chinese descent, when convicted and adjudged under any of said laws to be not lawfully entitled to be or remain in the United States, shall be removed from the United States to China, unless he or they shall make it appear to the justice, judge, or commissioner before

whom he or they are tried that he or they are subjects or citizens of some other country, in which case he or they shall be removed from the United States to such country: *Provided*, that in any case where such other country of which such Chinese person shall claim to be a citizen or subject shall demand any tax as a condition of the removal of such person to that country, he or she shall be removed to China.

"Sec. 3. That any Chinese person or person of Chinese descent arrested under the provisions of this act or the acts hereby extended shall be adjudged to be unlawfully within the United States, unless such person shall establish, by affirmative proof, to the satisfaction of such justice, judge, or commissioner, his lawful right to remain in the United States.

"Sec. 4. That any such Chinese person or person of Chinese descent convicted and adjudged to be not lawfully entitled to be or remain in the United States shall be imprisoned at hard labor for a period of not exceeding one year and thereafter removed from the United States, as hereinbefore provided.

"Sec. 5. That after the passage of this act on an application to any judge or court of the United States in the first instance for a writ of habeas corpus, by a Chinese person seeking to land in the United States, to whom that privilege has been denied, no bail shall be allowed, and such application shall be heard and determined promptly without unnecessary delay.

"Sec. 6. And it shall be the duty of all Chinese laborers within the limits of the United States, at the time of the passage of this act, and who are entitled to remain in the United States, to apply to the collector of internal revenue of their respective districts, within one year after the passage of this act, for a certificate of residence, and any Chinese laborer, within the limits of the United States, who shall neglect, fail, or refuse to comply with the provisions of this act, or who, after one year from the passage hereof, shall be found within the jurisdiction of the United States, without such certificate of residence, shall be deemed and adjudged to be unlawfully within the United States, and may be arrested by any United States customs official, collector of internal revenue, or his deputies, United States marshal, or his deputies, and taken before a United States judge, whose duty it shall be to order that he be deported from the United States as hereinbefore provided, unless he shall establish clearly to the satisfaction of said judge, that by reason of accident, sickness, or other unavoidable cause he has been unable to procure his certificate, and to the satisfaction of the court, and by at least one credible white witness, that he was a resident of the United States at the time of the passage of this act; and if, upon the hearing, it shall appear that he is so entitled to a certificate it shall be granted upon his paying the cost. Should it appear that said Chinaman had procured a certificate which has been lost or destroyed, he shall be detained and judgment suspended a reasonable time to enable him to procure a duplicate from the officer granting it, and in such cases the cost of said arrest and trial shall be in the discretion of the court. And any Chinese person other than a Chinese laborer, having a right to be and remain in the United States, desiring such certificate as evidence of such right, may apply for and receive the same without charge.

"Sec. 7. That immediately after the passage of this act the Secretary of the Treasury shall make such rules and regulations as may be necessary for the efficient execution of this act, and shall prescribe the necessary forms and furnish the necessary blanks to enable collectors of internal revenue to issue the certificates required hereby, and make such provisions that certificates may be procured in localities convenient to the applicants. Such certificates shall be issued without charge to the applicant, and shall contain the name, age, local residence, and occupation of the applicant, and such other description of the applicant as shall be prescribed by the Secretary of the Treasury, and a duplicate thereof shall be filed in the office of the collector of internal revenue for the district within which such Chinaman makes application.

"Sec. 8. That any person who shall knowingly and falsely alter or substitute any name for the name written in such certificate, or forge such certificate, or knowingly utter any forged or fraudulent certificate, or falsely personate any person named in such certificate, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined in a sum not exceeding \$1000 or imprisoned in the penitentiary for a term of not more than five years.

"Sec. 9. The Secretary of the Treasury may authorize the payment of such compensation, in the nature of

**The Geary
Law.**

fees to the collectors of internal revenue, for services performed under the provisions of this act, in addition to salaries now allowed by law, as he shall deem necessary, not exceeding the sum of \$1 for each certificate issued.

"In the special session of the Fifty-third Congress the following bill to amend the Chinese Exclusion act was introduced in the House of Representatives by Representative Everett, of Massachusetts. It was understood that this bill represented the policy of the Cleveland administration :

"Be it enacted, etc., that Section 6 of an act entitled 'An Act to Prohibit the Coming of Chinese Persons into the United States,' approved May 5, 1892, is hereby amended so as to read as follows :

"Sec. 6. And it shall be the duty of all Chinese laborers within the limits of the United States at the time of the passage of this act, and who are entitled to remain in the United States, to apply to the collector of internal revenue of their respective districts, on or before the first day of September, 1894, for a certificate of residence, and any Chinese laborer within the limits of the United States who shall neglect, fail, or refuse to comply with the provision of this act, or who, after said first day of September, 1894, shall be found within the jurisdiction of the United States without such certificate of residence, shall be deemed and adjudged to be unlawfully within the United States, and may be arrested by any United States customs official, collector of internal revenue, or his deputies, United States marshal, or his deputies, and taken before a United States judge, whose duty it shall be to order that he be deported from the United States, as hereinbefore provided, unless he shall establish clearly to the satisfaction of said judge that by reason of accident, sickness, or other unavoidable cause he has been unable to procure his certificate, and to the satisfaction of the court, and by at least one credible white witness, that he was a resident of the United States at the time of the passage of this act ; and if upon the hearing it shall appear that he is so entitled to a certificate, it shall be granted upon his paying the cost.

"Should it appear that said Chinaman had procured a certificate which has been lost or destroyed, he shall be detained and judgment suspended a reasonable time to enable him to procure a duplicate from the officer granting it, and in such cases the cost of said arrest and trial shall be in the discretion of the court. And any Chinese person other than a Chinese laborer having a right to be and remain in the United States desiring such certificate as evidence of such right, may apply for and receive the same without charge.

"Sec. 2. That no proceedings for a violation of the provisions of said Section 6 of said act of May 5, 1892, as originally enacted, shall hereafter be instituted, and all the proceedings for said violation now pending are hereby discontinued."

The law has been fiercely criticised as unfair in singling out one nation for such legislation, and in breaking treaty faith with China. Its defenders say :

"Objection is made to the registration, that it subjects the Chinese to hardships, and degrades them. If registry is degradation, there are many Americans who have a right to complain. Thirty-four States require that citizens shall register before being allowed to vote ; and in most of the States members of certain professions and trades are required to register and obtain a certificate before being allowed to pursue their calling.

"The law provides that officers go to the Chinaman wherever he be and afford him every facility for complying with the law, without expense or burden. The law was wise and just, and ought to be enforced. It is known from experience in California, where nine tenths of the Chinese in the United States reside, that the great mass of Chinamen here would willingly have complied with the law but for the threats of their masters, the Six Companies, who hold most of the Chinese in this country under control. The antagonism of the Six Companies to the law is not on account of the degradation it offers to their subjects, but because its enforcement would insure the prevention of any further importation of their slaves. It was the destruction of their slave-trade that caused the Six Companies to fight the law, and not any love for the vassals now in their employment here.

"The law is in entire accord with the last compact between this Government and China. In this treaty it is provided that :

"If Chinese laborers, or Chinese of any other class,

now either permanently or temporarily residing in the United States, meet with ill-treatment at the hands of any other persons, the Government of the United States will exert all its power to devise measures for their protection, and to secure to them the same rights, privileges, immunities, and exemption as may be enjoyed by the citizens or subjects of the most favored nation, and to which they are entitled by treaty.

"Such language is not found in any treaty with any other nation, and illustrates the acuteness of Chinese diplomacy. As the National Government is made primarily liable for any injury to Chinamen in the United States, it became the duty of this Government to adopt a system of registration of all these people for whose protection they became specially liable. The exercise of the registration power is justified by this treaty, and failure to require registration would be gross carelessness.

"The first duty of governments is to their own citizens. Is it fair to subject our laborer to the competition of a rival who measures his wants by an expenditure of six cents a day, and who is habituated to live on an income of five dollars per month? What will become of the boasted civilization of our country if our toiler is compelled to compete with this class of labor, with more competitors available from China than twice the entire population of Great Britain, France, Germany, Austria, Belgium, Denmark, Switzerland, Italy, the Netherlands, Portugal, and Spain?

"The Chinese laborer brings here no wife and no children, and his wants are limited to his individual necessities, while the American must earn income sufficient to maintain wife and babies."

The number of Chinese in the United States by the census of 1890 was 94,987, of whom 86,360 were in the Western States and 5404 in the North Atlantic States. (See IMMIGRATION.)

CHRIST AND SOCIAL REFORM.—The relation of Christianity to social reform and of the Church to social reform we consider under their respective heads. We here ask what was and what is the personal relation of Jesus Christ to the problems of social existence. With His relation to the individual and with any theological conceptions of Christ we are, in this cyclopaedia, not concerned, save as these conceptions bear directly upon social reform. But to a growing number of minds this is a very large and a very important question, and it must therefore be distinctly considered here, setting forth impartially, however briefly, all the important views.

1. We may very speedily state the opinion of those to whom Christ was but as any man, though perhaps the noblest, the best, the most inspired, nay, even in this sense, the most divine of men. To such a view Christ bears no special relation to social reform save as does any great leader and inspirer of human thought and action. Christ is conceived by those who hold this view in two main ways : (a) as a great idealist and religious teacher, quickening the world by lofty maxims, altruistic ideals, spiritual insight, above all, by a pure, self-sacrificing life. He is, as Sakyamouni, as Confucius, as Socrates, as St. Francis of Assisi, as many another, though perhaps greater than any other. His relation to social reform, according to this conception, is, therefore, to raise ideals of brotherhood, of self-sacrifice, of the supremacy of character over circumstances, of the scorn of material comfort. Mr. W. M. Salter says in his *Ethical Religion*, pp. 188, 189 :

"It cannot be claimed that we stand in any such relation to Socrates or the Hindu prince or Confucius as

**Argument
for the Geary
Law.**

**A Religious
Reformer.**

to Jesus. Socrates has not been without influence upon us, but it cannot be soberly called a tithe of that which Jesus has had. Would that men read the *Apology* oftener; they would find meat and drink in it, a tonic and an inspiration for their lives! But there is need for no such wish in relation to the Gospels. Jesus is an ideal of goodness, all too indistinct often, but hovering in the thought of wellnigh every one of us. It is true that there is much uncertainty relating not only to His life, but to His teaching; yet as there need be no doubt as to the main tenor and events of His life, so there need be none as to the commanding features of His teaching. They make too largely consistent a whole, and bespeak a mind of too much freshness and originality and power, to allow us to think of them as coming in an indefinite way from an age otherwise so traditional, so barren, and so prosaic."

The ethical features which Mr. Salter finds in Christ are: (1) His opposition to the traditional morality of His day; (2) His giving to the moral law a more distinct inward application, teaching that thoughts and words have a moral significance, like that of actions; (3) His removing of all barriers of love to our fellow-men; (4) His teaching that the "kingdom of God" is to come from above, and not in the natural course of things—*i. e.*, "not from the onworking of man's natural self-regarding impulses." The limitations in Christ's ethical teachings, Mr. Salter finds, *at least as far as the ethical requirements of our own day are concerned*, to be (1) His failure to emphasize "the intellectual virtues," straightforwardness, etc.; (2) His lack of concern with the State. Says Mr. Salter: "Jesus was not concerned with the State, indicating neither ideal nor practical courses for it to follow." He was ever looking for a kingdom to come, which, says Mr. Salter, has proved one "of humanity's blighted hopes;" (3) Mr. Salter finds in Christ's teaching little guidance for industry; and (4) no clear presentation of an ideal to be the end of human existence.

But (b) there is another conception of Christ held by those who deny the deity of Christ, very different from and at almost every point opposed

to the conception we have just noticed. This is the conception that

A Social Reformer. prevails largely among working men outside of the Church, and especially among materialistic socialists. To such minds Christ was pre-eminently a social reformer. He is the first socialist. They term Him the good "*Sansculotte*," to use Camille Desmoulin's phrase of the French Revolution. "The First Representative of the People" were the words written beneath the pictures of Christ that were posted in the halls of the French communists of 1848. The Carpenter of Nazareth is the name dearest to many working men. According to this conception, Christ was a Jewish labor leader, a religious trade-unionist, who taught of a kingdom of brotherly love, where inequalities and oppression were to vanish; where the poor, the weak, the unfortunate were to overthrow the kingdoms of wealth and of injustice. For opposing the rich and preaching communism He was crucified by the chief priests exactly as the pastors of the churches of wealth to-day oppose socialism and would hang all revolutionists—so this conception holds. Christ, argues Austin Bierbower, in his *Socialism of Christ*, sought to establish a kingdom in the interest of the "outs," of the ruled as against the rulers. He proposed to re-

verse existing conditions—to "lay the axe unto the root of the tree," "to put down the mighty from their seat," "to scatter the proud in the imagination of their hearts," "to send the rich empty away," "to fill the hungry with good things," "to exalt them of low degree." Christ's miracles, says Bierbower, "were all done in the interest of the poor." "The common people heard Him gladly." His command was to give up "houses and lands for the kingdom of God's sake." He said to the rich young man, "Sell all that thou hast, and distribute to the poor." The leading clergy Christ called hypocrites and whitened sepulchers. Christ's method, says Bierbower, was one of revolutionary force. He was an insurrectionist, who could be confused with Barabbas. He came "not to bring peace, but a sword." He prophesied a reign of terror. Jerusalem was to be destroyed. Not one stone was to be left upon another. Pilate accused Christ of stirring up the people. This insurrection was to establish a communism. In Christ's teaching all men were to be equal. "Call no man master." There was to be no more clean and unclean. Men were to live in simplicity, to "take no thought for the morrow;" not to have two coats. Many working men think that Christ was an Essene, or at least the founder of a communistic sect like the Essenes, of which the Orient was then full. According to Osborn Ward's *The Ancient Lowly*, Palestine was in the time of Christ full of trade-unions or secret guilds of slaves and despised artisans, and to these organized laborers Jesus Christ appealed, entering into their life and carrying their principles of fraternity and equality through the world.

Working men are not surprised that Christ was crucified. "The cross and hemlock cup have ever been the reformer's reward." Such is the materialist reformer's conception of Jesus Christ.

II. We come to the views of those who hold that Christ was more than man—God manifest in the flesh. Here again we find two divergencies. According to the one view, (a) Christ's message was only to the individual and at most to the Church, the body of the redeemed who have been made one with Him.

The holders of this view do not deny that Christ's teachings affect society, and are to be applied in the State; but they hold that the State and society are to be influenced only through the individual. "Make," they say, "perfect men and women, **The Individualist View.** and then you will have a perfect so-Individualist city." Many, it is true, do not hold that society as a whole ever will be perfected on this earth, at least not in this present dispensation. The kingdom of God, they reason, is to be composed of the redeemed and the elect out of the world. The kingdoms of this earth are, they teach, not to be conformed to the law of God, but to be destroyed and replaced by the kingdom of heaven. It is "a mistake," said the Bishop of Peterborough, at the diocesan conference at Leicester, England, October, 1889, "to attempt to turn Christ's kingdom into one of this world." The *Regnum Hominis*, he argues, can never be the *Civitas Dei*; the State does not and cannot

exist on Christian principles. Did not Christ Himself say, "My kingdom is not of this world"? Were not Christ and all His disciples continually speaking of and looking forward to the end of the world, its destruction, and the coming of the new heavens and the new earth? Christian socialists, says this school of thought, forget the doctrine of the second Advent, the personal coming of Christ, when this earth shall be destroyed and the redeemed only be saved out of it; or a New Jerusalem coming down from heaven. However, not all who hold that Christ's message is only to the individual argue from it that Christ's life is not to be applied to present social organizations. They hold that the Christ life will and inevitably must transform, nay, even revolutionize, human society. They assert strongly that Christ is the Savior of society; but they hold that the transformation and salvation of society is to come only through the new Christ life in the individual, by creating better men and women to compose the State. Such thinkers deny that Christ was a socialist in any sense implying that He has a message for the State apart from the individual. Says Dr. Lyman Abbott, in his *Evolution of Christianity*: "It has been said that Jesus Christ was the first socialist. This is certainly an incorrect, if not an absolutely erroneous statement. It would be more nearly correct to say that He was the first individualist. The socialist assumes that the prolific cause of misery in the world is bad social organization. Christ assumed that the prolific cause of misery in the world is individual wrongdoing."

The First Individualist.

Those who hold this view argue that Christ came to save the world by saving individuals. Individuals, indeed, may cooperate in all kinds of reform and charitable society; they may and they should enter into politics; but the redeeming power is ever in the life of Christ in the individual heart, and the Church's prime message, like Christ's, is to the individual. A few, like Tolstoi, carry this view to such lengths that they may be called, as occasionally they call themselves, Christian anarchists. They would away with organization. To obey the State is to take an oath of loyalty, and Christ said, "Swear not." Society can only be saved by personal sacrifice. Self-sacrifice is the one word. Renounce life and you gain life. (For a full statement of this view of Christ, see Tolstoi.)

But lastly, we come (b) to the view of Christ held by Christian Socialists. (For a statement of Christian Socialism, see that article.) We are here concerned simply with the view of Christ held by this school.

The Christian Socialist View.

According to this conception, Christ is God manifest in the flesh, the natural King and Head of all humanity, and therefore with jurisdiction over all life, secular as truly as spiritual, political and social quite as much as individual. It is true that men have rebelled against God's rule, and must personally return to Him. Christian socialists do not deny, but assert the necessity of personal conversion and the new birth. Christ does not force any man to serve Him. A forced righteousness is not righteousness. Christ draws but does not com-

pel any man to follow Him. Hence all moral action from men in a sense commences with the individual, and in this sense Christian socialists are individualists; but they deny that Christ came *only* to the individual; they deny either that Christ came only to save individuals out of a lost world, or even to save the world through the working alone of a new life in individual hearts. They do not admit that Christ taught that "individual wrongdoing is the prolific cause of misery in the world." They hold that man is born in society, and in a sinful society, which fact is the cause of deep evil. Throughout the Bible they find a teaching of racial sin. The child suffers for the father's sin, and the mother suffers in the child's wrongdoing. They find a socialism in sin as well as a socialism in Christ. Men, they hold, are not alone; men are molded by inheritance and by environment. Now, Christ, as the King of all the world, came to change this. He came to save rebellious individual men, but also to establish a new environment. He came to found a kingdom. He prayed for its coming. He taught that God's will should be done on earth even as in heaven. Those who argue that Christ's message is only to the individual, that He took no notice of the State and that He cared little for organization, forget, say Christian socialists, Christ's whole relation to the Old Testament and the world. The Old Testament is two thirds of the Bible. Christ only came after a long preparation of the Jews in social righteousness. He came, He declared, to fulfil the Old Testament laws. He Himself fulfilled and bade His disciples to fulfil every minute detail of the ritual law. Christ indeed denounced and reproved the rulers of the Jewish Church, but it was not because they fulfilled the law, but because they did not fulfil the law, because they made it of no effect through their traditions. Jesus Christ was the great conformist. He was circumcised; He was baptized; He was made a Son of the Law; He kept feast and fast; He obeyed all the law; He bade His disciples obey even the very priests He denounced. As to the assertion that Christ did not recognize the State, men forget what the Hebrew Church was. It was a State almost as truly as a Church. It was a Church State. Christ paid little heed to the Roman heathen State, though He obeyed even its laws; but He magnified the ideal of the old covenant, the Divine State, the heavenly kingdom. He was ever speaking of it. Of it are most of His parables. He came to fulfil its laws. It is true that Christ idealized, spiritualized the materialistic conception of the laws held by the Jews. He came to fulfil them through love, not through legalism. But He did not come to abrogate the laws. Law must fulfil law, not destroy law. Spirituality is not to make men disregard matter. Never did any one ever honor the material body as did Christ. Almost all His works were works of healing to the body. They were almost all secular socialist works. He who thus magnified the body, law, organization, cannot be said—so Christian socialists argue—to have come simply to save people out of a wicked world into heaven, or even to save a world on earth simply through

Not a Law-breaker.

the individual. If society, organization, the nation, count for nothing, why the thousands of years of the old covenant before Christ came? The law is the schoolmaster to lead to Christ, and Christ is the great Teacher to help us fulfil the law. Christian socialists agree with the material socialists that Christ was a social reformer—the social reformer; that He did come to establish a reign of equality, brotherhood, communism here upon earth. They believe Christ's Church to be the world's first International; they call the Magnificat "the hymn of the universal revolution." Christian socialists disagree with the materialist socialists that He appealed to force or *depended* simply on organization. He came to bring a sword in the same sense only that the knowledge of the law brings forth sin. Christ has made a man's enemies those of his own household; He has turned the world upside down. He is the great revolutionist. But His appeal is not to force. He did not come to draw the sword any more than the law bids men to sin. He was led as a lamb to the slaughter. He conquers by self-sacrifice. His method is the cross. His kingdom is not of this world, but it is to include this world. "The kingdoms of this world are to become the kingdom of our Lord and of His Christ" (Rev. xi. 15). As for the Second Advent, it is not for us to know the times or the seasons; but Christ certainly strove to help the bodies as well as the souls of men in His day. He entered into social organization and the Church State, and bade men in love fulfil its laws. He whose constant word was of a kingdom can scarcely be called, say Christian socialists, an anarchist. He who bade men fulfil a law that forbade private property in land, and outlined a socialist theocracy, can no more, they argued, be considered a Christian individualist. They believe His relation to social reform is best summed in the twofold conception contained in the phrase "Christian Socialism."

CHRISTIAN COMMUNISM. See COMMUNISM.

CHRISTIANITY AND SOCIAL REFORM.—We consider in separate articles CHRIST AND SOCIAL REFORM, THE CHURCH AND SOCIAL REFORM, and CHRISTIAN COMMUNISM. We are concerned in this article not with what Christ taught nor with what the Church has done or has not done in regard to social reform, but with what as a matter of fact has been the effect of Christianity upon social problems, and with what are the principles of a Christian sociology. We shall consider our subjects in two parts: (1) historically; (2) ideologically, or concerning Christian sociology.

I. HISTORY.

For a statement of what has been the effect of Christianity upon society, we condense, for the most part, Mr. C. L. Brace's valuable *Gesta Christi*.

The first effect of Christianity upon society was to introduce a new spirit of brotherhood, of equality, and of humanity to the suffering and the lowly (see CHRISTIAN COMMUNISM). Outside of Judea, at least, it seems probable that up to the third century Christianity spread largely among the vast slave and despised population of the empire, perhaps mainly among the trade *sodalities* or *colleges* or brotherhoods or communes, with which Mr. C. Osborne Ward shows the empire was honeycombed (see GUILDS). Spreading mainly among these, the enslaved rather than the masters, it is evident that Christianity could not at once overthrow slavery; but it did what it could to elevate the position of the slave. It bade him submit, in the spirit of Christian love, to his master, and yet it treated him as an equal and a brother. It inculcated a spirit and *practice* of brotherly love. "How those Christians love one another!" is the suggestive exclamation concerning life in the primitive Church. For a beautiful tho imaginative picture of the life of the early Church, see Koun's *Artus the Libyan*.

Coming to more authoritative and established facts, we can see the evidence of the social effect of Christianity by comparing legislation before and after its influence began.

THE ROMAN PERIOD.

Rome, like all early civilizations, gave almost unlimited power to the father. He could and often did chastise and even slay an adult son. He could take his property, assign him a wife, divorce him when married, transfer him to another family by adoption. See *Val. Max.*, v. 8; *Liv.*, vii., 7; *Plut.* (*P. Gr. et Rom.*). Over the daughter he had still further power. Under the Christian emperors, whatever their personal character, this was abridged. Constantine punished a parricide, and Justinian went much further. The father could now only inherit from a son to a less degree than the son's minor children. Under Justinian the son had full control over all his acquisitions. He could not be killed, exposed, bought, sold or imprisoned, save by decree of the courts. Under old Rome, inheritance was not by blood, but by *power*. Relationship was limited to descendants by males, tho a daughter inherited equally with a son. But neither an "emancipated" son nor a married daughter who had "left the family" inherited. They were *cognates*, not *agnates*. Under the Christian emperors this distinction disappears. Under the old Roman law, the woman was almost wholly under the tutelage of her male relations. She could not intervene in the management of the family, nor in commercial affairs. A court of her relatives could try her. Her husband had power of life and death over her, and power over her property. To the three ancient forms of Roman marriage, the *confarreatio*, or religious, the *coemptio*, or civil, and the *usus*, or without ceremony, there was gradually added "free marriage" in the interest of the woman, which was recognized by law, but did not make the wife of the husband's "family," leaving her her own property, her own gods, and her old family relation.

Under the Christian emperors this was changed. "Tutelage of women must be done away with," say Justinian's *Institutes*. The absolute power of the husband ceased. If unjustly divorced, she received full paternal power (*C. Theod.*, v. 4, 5).

Under old Rome, divorce had become common and frequent to the utmost. Juvenal declares that "no crime or deed of lust was wanting to the age" (*Sat.*, vi., 223). Modesty was held to be a presumption of ugliness (*Plut. Vet. P. Aem.*). In the years 10 A.D., the Roman senate had to pass a law that no woman of a certain rank could make her person venal. (*Tac. Ann.*, 2, 83). In 330-331 A.D., however, a wife might be divorced from her husband only when he was a murderer, a magician, or a violator of tombs. The husband could be divorced when the wife was an adulteress or given to evil practices. If the wife's innocence was proven, she had right again to all the property of her husband, and even the *dos* of the second wife. A married man was prohibited (340 A.D.) from having a concubine, and finally adultery was punished by death. Justinian's code, however, extended the causes of divorce. Jerome confesses that "some were the laws of the Cæsars, and some of Christ." A stoical jurist, Paul, writes in the third century: "Women in every kind of affairs and obligations, whether in behalf of men or women, are prohibited from having any concern" (*Paul Sent.*, ii., xii.). Justinian says that nothing in human affairs is so much to be venerated as marriage. "We enact

The Family.

Marriage.

then that all persons, so far as they can, should preserve chastity, which alone is able to present the souls of men with confidence before God" (*Adv.*, iii., 1, 14).

In ancient Rome and Greece, unnatural vices became the rule even among the learned (confer Lucian, Apuleius, Arbiter, Athenæus, Plato's *Symposium*, and others). The plain words of St. Paul are well known. The Theodosian code, which codified the legislation of Constantine, ordered the most intense punishments on those guilty of such crimes. He says: "Taught by the Holy Scriptures, we know what a just punishment God inflicted on the inhabitants of Sodom" (*Cod. Theod.*, ix., tit. 7).

Slavery was probably never worse than just before the advent of Christianity. Stoicism mildly denounced,

but did not alleviate it. Cato approved

of selling a sick slave (*De remol.*, II.).

Six hundred slaves were put to death

because one had slain their master, and

Cassius defended the act, which the law

required (*Tac. Ann.*, xii., lib. 42). Similar

inhumanities are well known. Slaves were fed to fish and put to death for amusement. Under Christianity the Lord's day became a day appropriate to emancipation (*Cod. Theod.*, I. 2). The setting free of slaves became common. In 312 A.D. the poisoning of a slave or branding him was declared by law to be homicide. In 314 liberty was a right which could not be taken away. By 316, emancipation in the church before witnesses was emancipation before the law. Later a few words from a priest could emancipate. Under Justinian those who served in the army or entered a monastery, with the consent of their masters, became free. Slavery was suppressed by penalty. If, at the death of the master, the heir was directed to free one slave, all became free. The marriage of the master with a bond-woman freed and legitimized all the children, and even without marriage, if the woman held the position of a wife, she became free with her children. The violation of a slave woman was made an equal offence with crime committed upon a free woman, and punishable by death. The movable property of slaves became their own, and with it they often purchased their liberty. The code declared its purpose "to have the republic frequented by freemen rather than liberated slaves." These were but the principal enactments.

Under Leo (477) all slaves on imperial domains were allowed to do with their property as they chose. If property reverted to the State (867), the slaves became free. In the ninth century, Saint Theodore of Studium (Constantinople) commanded, "Thou shalt possess no slave, neither for domestic service nor for the labor of the fields, for man is made in the image of God" (Wallon's *Hist. de l'Esclavage*, v. iii., p. 484). Slavery had disappeared in Europe when the Reformation came.

The gladiatorial games of Rome are well known. The Stoics objected to them, but it did no good. Cæsar had 320 pairs of gladiators at once in the arena. Trajan surpassed all in forcing 10,000 prisoners and gladiators to contend for life in a carnage lasting 123 days. Constantine, in the very year before he accepted Christianity, exposed a vast number of prisoners to wild beasts in the amphitheater. The early Christians protested against all this. In 325 A.D. Constantine passed the law, "Bloody spectacles in our present state of civil tranquility and domestic peace do not please us, therefore we order that all gladiators be prohibited from carrying on their profession" (*Cod. Theod.*, lxxv. tit. 12, l. 1). Their final abolition by the leaping into the arena of the monk Telemachus (404) is well known.

Under old Rome public spectacles were licentious as well as bloody. Nude women were made to bathe before the spectators. The actresses were prostitutes and the plays obscene. The Christians denounced these, as they did the gladiatorial shows. By 343 no Christian woman, bond or free, could be forced to serve as a prostitute on the stage. Exhibitions were forbidden on Sundays and saints' days. By 439 a law of Theodosius forbade the profession of the *leno*, or procurer. Under Justinian no woman could be retained by force on the stage. Under Theodosius it was forbidden to sell or train women for social entertainments. A slave mutilated became free. Often when examined a slave would answer, "I am not a slave; I am a Christian; Christ has freed me."

Under ancient Rome, the exposure and frightful mutilation of children, and especially of female children, were frequent. Even Seneca approved of exposing weak infants. Exposed children were often taken to be prostitutes. The Christian fathers were full of denunciation of the custom. Constantine (315) forbade the practice, and had his revenue and treasure used to rescue any who

were exposed. The Council of Nice ordered the foundation of hospitals in the principal towns. Houses of mercy for children were founded by Justinian. A marble vessel was provided for exposed children at the door of each church, and nurses were employed for them.

Under Constantine began the first prison reform, and with the Christians the first active condemnation of war and the adoption of arbitration. Many of the Christians refused to fight or to go to law. Tertullian called Christians "priests of peace." The first hospital is said to have been built in Rome at the end of the first century. Pulcheria, sister of Theodosius the Younger, built and endowed several at Constantinople.

THE MIDDLE AGES.

It is often claimed that the elevation of woman under the Christian emperors could not have been due to Christianity, because the same elevation was found in unchristian Germanic tribes. But the same elevation was not found. The woman occupied a higher position than under ancient Rome, but not so high as under Christian Rome, and when Christianity conquered these tribes, her position was very much bettered. It is true, according to Tacitus, that woman among these tribes was the companion of her husband, and often the honored prophetess; that a high ideal was maintained of female purity, and that the debauchery of Rome was unknown; nevertheless the wife was under the absolute authority of her husband, and could be bought, beaten, or killed. The wife was usually bought, being rated at so many pieces of silver. The offender was required by law simply to pay the husband for the adultery of his wife, and to furnish a new wife (*Leg. Ethel.*, 32).

Christianity immediately strove to increase the sanctity of marriage. The law of Æthelred is striking: "And we direct very earnestly that every Christian man carefully avoid unlawful concubinage, and rightly observe Christian law; and let it never be that a Christian man marry within the fourth degree, nor have more wives than one as long as she may live, whoever will rightly observe God's law, and secure his soul from the burnings of hell" (*Lex. Ethel.*, v., II., vi., II.). The Pepin and Charlemagne capitularies are equally strong on the indissolubility of the marriage tie, save for the cause of fornication. The Church strove likewise to root out the old venal character of marriage. The Council of Treves (1227) forbade the relations of the bride from taking money under any pretense for giving the woman in marriage. The ring is now well-nigh the only relic of the ancient *wed* or pledge that the man would fulfil his part of the money contract. France was the first to abolish tutelage.

A greater effect of Christianity on the Germanic tribes was in the mitigation and finally the suppression of personal feuds. In barbaric society individual injury was revenged on the person of the enemy, and the injured, being a member of a family or association, was protected by the association, and his wrongs regarded as wrongs done to the family. Hence arose feuds (*faida*). In the Teutonic tribes an elaborate system of fines, or amends, was arranged. Christianity agitated the subject. King Alfred, in the introduction of his laws, speaks of the ordaining of *bot*, or money fines, to repress feuds by the legislative assemblies of England as a special effort of the Christian faith. All Sundays and religious days became sacred from feuds. In the seventh and eighth centuries a confessor at shrove-tide would refuse absolution to a man at feud who would not make peace. From a Russian code of 988 A.D., we learn that "King Wladimir lived in the fear of God, and murders waxed greatly. Then spake the bishops to Wladimir: 'Murders wax greatly. Why dost thou not punish?' He answered: 'I feared injustice.' But they replied: 'Thou hast been set by God for the punishment of the wicked and for grace to the good. It becometh thee to punish the murderers, but only after much searching out.' Then Wladimir rejected *wergild* (fine), and punished the murderers."

From feuds arose private wars. A nobleman once declared war against the city of Frankfort because a lady residing there had promised a dance with his cousin, and had danced with another. The city was obliged to satisfy his wounded honor. The Margrave of Brandenburg boasted that he had burned 170 villages. A church council held near Soissons in 909 A.D. declared "that the monasteries were burned or destroyed, the fields reduced to solitude, so that we can

Slavery.

Marriage.

Humanity.

truly say that the sword has pierced to the very soul." Wherever feudalism went there was private war.

"The Peace of God."

Consequently, the clergy preached "the Peace of God." In France in the tenth and eleventh centuries there seems to have been a sort of peace "revival," almost "a crusade of peace." Whoever broke the "Peace of God" lost his property, and was driven from among men. The peace lasted from Thursday evening to Monday morning, and included Christian feasts and other festivals. Many religious fraternities to reconcile enemies were formed in the Middle Ages. A meeting of clergy at Charons (883 A.D.) anathematized all who should plunder the poor and the clergy. The Council of Poitiers, 1004 A.D., worked for the same end. By the Council of Limoges (1031) all disputes were to be brought before the bishop and his chapter. The popes made public proclamations of peace. Almost all the councils reaffirmed this peace. In the thirteenth century Brotherhoods of the Agnus Dei worked for peace. In the same century Friar John of Vicenza traversed large portions of Italy, preaching the "Peace of God." In the fourteenth century a great religious movement for peace stirred the minds of different nations. Pilgrims with white bands around their necks (*I Bianchi*) marched through various lands preaching the duty of a Christian peace. In Germany the Church and the free cities combined, and in the twelfth and thirteenth centuries largely introduced courts of arbitration under the bishop in place of feuds.

The capitularies of Charlemagne are replete with evidence showing the effect of Christianity in the way of social reform. One of them reads: "Let peace and good intelligence rule among bishops, abbots, counts, judges, and men of all conditions, for without peace, nothing pleases the Lord." "If ye love one another, all will know ye are Christ's disciples." "Widows and orphans and minors are to be protected as under the peculiar care of God." "The true charity, which loveth God and our neighbor," is to be cultivated. The people are exhorted to peace, because "they

Charlemagne's Capitularies.

have one Father in heaven," and because the blessed book has taught them that "blessed are the peacemakers." The powerful are cautioned against the oppression of the poor, and all are exhorted to be imitators of Him who would save the souls of men. All Christians are most solemnly warned to give their utmost diligence lest they be forever separated from the kingdom of God by their strifes and contentions and falsehood and wicked vices. The laity were ordered to learn the Apostles' Creed. The stranger and far-comer were especially protected "under the injunctions in the Bible, and because such may be journeying in the service of their common Master."

Similarly indicative of the influence of Christianity are old English laws. King Alfred (about 870 A.D.) introduces his code with the ten commandments and other laws taken from the Bible. Of his laws, the King says: "These are the dooms that the Almighty God Himself spake to Moses and bade him to hold, and when the Lord's only begotten Son—that is, Christ the Healer—on middle earth came, He said that He came not these dooms to break nor to gainsay, but with all good to do and with all mild-heartedness and lowly-mindedness to teach them" (Hughes' translation). "That ye will that other men do not to you, do ye not that to other men. From this one doom, a man may think that he should doom every one rightly; he need keep no other doom-book." The Saxon and early Norman laws are strict as to Sunday work. If a bondsman work on Sunday by his lord's order, the lord must pay a fine of 30s.; if without this order, he must be flogged. If a freeman work without his lord's order, he must forfeit his freedom or pay 60s. A priest pays double. In King Ethelred's dooms the Christian impulse is very strong (978 A.D.). "This, then, first, that we all love and worship one God and zealously hold one Christianity; . . . that every man be regarded as entitled to right, and that peace and friendship be carefully observed within the land before God and before the world." King Canute's laws (1017 A.D.) are similar: "Let every Christian man do as is useful for him; let him keep his Christianity," etc.

English Laws.

Christianity in the Middle Ages did much for education. The Council of Vaison (529 A.D.) says: "It hath seemed good to us that priests with parishes should receive into their houses, according to a sound custom in Italy, young readers to whom they give spiritual nourishment, teaching them to study, to attach themselves to

holy books, and to know the law of God." The Synod of Orleans (790) says: "Let the priests in villages and towns hold schools, in order that all the children entrusted to them can receive the first notion of letters. Let them take no money for their lessons" (*Theod.*, cap. 20). In 859 another council declared: "Let one raise everywhere public schools, that the Church of God may everywhere gather the double fruit of religion" (*Conc. Ling.*, cap. 10). The Council of Trent commands that the children of the poor have at least one master to teach poor scholars grammar gratuitously" (*Conc. Trid. occ.*). Charlemagne had already said: "Let one open schools to teach children to read; let, in every monastery, in every bishopric, some one teach psalms, writing, arithmetic, grammar, and employ correct copies of holy books; for often men seeking to pray to God, pray badly on account of the unfaithfulness of copyists" (*Cap. Ecc.*, 61-66).

All these exhortations, and there were many more, had the effect of multiplying schools. The contribution of the monasteries to education is well known. An immense quantity of manuscripts was copied. Thomas à Kempis said of this copying: "Do not trouble yourself at the fatigue of your work, for God, who is the source of every good and just labor, will give the reward, according to your efforts, in eternity. When you shall be no more, those who will read the books copied by you with elegance will pray for you; and as he who gives a glass of cold water does not lose his reward, so he who gives forth the living water of wisdom will receive more surely his recompense in heaven." All classes studied in these monastic schools, so that rich and poor were brought together on the field of learning. Nor were the popes altogether wanting to the intellectual movement.

Equally was the Church effective in behalf of liberty. Medieval serfdom sprang from the chaos of the times. Freed slaves found themselves unable to protect themselves. They preferred to join themselves, as land-slaves, to some master. The small farmer found himself better guarded from robbers by becoming the serf of some powerful nobleman. Wealthy patrons at Rome rewarded their faithful clients by bestowing on them parcels of land in the provinces, where they were attached as *coloni* to the soil. Again, the government settled bodies of prisoners or immigrants on large districts of public land, and made them serfs to the soil. These *coloni* were considered as free born, but attached to the estate. They could not marry nor teach their children without the consent of their lord, though they could become priests. They had a little cottage, a little land, pasturage and fuel, and Rogers says (see SERFS) rent free. The estate could not be sold without them, nor they sold from the estate. They paid no taxes.

Serfdom.

The laws of Constantine forbade the separation of near relatives among slaves of the soil. Slavery, however, still existed. Up to the twelfth century there was an absolute power of the master over the life of the slave. For these and for the serfs the Church did much; 37 Church councils are reported to have passed acts favorable to slaves. In 305 A.D. any master ill-treating his slave was condemned; in 517 the murderer of a slave was excommunicated; in 549 the right of asylum in a Christian church was offered to the runaway, and slaves freed by the Church were protected; in 585 the ornaments and property of the Church were permitted to be sold for ransoming slaves; in 566 Christians were forbidden to reduce free men to slavery; in 922 no Christian was permitted to enslave a fellow-Christian; in 656 any slave compelled to work upon Sundays became free by the fact, or if he were held over the font for baptism. The decree of the Council of Chalons (650 A. D.), with 44 bishops in session, ordered that no Christian slaves should be sold outside the kingdom of Clovis, with the words: "The highest piety and religion demand that Christians should be removed entirely from the bonds of servitude." One form of manumission was "For fear of Almighty God and for the cure of my soul I liberate thee, and may the angel of our Lord Jesus Christ deem me worthy of a place among His saints." Another form was, "I, in the name of God, thinking of the love of God, or eternal retribution, . . . do free this slave from the bonds of servitude." In the eleventh century, the Emperor Conrad speaks of the sale of human beings as a thing nefarious and detestable to God and man (*Pertz.*, xi., 38). In the fourteenth century the Count of Valois, brother of Philip the Beautiful, freed the serfs of his *comté* with the words: "As the human creature who has been formed in the image of our Lord ought to be free by natural right, . . . let

Slavery.

these men and women be free. . . ." In 1266 the city of Bologna freed all its serfs, paying an indemnity to their masters, closing the decree with these remarkable words: "The city of Bologna, which has always combated for liberty, remembering the past, and its eyes fixed on the future, in honor of our Savior Jesus Christ hath ransomed all the serfs on its territory, and decreeth that it would not suffer there a man not free" (*Historia di Bologna, Girarhacci*, quoted by Laurent Sugenheim and von Raumer, vol. iii., p. 168). In Germany, the *Sachsenspiegel*, or Mirror, the code of the thirteenth century, is full of the traces of the influence of Christianity against slavery. The Lord is said to have "put rich and poor equally under His love." Slavery is declared to have its origin "from unjust captivity," and, quoting the Bible, the law affirms that man belongs to God alone, and "whoever holds him as slave, sins against the power of the Almighty."

One of the first Christian kings of Norway, Knut the Holy, at the end of the eleventh century publicly proclaimed that slavery should be abolished. By 1214 it had almost ceased, and by the fourteenth century there are no traces of it. In Sweden, King Magnus Erikson, 1355, made a similar proclamation. In England, as upon the Continent, slavery arose from many causes—birth, captivity, punishment, poverty. Thousands of Britons, in the first century after the Norman conquest, sold themselves into thralldom. Children were sold by their parents. Bristol was the great slave market, and there might be seen long trains of British youths and maidens—the latter often received for the sake of selling their offspring—all to be sold either to Ireland or to foreign countries. One authority says that from Æthelwulf to William I., for 230 years, a great part of the English peasantry became reduced to slavery. By the Doomsday Book (1068-71 A.D.), the number of male slaves in Sussex was 9200, which would make the whole number about 50,000, while the freemen were only about 38,000. In the whole of England there seems to have been 25,000 slaves, 89,000 serfs, and 110,000 villeins. There is proof that slaves were branded and yoked as cattle.

Christianity strove against this evil. Bishop Wulfstan, of Worcester, about 1086, came yearly to Bristol and spent several months preaching against the slave

Slavery in England.

trade. Edward the Confessor, 974 A.D., said of Christian brotherhood: "We have all one heavenly Father and one spiritual mother, which is called Ecclesia—that is, God's church—and therefore are we brothers." St. Aidan, of Northumbria, ransomed slaves. Bishop Wilfred having received an estate with 250 Christian slaves, emancipated them. Laws were enacted in behalf of the slaves, but always on a Christian basis. Some of these we have seen. A female slave led into sin by her master, by that act became free. The Seven Years' Jubilee, taken from the Jewish system, did much to destroy slavery in England. Under William I. the law forbade the slave trade. A council in London (1102), called by Anselm, forbade absolutely the nefarious business of selling human beings like brute beasts. The chivalry of the Middle Ages owes much, at least, to Christianity. The initiation of the knight was essentially religious; his ideals were largely so. His first oath was often "to fortify and defend the Christian religion to the uttermost of my power." Similarly the crusades and much of the life of the first period of the military orders like the Knights Templars were largely influenced and formed by Christianity, and were undoubtedly largely for good. The effect of the monastic life upon equality is noticed under the article COMMUNISM. Christianity and the Church did far more for civil liberty than is usually recognized. It should not be forgotten that Stephen Langton, Archbishop of Canterbury, was the main instrumentality in forcing from King John the priceless Magna Charta. For the part played by John Ball and Wycliffe, "poor priests," see JOHN BALL. The social influences of Savonarola in Italy, who can estimate? The democracy of the Church certainly influenced the political movement. For the development of this subject, see the second portion of this article. We come now to

THE PERIOD OF THE REFORMATION.

The first social effect of the Protestant Reformation, with its emphasis upon the right of private judgment, salvation by personal faith, the worth of the individual soul, was the outbreak of a struggle for social freedom. In this struggle Germany took the lead (see PEASANTS' REVOLT). Many associations among the peasants were formed. One is spoken of on the Upper Rhine, which had a banner with a picture of Christ

crucified, before whom knelt a serf with the legend, "Nothing but God's justice." The Swabian peasants, in the insurrection of 1525, said: "It hath been the custom till now to hold us for serfs, which is a pity, seeing that Christ hath bought us and redeemed us with His blood;" and, "It is found in the Holy Writ that we are free, and we . . . desire to be free. We would have God as our Lord, and know our brother in our neighbor."

The fourth article claims on religious grounds the use of wild game and wood from the forests. In conclusion say the peasants, "If any of these articles are opposed to Holy Writ, and this can be proven to us, we will give them up. The peace of Christ be with us all." The peasants on the Neckar claimed under the emperor an absolute equality for all men. "All worldly lords are to be reformed, so that the poor cannot be burdened by them beyond the rules of Christian freedom; the same law is to be for the highest and lowest." "All cities and parishes are to be reformed in divine and natural rights, after the principles of Christian freedom" (see also ANABAPTISTS; CHRISTIAN COMMUNISM, etc.). Such was the first social result of the Reformation. But it did not endure. The leaders of Protestantism soon became too much engaged in the discussion of doctrines to lay great stress upon social rights. Protestantism became engrossed in "other worldliness." It is not to be denied that the preaching of the right of private judgment and the value of the individual had far-sweeping social and political influence. John Fiske says of Calvin, for example: "The spiritual father of Coligny, of William the Silent, and of Cromwell must occupy a foremost rank among the champions of modern democracy." Liberty owes indeed a great debt to Protestantism, however much Protestants hung and burned and tortured those who did not believe with them according to the spirit of the times. Plymouth Rock is a truer outcome of Protestantism than the persecution of the Salem witches. In the words of Cromwell, "They that trusted God for the liberty of conscience could venture life for the liberty of country." Protestantism against Romanism meant to Protestants, very largely, liberty against absolutism. Nevertheless, Protestantism soon turned against the common people. Luther was against the German peasants. Others than Milton found that "new presbyter was but old priest writ large." Protestantism has stood for political liberty, but not for social reform. What Christianity accomplished for social reform up to the Reformation was accomplished largely through the Church. Since then it has been mainly through individuals, in spite of the Church. The Reformation produced in the Church of Rome, it is true, somewhat of a counter reformation, but the effect upon her, as upon the Protestant mind, was mainly doctrinal, and the Church, both Protestant and Roman, largely forgot to apply its Christianity. The opening of the new world, and especially of the gold mines of the new world, produced a revival of greed and of mammon worship, and led to the horrors of a modern slave traffic, that has endured 400 years. The first considerable cargo of slaves seems to have been brought in 1444, under Prince Henry of Portugal, by a Portuguese captain from the coast of Guinea. Charles V. granted in 1517 a monopoly to Governor de Bresa to import 4000 negroes during eight years into the Spanish colonies, but in 1542 the monopoly covered 23,000 slaves. In 1700 a Spanish treaty with a Portuguese company of Guinea stipulated to furnish 10,000 tons of negroes. The treaty of Utrecht (1713) gave Great Britain a monopoly in the slave trade for 30 years, from 1713-43, and during this period the British Government agreed to import 144,000 negroes of both sexes into Spanish America at 3½ piasters per head. The British slave trade began under Queen Elizabeth. Certain statutes of William declared that "the trade was highly beneficial and advantageous to the kingdom, and to the plantations and colonies thereunto belonging." Between 1752 and 1762, it is estimated that 71,115 slaves were imported into Jamaica alone. During two centuries the Spanish Government concluded more than 10 treaties "in the name of the most Holy Trinity," which authorized the sale of more than 500,000 human beings. The first ship which sailed from England in 1562, under Sir John Hawkins, to buy slaves in Africa and sell them in the West Indies, bore the name of *Jesus*. In 1807 Lord Eldon said in Parliament: "It [the slave trade] has been sanctioned by Parliament, wherein sat juriconsults the most wise, theologians the most enlightened, statesmen the most eminent,"

In Germany.

Slavery.

Bancroft estimates that for one century previous to 1776, 3,250,000 negroes were torn from Africa by Great Britain alone, of whom 250,000 perished in the Atlantic from the horrors of the "middle passage," where they were chained between decks so low that they could not stand up, the living often chained to the dead. Help estimates that from 1510-1807, between five and six millions of negroes were carried from Africa by various European powers to America as slaves. The American colonies protested against it, Oglethorpe, the great founder of Georgia, declaring that they prohibited it in that colony "because it is against the Gospel, as well as against the fundamental law of England." Within two years, however, the inhabitants petitioned for slaves. Protestantism and Romanism have thus the terrible stain to bear of the approval of slavery. Yet

The Anti-Slavery Movement.

it should not be forgotten that it was mainly Christian thought that finally broke up the slave traffic and slavery itself. The Society of Friends or Quakers, both in England and America, was the first modern body of Christians to denounce and oppose slavery. As early as 1675 the devoted missionary, John Eliot, in Massachusetts, spoke against slavery, and in 1701 a petition against slavery was presented to the representatives of Boston. Among the Friends who opposed it in the eighteenth century should be mentioned Benezet and John Woolman. The great divines Wesley and Whitefield preached against it. Dr. Hopkins, a Congregational clergyman of Rhode Island, distinguished himself by his efforts against it, till in 1774 Rhode Island gave up the traffic, and in 1784 abolished slavery. The Society of Friends was, however, the only religious body which as a whole forbade the holding of slaves. The early abolition societies all took religious ground. "Nearly all," says Wilson, the historian of the slave power (vol. i., p. 230), "who engaged in the formation of anti-slavery societies were members of Christian churches." In Great Britain the opposition to slavery came equally from Christian men, notably Baxter, Bishop Warburton, Paley, Wesley, Bishop Porteus, Whitefield, and others. The first petition to Parliament against the slave trade (in 1776) was based on the religious ground "that the slave trade is contrary to the laws of God and the rights of man." The slave trade was abolished in the British Empire, 1806-7. The United States had included their judgment on the slave trade in the Constitution, but adjourned the final abolition till 1807. In England religious sentiment rose till in 1833 England abolished slavery, paying £20,000,000 to the planters as indemnity. In the United States, early Church conferences denounced slavery. The Presbyterian Synod in 1787 "recommended to all their people to use the most prudent measures, consistent with the interests and state of civil society in the countries where they live, to procure eventually the final abolition of slavery in America." In 1818 it pronounced slavery "utterly inconsistent with the law of God . . . and totally irreconcilable with the spirit and principles of Christ." Congregationalists and Unitarians went even further. The Methodist Episcopal Church in 1780 plainly condemned the system of human bondage. In 1800 the annual conference was directed to prepare an address favoring gradual emancipation. But the words were finally removed, and this was added, "Let all our preachers from time to time, as occasion serves, admonish and exhort all slaves to render due respect and obedience to the commands and interests of their respective masters."

But the conflict was as irrepresible in the Methodist Church as it afterward proved to be in the nation. At the General Conference of 1844, which was held in the city of New York, the contention took an extremely angry form. It centered upon the personal relations of one of the bishops of the Church (Andrew), who had come into the possession of slaves by a marriage which was contracted after he entered the episcopate. It was his wish and intention to resign, but he was overruled by the Southern delegates. They finally called a convention of delegates from the Southern conferences, which met at Louisville, Ky., in 1845. This body took formal action, separating itself from the Northern churches.

By this secession the Methodist Episcopal Church lost 1345 traveling and 3166 local preachers and 405,288 members. Many discerning minds regarded this action as prophetic of the same results in the organic life of the nation.

But it was true nevertheless that from 1830 to 1850 the churches as a whole were subservient to the slave

power. Dr. Albert Barnes said, "There is no power out of the church that could sustain slavery an hour if it were not sustained in it." Judge Birney called "the American churches the bulwarks of American slavery." Yet were there individual churches and clergymen not a few that battled for abolition. The clergyman Lovejoy was killed for advocating abolition. Garrison and Phillips were strong in Christian sentiment. At one meeting in Illinois, more than 30 clergymen attended and opposed the introduction of slavery into that State. During the struggle in 1823, which prevented Illinois from becoming a slave State, the clergymen were almost as one man against slavery. But whatever the position of the churches, it is not too much to say that Christianity put down slavery.

For the other social effects of modern Christianity, see CHURCH AND SOCIAL REFORM; but Christianity, if not the church (*q. v.*), has had at least its part to play in the gradual emancipation of woman, in the condemnation of war, the favoring of arbitration, in the care of the wounded in war, the condemnation of dueling, in prison reform, in the creation of hospitals and charities of every kind, and in temperance reform.

II. CHRISTIAN SOCIOLOGY.

The first note of Christianity in relation to society is that it is world-wide and international. It knows "neither Greek nor Jew, circumcision nor uncircumcision, barbarian, Scythian, bond nor free, but Christ all and in all." It taught Peter to **World-wide**, call no man common or unclean, but "that God is no respecter of persons, but that in every nation he that feareth Him and worketh righteousness is accepted with Him" (Acts x. 34). It led Paul, once a Pharisee of the Pharisees, to write to the Ephesians, "Now, therefore, ye are no more strangers and foreigners, but fellow-citizens with the saints, and of the household of God" (Eph. ii. 19). It taught the Christian Church the unity of the faith—"One Lord, one faith, one baptism, one God and Father of all, who is above all and through all, and in you all" (Eph. iv. 5, 6). One Lord Jesus Christ, "of whom the whole family in heaven and earth is named" (Eph. iii. 15). Hence Christians of every age, however they have explained it, have believed in "the holy Catholic Church," "the communion (literally the communism, *κοινωνία*) of the saints," the unity of believers, the kingdom of God. Thus Christianity, at least till the Protestant Reformation, in Catholic countries, and even under Protestant denominationalism, in a deeper-lying unity, has ever stood for the unity of man in Christ. Says Bishop Barry:

"The Catholic [not Roman] Church is a universal society, which knows no distinction of age and physical circumstance, no distinction of peoples, nations, and languages. It is no caste in the air, no mere promise of a future heaven. It is a living reality now, obviously the one, ever-growing international society; already realizing by its Bible read and its Christian worship offered in some 200 languages, the sign of Pentecost, and always advancing toward its future heritage of the world of humanity. This great unity . . . underlies all special, local, temporary characteristics; its communion is a communion of saints; its one universal tie is the indwelling of the Spirit of God; . . . its means and pledges of unity are the sacraments of communion with Him" (*Lectures on Christianity and Socialism*, p. 13). Canon Fremantle's *Bampton Lectures* (1883) bring out still more plainly the unity of the Church "as a moral and social power, present, universal, capable of transforming the whole life of mankind, and destined to accomplish this purpose." The Church he calls "the social state in which the spirit of Christ reigns, embracing the general life and society of men, and identifying itself with these as much as possible, as having for its object to imbue all human relations with the spirit of Christ's self-renewing love, and thus to change the world into a kingdom of God."

This makes the field of Christianity the world, and identifies with the coming of God's kingdom any advance in unity and in love. Says

Canon Fremantle: "All goodness is essentially one, and therefore essentially Christian." The coming of

**Its Field
all Life.**

love in all human relations is thus the coming of God's kingdom. The Jewish Church Canon Fremantle therefore calls a training in national righteousness. The early Christian Church he considers the beginnings of the universal society. The imperial and medieval Church a united Christendom attempted. The medieval theory of Christendom he thus states: "Christendom forms one great whole, in which there are two chief functionaries, the Pope and the Emperor, each in a different way its head. Each power is instituted by God. The one is to rule over man bodily, the other over his spiritual interests. Both spring from the old Roman Empire, which, having become Christian, was at once empire and Church. The two powers must support each other, both mutually necessary. The Emperor sanctions the Pope's election, the Pope crowns the Emperor; the Emperor protects the Pope and the clergy and the spiritual courts, and these in return support the authority of the Emperor over his subjects. This theory," says Canon Fremantle, "though it did not wholly correspond to the facts, had much in it, considered as an ideal, which was sound." It explains many of the crusades, is the key to Dante's *De Monarchia*, gives rise to both a Frederick Barbarossa and a Hildebrand. It gave to the world an Alfred the Great, a St. Louis, a Savonarola. The Reformation was largely a reaction toward individualism, but still it was full of efforts toward a Christianized society; and in England especially toward a Christian national-ism.

Christianity to-day is drawing together the lines of Christendom. Canon Fremantle sees its unity and universality in (1) public worship, not as a separate cult, but as seeking to raise the tone of the general life; (2) the family, the social unit; (3) knowledge, the education of all; (4) art, which must be national and popular, to gladden, not individuals, but mankind; (5) society, which must acknowledge its stewardship; (6) trade, which must learn cooperation; (7) the nation, the constitutional and organic form of the Christian spirit; (8) the universal Church or universal State, to be attained through arbitration, international law, international congresses, and federation. Into all these channels the spirit of Christianity is more and more being poured. This is Christianity leading to international socialism.

But, more definitely, what does Christianity teach as to social reform?

First, that humanity is to come into a unity of brotherly love, not by building up some new scheme of universal brotherhood, but by the recognition that mankind is to-day a unit in the common Fatherhood of God, and may through Christ enter into united life. It denies that society can be "made anew by arrangements;" it believes that it is to be regenerated "by finding the law and ground of its order and harmony the only secret of its existence in God" (Maurice). This is the first social message of Christianity—"Return to God." Carlyle saw the need when he wrote: "The beginning and the end of what

**The
Brotherhood
of Man.**

is the matter with us in these days is that we have forgotten God." Mazzini saw it when he wrote to the working men of the world, "The source of your duties is in God," and contended that agitation conducted in the name of the rights of man had brought in up to the present day simply an increase of selfishness and individual competition. When we accept God, we have the basis and possibility of union. "There can be no brotherhood without a common father," wrote Maurice. "From that time began Jesus Christ to preach and to say, Repent, for the kingdom of heaven is at hand." To return to God is the first step in Christian sociology.

Second, Christianity declares that to do this Christ is the Way. "I am the Way, the Truth, and the Life; no man cometh unto the Father but by me." This is the second sociologic position of Christianity, that Christ is the elder Brother, the Way, the leader into brotherhood. This, as we have already seen, Christ came to be—the fulfiller of the law. He is the King made manifest, the King in man, the King on earth, the head of the body. The way to realize human brotherhood and unity is not alone to discuss Christ's divinity, but to accept His mastership, to become His follower, to join His kingdom. This is to be a Christian. Men realize this in personal salvation; but it is equally to be realized in social salvation. For Christians He is "the Man," and He must be the solution of all human problems. That is the primal creed. Not only is He, as the "Man of Sorrows," the Brother and Comforter of all who are weary and heavy laden; not only are the poor His peculiar charge and treasure, but more than that: He is Himself, in His risen and ascended royalty, the sum of all human endeavor, the interpretation of all human history, the goal of all human growth, the bond of all human brotherhood. It is in this character that He has been kept so little in practical mind; it is this office of His which is reserved to such an obscure and ineffectual background. His living Headship, as the Second Adam raised to the right hand of power, as the perfect Son of Man, this has not been brought to bear, with energy and confidence, upon the actual society which He, in this lordship sealed to Him, necessarily claims as His own. It is this extension of the fruits of the Passion over the entire surface of human life which Christian sociology emphasizes. The whole of human nature is to be brought within the sway of the "New Man." And human nature is corporate; "man is a social animal." The natural bonds which hold together men into societies and races must, of necessity, receive the new inflowing force which comes to them out of the supremacy of Him who gathers all men unto Himself.

**Christ
the Way.**

Third, it is a spiritual way. "Ye must be born again" is true of society as well as of individuals, the third point in Christian sociology. A nation's life must be from the spiritual to the material, from the inner to the outer, still all be spiritual. Not by law material but by law spiritual does God's kingdom come. This does not mean that we are only to build up God's kingdom by spiritualizing individuals alone. It was not Christ's method (see article CHRIST AND SOCIAL REFORM). We must spiritualize all life—the body, the city, State, the nation. This is the distinctive function of the Church. The national Church should be the soul of the nation, into which and through which God's Spirit may come to the nation.

**A Spiritual
Way.**

Fourth, if Christian sociology consists in society's obeying, through spiritual life, the social law of Christ, we must know that law. It is simple.

"Then one of them, which was a lawyer, asked Him a question, tempting Him, and saying, "Master, which is the great commandment in the law?"

**The Social
Law.**

"Jesus said unto him, Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind.

"This is the first and great commandment. "And the second is like unto it, Thou shalt love thy neighbor as thyself.

"On these two commandments hang all the law and the prophets" (Matt. xxii. 34-40).

Says Professor Ely: "This is a most remarkable, and at the same time a most daring summary of the whole duty of man. A human teacher would never have ventured to reduce all God's commandments to two simple statements; nor would such a teacher have presumed to exalt man's obligation to love and serve his fellows to an equal plane with his obligations to love his

Creator. All false systems of religion exalt the love of God above the love due our fellow-men, and tell us that we may serve God by injuring our fellows. How many millions of human beings have thought that they did God service by human sacrifice! 'Not only is this true, but it is furthermore true that, in proportion as believers in the true religion depart from the mind which was in Jesus Christ, they neglect the second commandment. Thus, when Christ dwelt on earth, He found men excusing themselves from duty to their fellows on the plea of higher obligation to Deity.

"The second commandment, which is like the first, means that in every act and thought, and purpose, in our laws and in their administration, in all public as well as private affairs, we—if indeed we profess to be Christians—should seek to confer true benefits upon our fellow-men. It means that the man who professes to love God and who attempts to deceive others in regard to the real value of railway stock, or, for that matter, any other property, that he may coax their money into his pockets, is a hypocrite and a liar. It means that the man who oppresses the hiring in his wages is no Christian, but a pagan, whatever may be his declarations to the contrary notwithstanding. What does God say of such an one? He says: 'I will be a swift witness against those that oppress the hiring in his wages.' What does His second commandment mean for those rich men who keep back the hire of their laborers? It means that they 'must' weep and howl 'for the miseries that shall come upon them.' And what does this message mean for monopolists who use their superior advantages of wealth or intellect, or bodily strength or other resources, to crowd out and grind down their fellows according to the methods of modern commercial competition? The prophet Isaiah shall tell us: 'Wee unto them that join house to house, that lay field to field, till there be no place, that they may be placed alone in the midst of the earth.'

"It is needless to enlarge upon this. It must be seen that the arrangements of this world are not in accord with the commandment given to love our neighbors as ourselves."

Fifth, the interpretation of this is the *Cross*. The Cross cannot be removed from Christian sociology.

The Cross.

There can be no obeying Christ without sacrifice. *Via crucis, via lucis*. "If any man will come after Me, let him deny himself and take up his cross and follow Me." This is the fifth point in Christian sociology. It is the only way to fulfil love. *Love is the leaving of self, the living in others.* Love and life and sacrifice are one. It is thus indeed that we most truly gain. But if we love and deny ourselves *for the sake of gain*, we do not love. "Whosoever shall seek to save his life shall lose it." Christian sociology is finding one's true individuality in losing it in the life of all. Therefore, luxurious bishops and priests and ministers cannot teach Christian sociology, for their lives give the lie to their words. We must become poor, if we would make the many rich.

Sixth, we come to more detailed questions. They can only be answered by those who have long passed

the merely sentimental assertion that Christ is all in all, and have set themselves to the solid task of discovering what that solemn truth really and precisely means, and have worked it down into the concrete facts, and have surveyed and estimated the full need of the circumstances, and striven to make clear to themselves what is the first step, and what the second, and the third, if that great royalty of Christ is, in very deed, ever to be made good here on earth, amid men as they are, and after a history such as they have hitherto had.

(a) Christianity must demand in some form the opening of all the earth, including all natural advantages, to all God's children equally. *How* may be a question of political and economic method (see LAND), but in some form it must be accomplished. Equity, brotherhood, and the declaration of Christ demand it. That private *property* in land was forbidden, and every Jew entitled to the *use* of land by the Jewish theocracy, is undisputable; that Christ came to fulfil the law and the prophets can no more be denied. That we must follow their *method* is not certain, but that in some way Christianity must bring to the world what Judaism required of the Jew can be denied by no Christian.

(b) Christianity demands that love and not competition be the law of trade. The golden rule must be made the rule for gold. "Competition," said Maurice, "is put forth as the law of the universe. This is a lie. The time is come to declare it is a lie by word and deed." This means that *in some form* Christianity im-

plies socialism (*q. v.*). Said Laveleye: "Every Christian who understands and earnestly accepts the teachings of his Master is at heart a socialist; and any Christian who opposes what is commonly known as Christian Socialism misunderstands Christ, or socialism, or both." The inference is not, of course, that Christianity must be committed to State socialism, but society to be Christian must in all ways conform to the law of cooperation.

(c) Christianity demands that every man able to work should work. Not otherwise can he follow the Carpenter of Nazareth. "If any man would not work, neither should he eat" is the injunction of well-nigh the oldest Christian epistle.

The Law of Labor.

(d) It follows from this and from the whole spirit of Christianity that we are not to live upon the work of others by usury. (For the detail of this argument, see USURY.)

(e) Christianity demands the enthronement of the family, in the abiding unity in love of one man and one woman. "And I say unto you, whosoever shall put away his wife, except it be for fornication, and shall marry another, committeth adultery; and whoso marrieth her which is put away, doth commit adultery." These words of Christ, with all they imply, are fundamental to Christian sociology (see FAMILY).

The Family.

(f) Lastly, Christian sociology demands that the Christian go into the details of all political, social, and industrial life of every kind, and bring them into subjection to Christ. Only so shall we be His disciples. "Not every one that saith unto Me, Lord, Lord, shall enter into the kingdom, but he that doeth the will of my Father, which is in heaven."

Into all these details Christ's spoken ordinances do not go. Christianity is not a system of ordinances. But it is a life, and into these details the Christian life must go. (For different views, see CHRIST AND SOCIAL REFORM.)

CHRISTIAN SOCIALISM is a term first used by the little band of men—clergymen and laymen—that gathered round the Rev. Frederick Denison Maurice in 1848. It was used by them to express their position that socialism was really but a development, an outcome of Christianity, and that to be effective and true it must be grounded on a definite Christian basis. What they meant by it in more detail we shall see later on. It must, however, be pointed out here that since that date the phrase has been used in different and very loose and sometimes misleading senses. It has been and is to-day used by some for any application or attempt at the application of Christian principles to social life. This is especially true of its use upon the continent of Europe by both Protestants and Roman Catholics. It is, however, more commonly and more strictly used even to-day for the position originally held by Maurice and the early Christian Socialists. This, however, is not inconsistent with the fact that almost all those who call themselves Christian Socialists, at least in England and America to-day, hold economic views in some ways materially different from the views held by the early Christian Socialists. Circumstances have changed. Social thought has developed. Socialism has changed. The same principle that led Maurice and Kingsley to take one view leads their successors to take an-

other. What these various positions are, that are united under the one general principle, will be best seen by the history of the movement. We commence with

ENGLAND.

The year 1848 was a dark one for English working men. Bad harvests, heavy taxes, the potato famine had brought to a head all their sufferings and wrongs. Ireland was on the verge of rebellion.

There were riots in more than one English town. Chartism (*q.v.*) had done its work. On April 1 there was an immense mass-meeting at Kennington Common. London was thrown into intense excitement and fear. Wellington assumed military control. Two hundred thousand special constables were sworn in.

Meanwhile, two clergymen of the Church of England, F. D. Maurice and Charles Kingsley, with a young lawyer, J. M. Ludlow, had been growing more and more interested in social questions. Charles Kingsley now rushed down from his parish at Eversley, and meeting Ludlow at Maurice's house, it was decided to publish placards and spread them broadcast, sympathizing with the workmen, but urging restraint from violence, and the necessity of virtue and religion to make men fit for liberty. Charles Kingsley wrote all that night, and the next morning appeared on thousands of posters his address to the workmen of England, signed "A Working Parson." The crisis was passed. A pouring rain and the energy of O'Connor prevented any outbreak.

It was now decided by the above three to publish a little penny weekly, entitled *Politics for the People*. In these, in addition to Maurice, Kingsley, and Ludlow, we find articles by Archdeacon Hare, Professor Conington, Sir Arthur Helps, Archbishop Whately, Dr. Guy, French, Stanley, Osborn, and others—a rare galaxy of brilliant minds. Kingsley wrote in it the well-known articles signed "Parson Lot" (see KINGSLEY). The first number appeared May 6, 1848. The columns, moreover, contained many communications from Chartists, among others one signed by "One of the wicked Chartists of Kennington Common." The paper, however, was discontinued after 17 numbers for lack of support, although it attained a circulation of 2000.

The little knot of writers, however, now including Thomas Hughes, held meetings all winter, meeting with many of the Chartist leaders, and starting night schools. It was at one of these conferences that Kingsley made his celebrated speech beginning, "I am a Church of England parson and a Chartist," in which he acknowledged the grievous wrongs of the workmen, but dissuaded them from violence.

A Mr. Mayhew at this time contributed to the London papers a series of articles on the poor and the sweating system, which called out Charles Kingsley's burning and indignant tract on *Cheap Clothes and Nastiness*. But Maurice from first to last remained its directing spirit. The Christian Socialists began district visiting in the courts and alleys (especially Little Ormond Yard) round Lincoln's Inn, of which Maurice was preacher at this time. At stated times they met for conference in Maurice's house to discuss social problems. Ragged schools were begun under their auspices, and "sanitary leagues" when the cholera began to rage. Colonization was projected. "Let us devise a socialist home-colonization as soon as you please; provided only we give it a ground to stand upon, the sooner the better," said Mr. Maurice, in a letter to Mr. Ludlow.

A cooperative institution, which was a practical embodiment of their ideas, was started, being an association of tailors in Castle Street, nearly opposite to the place where now stands the Cooperative Institution. This was in 1849. In 1850 a society for promoting working men's associations was formed, with Maurice for its president, and became the nucleus or center of the cooperative movement. The fundamental principle of this society was "the practical application of Christianity to the purposes of trade and industry."

In December, 1849, a dinner was held at Ludlow's and a plan for cooperative stores was discussed, and for the first time the term *Christian Socialism* was agreed upon. Said F. D. Maurice, in a tract in 1850: "That is the only title

which will define our object and will commit us at once to the conflict we must engage in sooner or later with the unsocial Christians and the unchristian socialists." This position was taken largely under the influence of Ludlow, who had been in Paris and seen there the *associations*

ouvriers, and who had written to Maurice from there that "socialism must be Christianized or it would shake Christianity to its foundation, precisely because it appealed to the higher and not to the lower instincts of man." The Christian Socialists, now working under this name, started a periodical and also a cooperative store under the leadership of Walter Cooper, the ex-Chartist.

Their periodical, *The Christian Socialist*, was edited by Ludlow, but contributed to by all the members. The following, by Ludlow, clearly expresses its ideas: "A new idea has gone abroad into the world: that socialism, the latest born of the forces now at work in modern society, and Christianity, the eldest born of those forces, are in their nature not hostile, but akin to each other; or rather, that the one is but the development, the outgrowth, the manifestation of the other."

That Christianity, however feeble and torpid it may seem to many just now, is truly but as an eagle at moulting; that socialism is but its livery of the nineteenth century, which it is even now putting on, to spread ere long its wings for a broader and heavenlier flight. That socialism without Christianity, on the one hand, was lifeless as the feathers without the bird, however skilfully the stuffer may dress them up into an artificial semblance of life. That every socialist system which has maintained itself has stood upon the moral grounds of righteousness, self-sacrifice, mutual affection, and common brotherhood. . . . That Christianity, on the other hand, in this nineteenth century of ours, becomes in its turn chilly and helpless when stripped of its social influences; or, in other words, when divorced from socialism. . . . That if the Gospel speaks true, and 'ye cannot serve God and mammon,' it is wholly incompatible with a political economy which proclaims self-interest to be the very pivot of social action; . . . but that it is compatible with those theories or systems which have for a common object to bind up into fellowship, and not to divide by selfishness and rivalry; to substitute fair prices and living wages for a false cheapness, and starvation, its child; and which have adopted for their watchwords *Association and Exchange* instead of *Competition and Profit*. . . . If it be given us to vindicate for Christianity its true authority over the realms of industry and trade, for socialism its true character as the great Christian revolution of the nineteenth century, so that the title of socialist shall be only a bugbear to the idle and to the wicked, and society from the highest rank to the lowest shall avowedly regulate itself upon the principle of cooperation, and not drift rudderless upon the sea of competition, as our let-alone political economists would have it do—then, indeed, we shall have achieved our task; and no amount of obloquy, ridicule, calumny, neglect, shall make us desert it, so long as we have strength and means to carry on the fight. For a fight it is, and a long one, and a deadly one—a fight against all the armies of mammon."

The Christian Socialist was, nevertheless, less long-lived than *Politics for the People*. The movement, however, did not end. Kingsley published his *Alton Locke*. It brought down on the Christian Socialists a shower of abuse. Says Professor Seligman of it:

"Tracts full of raving and disreputable rant; mouth-pieces of class selfishness, popular prejudice and ignorant passion; ravings of blasphemy, rapine and nonsense; miserable delusions; mischievous provocations clothed in oily phrases of peace and charity; a clique of wayward-minded men who, from a morbid craving for notoriety or a crazy straining after paradox, have taken up the un-

hallowed task of preaching the doctrines of Jacobinism and the *Jaquerie*—this and much more of the like was said of them in all the reviews and journals. Advertisements were refused by the daily papers, booksellers did not dare to keep copies of their publications. *The Christian Socialist* was prohibited by the French Government from circulating in the realm. A committee of King's College was appointed to investigate Maurice's activity in these dangerous schemes, and he narrowly escaped losing at once his professorial position. Kingsley was invited to deliver a sermon in a London church, and at the close his opinions were openly branded as untrue and dangerous by the officiating rector."

Eventually Maurice was removed from his chair at King's College, and very affecting is the address of condolence presented to him by those workmen who had through him come to believe in the divine mission of Christianity in saving society. But opposition and obloquy, so far from discouraging the Christian Socialists, only acted as a spur to further exertion. "I

Opposition Encountered.

am a revolutionist," says Kingsley in one of his letters. His "Bible Radicalism" meant to go to the root of the matter, and to recover the true and original basis of Christian fellowship. At the same time they all felt that if their work was to prosper they must put their hand to the plow and give a practical demonstration of their theory. In this work the laymen of the movement were most prominent. Among these

The Cooperative Movement.

most of all Mr. E. Vansittart Neale, who, with a prodigality of self-sacrifice rarely witnessed, provided the funds for the first attempts in cooperative production, and the establishment of the central cooperative agency. In this case many of the aristocracy and clergy wished to encourage the promoters. From both orders came flowing in, and the success that was so far attained by such means induced the promoters to open an "East-End Needle-women's Workshop," and to aid the formation of an association of shoemakers. Thus in course of time a number of productive associations were formed in London and the provinces, principally in the North, especially after visits by invitation from Mr. Maurice, Mr. W. Cooper, and others, to render advice in their formation. With the further development of the movement, the need began more and more to be felt for legal protection, such as did not exist at the time. But more than legal and other advice was required, the power of the Legislature was invoked and obtained, tho not without a struggle, owing to the prejudices still pervading the House of Commons and the country. But the real boon, the "Magna Charta of Cooperation," the Industrial and Provident Partnerships Bill, did not pass till February, 1852.

The Society for Promoting Working Men's Associations received now a new constitution, the principles of which were stated to be:

1. That human society is a body consisting of many members, not a collection of warring atoms.
2. That true workmen must be fellow-workers and not rivals.
3. That a principle of justice, not of selfishness, must govern exchanges.

It will be seen from this that the principles remained the same, tho the altered condition of the law required a change in the by-laws and regulations for the conduct of business.

When the cooperative associations grew strong enough to stand on their own legs; when it was discovered that those among them which had risen up independently, and had received less or no support from the promoters—the societies for distribution—were also those which thrived the best, then it began to be felt by the main body of the promoters that their work in this direction was done. What they must do in the future, they thought, must be done by means of education. This led to the establishment of the Working Men's College, which was opened in 1854, in close vicinity of the scenes marked by the earliest successes of Christian Socialism. Henceforth the history of the Christian Socialism of England of this period was lost in the cooperative movement developing in the North of England. The London stores separate from this either failed or were swallowed by the larger movement. But the Christian Socialist thought lived. According to Maurice, the world is essentially a manifestation of God's order, but the selfishness of man has produced a deviation from the original principles. "God's order seems to me more than ever the antagonist of man's systems," he writes.

Says Professor Seligman: "These Christian Socialists were reformers in the fullest sense of the word. The kingdom of Christ was to them no empty formula; they were thoroughly imbued with the belief that this kingdom, created through

Principles of the Early Christian Socialists.

revelation, actually existed and was destined in time to subjugate all wickedness and misery. Society, according to them, is not to be made anew by arrangements, but is to be regenerated by 'finding the law and ground of its order and harmony, the only secret of its existence, in God.' In speaking of the term Christian Socialism, they denied having adopted the word Christian merely as a qualifying adjective; they maintained that Christianity has the power of regenerating whatever it comes in contact with, of making that morally healthful which apart from it must be either mischievous or inefficient." They strongly protested against the notion of turning the Bible into a book for keeping the poor in order. The Bible they considered, on the contrary, the poor man's book, the voice of God against tyrants and humbugs. "Justice from God to those whom men oppress, glory

from God to those whom men despise," was to them the thought running through the Bible.

Men of such a stamp viewed with a sovereign disdain the social doctrines of the Manchester school of political economy. They wrote: "Of all narrow, conceited, hypocritical, anarchic, and atheistic schemes of the universe, the Cobden and Bright one is exactly the worst." To the Christian Socialists a Manchester ascendancy seemed a horrible catastrophe. Said Kingsley:

"I expect nothing from a public press which panders to popular Mammonism by scraps of politico-economic cant, and justifies the ignorant miser to himself by retailing Benthamite phrases which sound like scientific laws, while they are really nothing but the assertion of barren truisms. I expect nothing from the advocates of *laissez faire*—the pedants whose glory is in the shame of society, who arrogantly talk of economics as of a science so completely perfected, so universal and all-important that common humanity and morality, reason and religion must be pool-pooed down, if they seem to interfere with its infallible conclusions, and yet revile, as absurd and utopian, the slightest attempt to apply those conclusions to any practical purpose. . . . The man who tells us that we ought to investigate Nature, simply to sit still patiently under her, and let her freeze and ruin and starve and stink us to death, is a goose, whether he calls himself a chemist or a political economist."

"Competition," said Maurice, "is put forth as the law of the universe. That is a lie. The time is come to declare that it is a lie, by word and deed. I see no way but by associating for work instead of for strikes." Kingsley maintained that not self-interest, but self-sacrifice, was the only law upon which human society could be grounded with any hope of success. "That self-interest is a law of human nature, I know well. That it ought to be the root-law of human society, I deny, unless society is to sink down again into a Roman empire and a cage of wild beasts." The enthusiasm of the promoters was unbounded. Thomas Hughes thought (and still thinks to-day) that they had found the solution of the labor question; but at that time he was also convinced that "we had nothing to do but just to announce it and found an association or two, in order to convert all England and usher in the millennium at once, so plain did the whole thing seem." And the majority of the promoters were equally sanguine.

The Christian Socialists were mistaken. Not thus are millenniums ushered in. It takes more than a cooperative association or two to make a millennium. Says William Clarke in the *Fabian Essays*:

"*The Christian Socialist*, which was the organ of Maurice and Kingsley, betrayed great simplicity as to the real nature of the economic problem. It neglected Owen's principle of 'community in land,' and supposed that by working together and selling articles of good quality at a fair price poverty could be eliminated, while yet every worker in the

Maurice's Tract

community was paying his tribute of economic rent to the owners of the instruments of production." And yet the Christian Socialism of Maurice and his coworkers was true socialism. The first of *The Tracts on Christian Socialism*, published in 1849, was written by Maurice. It commences as follows:

A Dialogue between Somebody (a person of respectability) and Nobody (the writer).

Somebody. CHRISTIAN SOCIALISM! I never saw that adjective united to that substantive before. Do you seriously believe that a socialist can be a Christian, or a Christian a socialist?

Nobody. I seriously believe that Christianity is the only foundation of socialism, and that a true socialism is the necessary result of a sound Christianity.

S. Sound and true! One understands those words very well. True socialism is your socialism, not that of Owen, Fourier, Louis Blanc, or any other Englishman, Frenchman, German. Sound Christianity is your Christianity, not that of any church, -sect, school, or divine hitherto known in Christendom.

N. The socialism I speak of is that of Owen, Fourier, Louis Blanc, and of the Englishmen, Frenchmen, Germans, who have fraternized with them or produced systems of their own.

S. A sufficient warrant for the other half of my proposition. Your Christianity then, I presume, is that of Owen, Louis Blanc, Fourier? A rather peculiar species of a very comprehensive genus! But to waive that point for the present. Your socialism is

that of a hundred different men at strife with each other.

N. All these men, if I understand them rightly, are attempting to compass the same end. They differ about the means of compassing it.

S. The same end? Happiness, I suppose. Socialists and anti-socialists are probably agreed so far.

N. The watchword of the socialist is COOPERATION; the watchword of the anti-socialist is COMPETITION. Any one who recognizes the principle of cooperation as a stronger and truer principle than that of competition has a right to the honor or the disgrace of being called a socialist.

N. further says in the tract: "I grant you that a Christianity which is merely brought in to help out the weakness of a system formed in the eighteenth or nineteenth century will be a very poor, weak Christianity indeed. I do not believe that these French reformers, if they are as honest as I hope some of them are, can ever be content with such a feeble and paltry creation. They want a ground to stand upon, not a Corinthian capital, to make their edifice look more stately and graceful. And if they begin to look earnestly at the Bible history, at the creeds of the Christian Church, at the records of it from the Day of Pentecost to this time, I believe they will find more and more that they have the ground there, the only one upon which they can stand or work. They will not read in the Divine Book of a great strife of individual competitors, but of a Divine family, expending itself into a Divine nation, of a universal society growing out of that nation, recognizing and preserving both the forms of human fellowship out of which it was unfolded."

After this wave of Christian Socialism in England, we have a long gap in the movement. Socialism of all kinds seemed dead in England. But the thought was not dead. Early in the seventies the Rev. Stewart D.

Headlam founded and has ever since been warden of the *Guild of St. Matthew*.

English Chris-Altho a so-called High Church organization, it has become the leader of the remarkable movement among the younger Catholic wing of the Church of England toward radical socialism.

To-Day.

It believes the secular to be spiritual, and finds secular principles involved in the highest Church teachings. Since 1882 Mr. Headlam has also edited the *Church Reformer*, the organ of the guild, and an outspoken mouthpiece of Christian Socialism (see ANGLICAN POSITION IN SOCIAL REFORM). Its radical nature can be seen in its reference to the Queen's Jubilee celebration as that "blasphemous" adulation going on at Westminster Abbey; and by the ultra-socialistic literature advertised and commended in its columns. The Guild of St. Matthew has a small but enthusiastic following through all England. In or near London alone some 50 clergymen belong to it, among them the Rev. C. L. Marson (*q.v.*), the Rev. Percy Dearmer (*q.v.*), the Rev. W. E. Moll, of St. Mary's, Soho, the Rev. H. C. Shuttleworth, and the Rev. T. Hancock, author of sermons widely circulated in England, such as the one entitled *The Banner of Christ in the Hands of the Socialists*.

Of much more recent date and not so radical in its socialism, and yet doing a very wide and important work in the Church of England, is the Christian Social Union, founded in Oxford in 1880, under the lead of the Bishop of Durham and Canon Scott Holland. (For a fuller account of it, see CHURCH SOCIAL UNION.) While it does not declare explicitly for Christian Socialism, its principles and teachings so largely tend this way that they are commonly spoken of in England as "The New Christian Socialism." It is significant, therefore, that the Union embraces so many of the leading members of the Church of England, is the publisher of the able *Economic Review*, and includes men of such power and spirituality as the Rev. Charles Gore, Dean Stubbs, and others, including its secretary, the Rev. John Carter. In East London, the Rev. James A. Adderley (*q.v.*) has founded a brotherhood and publishes *Good Will*, a magazine of Christian Socialism adapted to use in parishes, with a circulation of about 24,000. Outside of the Church of England too there is much Christian Socialism. A Society of Christian Socialists organized early in the eighties, not confined to the Church of England, and which from 1883 to December, 1891, published an organ, *The Christian Socialist*, no longer exists, but its work is carried on by *The Christian Socialist League*, of which the Rev. Dr. John Clifford, a leading Congregational clergyman, is president, and J. Bruce Wallace, Percy Alden, E. D. Girdlestone, John H. Belcher, and Professor Shuttleworth are prominent members. Among

the Wesleyans the Revs. Hugh Price Hughes and Mark Guy Pearse are outspoken for Christian Socialism, while in Scotland the Rev. John Glasse, of the Church of Old Greyfriars, is a pioneer of socialism in Scotland.

Apart from all Church organizations, yet standing for a very vital Christian Socialism, are the labor churches (*q.v.*) begun in England by John Trevor (*q.v.*) in 1891. (For a full account, see LABOR CHURCHES.) They represent a strong radical movement politically in connection with the Independent Labor Party, yet insisting on the religious character of the labor movement. Some two dozen labor churches exist in England, with beginnings of a dozen or more. In London, J. Bruce Wallace is pastor of the Brotherhood Church and founder of the Brotherhood Trust (*q.v.*) Altogether no one can deny that Christian Socialism in one form or another is a very vital part of English social reform.

GERMANY.

Christian Socialism in Germany dates in its present form from the period of the Lassalle agitation, yet had its precursors in the philosophy of Fichte and Hegel and the communistic preaching of Albrecht the Prophet and of Weitling (*q.v.*). We consider its Roman Catholic and Protestant developments separately.

The Roman Catholic movement came first. Early in this century Franz Xavier von Baader (*q.v.*), moved by the sorrows of the working class, recommended a "theocracy," a monarchy guided by Divine politics, as opposed to a democracy of revolution, a State held together by Christian love, equally free from slavish despotism and lawless individualism. "The Church," he said, "must strive for this. It must provide a new diacnate to bring about a more equitable redistribution."

A greater German Roman Catholic Christian Socialist was Wilhelm von Ketteler (*q.v.*), the late Bishop of Mayence. Von Ketteler was in very many ways like Kingsley. He said of himself: "I have lived with and among the people, and know them in their sorrows and complaints. There are few of the tears and none of the sufferings among the people committed to my charge which have escaped my notice." He had especially endeared himself to his people by his bravery and devotion during an epidemic of typhus fever in 1847. He was elected to represent his district in the Germanic Confederation at Frankfurt. As early as 1848 he preached a course of sermons on the social subject in the cathedral at Mayence to audiences of many thousands. He largely indorsed the socialistic program of the day, invoking State protection against the encroachments of irresponsible capitalists; but he held that to endure, society must be founded on the rock of St. Peter. He pointed out the impotence of legislation to equalize property. Christianity alone, he taught, could put cooperative associations on a sound basis. "May God in His goodness," he cried, "bring all good Catholics to adopt this idea of cooperative associations of production upon the basis of Christianity." Yet little directly resulted.

In 1864, however, Ketteler published a treatise, *The Labor Question and Christianity*, and in 1868 organization was reached in the Christian Social Working Man's Associations. An organ of the movement was started, *Die Christliche Soziale Blaetter*. In 1870 the Catholic Journeymen's Clubs, which had been started in 1847 by Father Kolping, a pious artisan, joined the Christian Socialist movement. These clubs numbered, in 1872, 70,000 persons, mainly in Bavaria and Westphalia. They were strictly under the control of the Church, and therefore were more or less opposed by the Social Democrats. Yet the movement grew. In 1873 it numbered 12,000 in Westphalia alone. It took many forms—benefit associations, savings and credit associations, associations for diffusing literature, working girls' associations, etc. The movement is represented by several papers. At the meeting in 1871 Canon Moufang, in a memorable speech, presented the points which have become the program of the movement: (1) Legislative protection of the rights of labor; (2) pecuniary State subvention in aid of cooperative associations; (3) reduction of the burdens of taxation and military service; (4) restriction of the power of capital, and the removal of evils arising from usury and over-speculation. At the conferences of German Ro-

German
Catholic
Christian
Socialism.

man Catholic societies at Breslau, in 1872; Aachen, 1873; Mainz, 1874; Schlesien, 1877, and especially at Düsseldorf in 1883 and Trier in 1887, the social question was very prominent. Gradually two wings have developed: one tending to individualistic methods of reform and "self-help," etc.; the other calling for State action and much of the socialist program. At Trier and Düsseldorf especially the latter wing showed itself in the majority. The rapid growth of the Social Democratic Party in Germany has, however, made it very difficult for the Catholic Socialists to maintain their hold on the working man. Nevertheless in 1882 they had 110 representatives in the Reichstag, and in 1891 they counted 820 unions with 75,000 members.

In fact, the main strength of Catholic Socialism lies in this widely spread system of organization. In places the number of associations of operatives under Church auspices surpasses the aggregate amount of all other similar associations taken together. There are Catholic associations of masters and apprentices, of factory laborers, miners, and vintners; there are "Patriotic Bavarian" and Westphalian unions of peasant proprietors, and a number of other societies of men and women in every direction, exercising a powerful influence under strict clerical supervision, the result of which is that in purely Catholic regions for any efforts of social reform to be successful, it is essential in the first instance to secure the Catholic ecclesiastics as auxiliaries in any such undertaking.

The movement has thus enabled the Roman Church to bring into the field a strong force of artisans in the battle of the *culturkampf*, developing at times a strange political union between the Radical and Church Socialists in the struggle against the Bourgeoisie, and fulfilling the prediction of Cavour of a union between Romanism and Socialism, between the red and the black International, between Ketteler's "Kosacken regiment," as it has been contemptuously called, and the followers of Lassalle and Karl Marx. This union, however, it must be remembered, is only political, and only exists at times and for particular ends. The Social Democrats of Germany, as elsewhere in Europe, are opposed to all churches (see ROMAN CATHOLIC CHURCH AND SOCIAL REFORM).

Protestant Christian Socialism in Germany has been a wholly separate movement. As early as 1838 Victor

German Protestant Christian Socialism.

Aimé Huber (*q. v.*), who may be called the founder of German Christian Socialism, at the request of Friedrich Wilhelm IV. of Prussia commenced in Berlin a paper, the *Janus*, advocating religious cooperation. After the revolution in 1848 this was discontinued, but Huber formed an Association of Christian Order and Liberty. It was not successful, altho Huber himself seems to have been a man of sound judgment and full of beneficent plans. "The father of vagabonds" he called himself, and in a little town among the Hartz Mountains he established a home among the poor, going out thence on journeys through Germany, France, and England, urging cooperation in agriculture and in all forms of life. He died July 19, 1869.

About 1878, however, commences the chief movement of Protestant Christian Socialism in Germany, begun by Pastor Todt and brilliantly championed by Stöcker, the court chaplain. From the first it allied itself to the paternal State socialism, which has become the policy of the Prussian monarchs.

Kaufmann, in his *Christian Socialism*, says of this German Protestant Christian Socialism: "This title is somewhat misleading, since those to whom it is applied, and who cheerfully accept the appellation, are so far from being socialists, in the ordinary sense of the word, that the name 'Defenders of Society on Church and State Principles' would convey a more correct idea of their aims and purposes to English readers. Properly speaking, they are conservative would-be saviors of society, who see no other means of escape from the present social dilemma but in a firm alliance between crown and altar for the purpose of regenerating society."

An association was formed and soon gained adherents in "Christian circles." It called itself the Central Union for Social Reform on a Religious, Constitutional, Monarchical Basis. It sent forth an appeal to the clergy, reminding them that the hour had come for the Church to bestir itself to meet the social crisis with the spiritual weapons at its command, as an evangelical body. Two fundamental principles are laid down in the program, one indicating the duties of the State, the other those of the Church:

1. That thorough reforms have become necessary in

order to inspire the enfranchised masses with confidence toward the Government.

2. That the solution of the social question is impossible without the cooperation of the moral and religious factors, and the Church's recognition of the just demands of the fourth estate (the working men).

Among the objects of the association are mentioned the diffusion of a wholesome literature for the purpose of stemming the tide of materialistic and revolutionary modes of thought and feeling among the masses; the publication of a paper, the *Staats Socialist*, for the exposition of free discussion of burning questions in political economy; the collection and organization of the scattered loyal elements among the people as the best available means of defense against the anarchical attempts of social democracy; and the full expression both in word and deed of sympathy with the rightful demands of the working classes, to assure them of the support of the "main pillars" of society, the Church and the State.

Eventually, Todt and Stöcker founded two associations: first of all, the Central Union for Social Reform, and then the Christian Social Working Men's Party. Altho the same ideas and nearly the same persons had directed the formation of the two groups, their aims were very different. The Union for Social Reform was to be composed of well-to-do and educated men, such as ministers of the Church, professors, manufacturers, and land-owners, who would join in seeking for means of conciliating the anarchic classes through reforms inspired by the spirit of Christianity. The Christian Social Working Men's Party was to rally and to aid working men.

The movement met great opposition. All the progressive papers protested against it as *mucker-socialism*, or sham socialism. The liberal press also opposed it. "We prefer," said one paper, "socialists in blouse to socialists in surplice."

The higher dignitaries of the Evangelical Church held aloof from the movement, or indeed were hostile to it; but the common clergy were stirred. More than 700 ministers sent in their adhesion to the Central Union for Social Reform. Dr. Kögel, one of the court preachers, Dr. Büchsel, the superintendent-general, and Dr. Bauer strongly urged the Protestant clergy to take up the social question. Dr. Stöcker displayed wonderful courage. He attended public meetings at Berlin, where he confronted the most fanatical opposition of the Socialist Democrats, and sometimes, by sheer force of eloquence, he won cheers from the hostile crowd. He was attacked with extraordinary violence by Herr Most, who organized what he called a *Massenaustritt aus der Kirche*, or formal renunciation of the Church.

The Central Union for Social Reform also obtained the adhesion and even the cooperation of several well-known economists, such as Professor Adolf Wagner, of Berlin University; Dr. Schaeffle, former Minister of Finance in Austria, and author of *Socialismus und Capitalismus*; Herr Adolf Samter, banker at Königsberg; and Professor von Scheel. But in order to influence the masses, as the Catholic Socialists have done, the assistance of the clergy was needed; and it was to gain this assistance that the founders of the movement, Stöcker and Todt, directed all their efforts. According to them, the duty of ecclesiastics, and even of the Protestant Church as a body, was to take part in discussions on the social question. This question, they said, embraces the whole of humanity. The Social Democracy rests on materialism and propagates atheism, while liberalism and so-called positive science, by endeavoring to eradicate the religious sentiment, supply it with weapons. Who is to defend this precious treasure, if not the pastor? Christ came to bring the "glad tidings" to the poor; His disciples and apostles ought to do likewise. They ought to search out the causes of the ills of the lower classes, in order to find the remedy. Political economy can alone throw light upon these difficult questions, and it must accordingly be sedulously studied. The clergy ought unceasingly to remind the State and the upper classes of the duty imposed upon them by the law of the Gospel in respect of their destitute brethren. The passion for accumulating riches is becoming more and more the characteristic of our age. This "Mammonism" is the enemy of Christianity, and must be unwearyingly combated.

Pastor Todt is the chief author of the movement, his book, *Radical German Socialism and Christian Society*, having a large reading and much influence. In this work Todt condemns the economics of liberalism as unchristian, and seeks to show that the ideals of liberty, equality, and fraternity are scriptural, as are also the socialist demands for the abolition of private

property and of the wage system, the laborer to have the full produce of his labor, and labor to be associated. Herr Todt places the following epigraph at the head of his work: "Whoever would understand the social question and contribute to its solution must have on his right hand the works on political economy, and on his left the literature of scientific socialism, and must keep the New Testament open before him." Political economy, he adds, plays the part of anatomy: it makes known the construction of the social body. Socialism is the pathology which describes the malady, and the Gospel is the therapeutics which apply the remedy.

Is it not remarkable that the Christian countries are precisely those which have evolved socialism? What is the reason of this? According to Herr Todt, it is because socialism has its root in Christianity: only it has gone astray from it. It is the fruit of the Gospel, but it has become corrupt. In reality, according to Herr Todt, socialism springs from the sentiment of revolt, produced by the sight of the contrast between the existing economical constitution of society and a certain ideal of justice and equality. Hence arises the desire to remove this contrast by a radical reform of the social order. Christianity also condems the present world, where selfishness and evil passions prevail, and announces the "new kingdom," where the first shall be last, where charity shall make all men brothers, and where the earth shall belong to the peaceful and lowly.

Present Development.

Adolph Wagner, the learned Professor of Political Economy in the University of Berlin, is from the standpoint of science even a greater influence in this movement. More recently the two branches of the movement have become one under the name of *The Central Association for Christian Social Reform*, and is doing a very wide work. Its adherents are said to number over 7000, mainly in Berlin. The movement has, however, largely changed its character. Herr Stöcker early became a leader in the anti-Semitic movement, and by so doing attached to himself a certain political following not always of a desirable character, and, at the same time, prejudiced against him many who had been attracted by his Christian Socialism. The movement, therefore, so far as it is Christian Socialist, has broken away from his lead, and for the most part has become a movement for all kinds of church and social philanthropic societies and efforts. It has in this line developed a large and useful activity. It has, however, become so connected in this movement with the so-called "Inner Mission" (*q.v.*) in Germany that we consider it best under that head. Only a few of the younger men adhere to any large extent to the radical views with which Christian Socialism in England and America is usually identified. Nevertheless, important yearly congresses of the *Evangelische Sozialisten*, as they are called, are held, and led by such men as Paul Göhre, for a long time the secretary of the association, exert no small influence in the Protestant Churches of Germany. (See INNER MISSION.)

FRANCE.

France may be said, in a very real sense, to be the birthplace of Christian Socialism. As long ago as 1790 did Claude Fauchet (*q.v.*), once a court preacher, and then a leader in the Revolution, advocate a radical Christian communism, and founded a Christian communist paper—

Early Christian Socialists.

the first socialist paper of the world, *Bouche de Fer (The Iron World)*. He founded Christian socialist clubs, and exerted no little influence. The *bon mot* of Camille Desmoulin, calling Christ *le bon sans-culotte*, is well known. Saint Simon (*q.v.*) himself has been sometimes called the first Christian Socialist. His first idea was to induce the Pope to found a new Christian social order, and when he failed in this, he undertook himself to found what he called a New Christianity. Several of the Saint Simonians, notably Buchez (*q.v.*), believed that they could, and endeavored strenuously to establish a new social Christianity. Far more truly may Lamennais (*q.v.*) be considered a leading French Christian Socialist. His journal, *L'Avenir*, began in 1830 with its motto, "God

and liberty, the Pope and the people," and after his break with the papacy, his *Les Paroles d'un Croyant (The Words of a Believer, 1839)*, are among the noblest and most burning Christian socialist utterances ever made. Cabet, the brilliant author of the utopian *Icaria*, must also be mentioned here, with his book, *Le Vrai Christianisme suivant Jesus Christ (1846)*, striving to show that Christianity is communism. Yet in spite of these and other brilliant utterances there has been no organized Christian socialist movement in France until very recent times.

Says Kaufmann, in his *Christian Socialism*, p. 169: "De Maistre, Lamennais, Lacordaire, on the one hand, Bonald, Le Play, and le Comte de Mun, on the other, represent in the order we have placed them, tho not in chronological sequence, the ascending and descending scale from and to the Ultramontane standpoint of Christian Socialism."

The great movement of Le Play (*q.v.*) can, in itself, however, scarcely be called a Christian Socialist movement, altho it has led to some extent to a movement sometimes using this name. Le Play himself, altho a devout Roman Catholic, aimed to make his movement purely educational. The founder of the real Roman Catholic socialist movement in France is the Comte de Mun (*q.v.*). He, with the Comte de la Tour-du-Pin Chambly, founded, soon after the Franco-Prussian War, the *Œuvre des Cercles Catholiques d'Ouvriers*, an association organized for the purpose of bringing together working men on a Church basis, and standing on the social principles of the encyclical and syllabus of 1864. Its professed object is "the counter-revolution, made in the name of the syllabus, and the great work of reestablishing a Christian order in the world of labor." The followers of this school hold the Protestant Reformation to be the parent of all France's moral and social ills. They see in the Reformation a revolution against God, the worship of the sovereignty of the man in place of the sovereignty of God. They class Luther, Calvin, Voltaire, Rousseau, Danton, Robespierre, side by side. Against the Reformation, with its asserted ecclesiastical, political, social, and moral results, they declare war. In place of Protestantism and economic individualism they would establish cooperative association with State aid, under the patronage of the Church of Rome. With the Social Democrats they have nothing to do. Since the Pope has condemned socialism under that name, though indorsing many of its principles, they deny that there can be a Christian Socialism. The movement is more ecclesiastical and political than really Christian Socialist. It is an effort to hold the working classes for Rome. The direction of the unions is placed in the hands of local committees in close connection with a central committee in Paris. It is an attempt, moreover, of bringing together the higher and lower classes of society by means of Christian sympathy, and so to effect social union. These Catholic working men's associations combine the advantages of a religious club, a cooperative supply association, and a laborer's friend society all in one. Eventually the *Œuvre* purposes to become the nucleus of a number of benevolent institutions to promote the welfare of the working man. Originally intended for the workmen of large towns, these associations have spread into the villages, and are now what the Comte de Mun calls calmly settled "islets in the midst of immense populations agitated by the tempests of social war." There were 450 of these *cercles* in 1880, and several employers of labor, like the Christian philanthropist Harmel in the Val-des-Bois, are able to give most satisfactory reports of their own attempts to transform unruly colonies of workmen into quiet and industrious communities by the adoption of the principles of the *cercles*, and thus to establish a happy relationship between employer and employed.

In 1887 there were 400 *cercles* and 130 cooperative associations.

His leader, the Comte de Mun, is an active politician and fluent speaker, and tho sometimes defeated, has frequently been elected to the Chamber of Deputies, where he is the leader of his party.

This movement, however, is not the only Roman Catholic social movement in France. In 1890 Bishop

French Christian Socialism.

Frippel founded *La Société Catholique d'économie politique*, representing the Le Play movement, but in direct conjunction with the Church. To the Le Play school also belong Claude Janvel, Charles Perin (*q. v.*), the Jesuit fathers Forbes and Caudron, and other prominent Catholic workers for social reform. (See LE PLAY; and ROMAN CATHOLIC CHURCH AND SOCIAL REFORM.)

Protestant Christian Socialism in France is still more recent. Our account is abridged from an article by Rev. John G. Brooks in *The New World*, December, 1892:

"In 1887 Pastor L. Gouth of Aubenas (Ardèche), after much conversation and correspondence with Pastor I. Fallot and other laymen, took the initiative in the establishment of a Protestant Association for the Practical Study of Social Questions.

A provisional committee was named, and requests for membership were sent out to every department, and on October 18 and 19, 1888, the association held its first general assembly at Nîmes (Gard). In this assembly there met members of the different Protestant churches of France, especially the clergy. The fact which caused the most astonishment and rejoicing was that orthodox and liberals of the national Church forgot their divisions and joined hands on common ground, after 15 years of theological and ecclesiastical controversy. All were there animated by the same spirit, and all sought the same end. If this end was not very clearly seen—the greater part of the members having given very little study to the complex social question, or social questions rather—all felt that there was something for Christians to do, and that it was a duty for all to labor in concert to establish the kingdom of righteousness in the world. After a noble discourse by the president, the courageous Pastor I. Fallot, and an incisive and thoughtful report by M. Charles Gide, the eminent professor of political economy, rules and regulations were voted, of which these are the principal articles: 1. A Protestant Association for the Practical Study of Social Questions in France is hereby established. 2. It appeals without distinction of opinion to all Protestants, men and women, who comprehend their responsibilities and their duties in view of the sufferings and the dangers of existing society, and who are resolved to thoroughly apply to the organization of society, as well as to the life of the individual, the principles of justice and love proclaimed by Jesus Christ. 3. It proposes to aid its members in the study of economic science and of the various efforts at social reform. 4. Placing itself above all on moral and religious ground, the association will apply itself to the investigation and publication of everything in the existing order which is contrary to justice and solidarity, everything of a nature to hinder the moral and religious development of the individual, and consequently his salvation. 5. The aim of the association is to labor to repair the evils from which we suffer, by pointing out to Christians their social duties, by suggesting to them the initiative in works of brotherhood and relief, and by acting upon public opinion and the established powers to bring about necessary reforms."

"Many general assemblies have since been held—at Nîmes, Lyons, Montbeliard (Doubs), Marseilles, Havre, and Paris. The association has now a membership of some 600, and has striven mainly to encourage social studies, both theoretical and practical, chiefly through means of conferences; to undertake or encourage the publication of these social studies in pamphlet form or in periodicals; to establish in Protestant communities groups for social study and social activity. Several of the members have established in their churches, or rather in their communes, institutions answering to its aims, a bureau of information and employment, a *Maison de Travail*, a mutual aid society; elsewhere a society for the aid of young apprentices of both sexes, lodging-houses, and the like institutions. The *Review of Practical Christianity*, published once in two months, at Vals-les-Bains (Ardèche), at the price of five francs, is the official organ of the association. Edited by M. Chastand, pastor at Vals, this review publishes papers from the historical, the theoretical, and the practical points of view, by MM. Gide, de Boyve, Fallot, Robin, König, Raoul Allier, and many others of the laity and clergy. M. de Boyve edits *L'Emancipation*, published at Nîmes (Gard).

"The association during the Paris Exposition was represented at the congress on participation in profits, at the congress held to consider accidents to working people, and at the congress on Sabbath rest. The fine

work of Pastor Wagner, *La Jeunesse*, has been crowned by the Academy. It has lately been translated into English and issued in England and America. Efforts of many kinds are made, especially in what concerns the elevation of woman—a work pursued with steadfastness by MM. Fallot, Charles Secrétan, Minault, Gouth, Comte, and several others."

OTHER EUROPEAN COUNTRIES.

Belgium has distinguished herself in the literature of Christian Socialism. Colins, born in Belgium in 1753, should perhaps be mentioned here, tho he wrote mainly in Paris, and developed a philosophy in most respects anything but Christian, since he believed, strangely to say, in immortality, but not in God. As an ardent land nationalizer, however, and with a religious spirit, altho a bizarre theology, he perhaps sowed seeds which have sprung up in Belgian Christian Socialism. Huet (*q. v.*), born in 1814, was an out-and-out Christian Socialist. His *Le Règne Social du Christianisme*, published about 1850, is one of the earliest and best statements of Christian Socialism in any language. Professor de Laveleye was his pupil, and says of this book that it has not received the attention it deserves, being too full of Christianity for most socialists and too full of socialism for most Christians. A Roman Catholic of the school of Pascal and Bossuet, he protested to the last against ultramontanism, and for a liberal Catholicism and a spiritual secularity. Professor Emile Louis de Laveleye, his most distinguished scholar, belongs to the same school. Professor of Political Economy at Liege, he is as well known for his Christian Socialism as for his economic and sociological writings. A Catholic, altho of the extreme liberal type, his position on Christian Socialism may be summed up in the passage from the introduction to his *Contemporary Socialism*, where he says: "Every Christian who understands and earnestly accepts the teachings of his Master is at heart a socialist; and every socialist, whatever may be his hatred against all religion, bears within himself an unconscious Christianity." Professor C. Perin, of the Roman Catholic University of Louvain, belongs to the ultramontane school. His treatise on *Wealth in Christian Society* was published in 1861. Later he published a work on the *Laus of Christian Society*, which was prefaced by a pontifical breve, dated 1875. In 1879 he published a work on *Christian Socialism*, to which was added an address he delivered at the opening of the Congress of the Directors of the Roman Catholic Workman's Associations, at Chartres, August 9, 1878. Perin founds social order on Divine authority, but trusts largely to the moral rather than the dogmatic influence of the Church. Industry, he believes, should be organized, both paternally and fraternally, under employers, and yet with a Christian fraternal spirit. (For further details, see COLINS; HUET; LAVELEYE; PERIN.) With all these and other Christian Socialist writers in Belgium, one is not surprised to find much fruit. Roman Catholic Workman's Associations have existed in Belgium some 25 years. Altho in many ways not popular organizations among the masses, since they are very largely managed and controlled by priests and Jesuits, they do reach many workmen, and their frequent congresses have been very influential. On the occasion of the congress at Liege in 1886, Pope Leo XIII. addressed a favorable letter to the Bishop of Liege, which was enthusiastically received. The International Catholic Congress at Liege in 1887, under the presidency of the Cardinal Archbishop of Rheims, and attended by prelates from all over Europe as well as by Belgian members of Parliament and employers of labor, gave large attention to social questions, and took position largely on the lines advocated by Professor Perin. At the congress at Liege in 1890 there were 1500 delegates, including 10 bishops. The Catholic movement, however, in Belgium has two schools, one of which would oppose Catholicism to the socialist movement, and try and defeat it; the other would work with the socialists so far as possible, and try and Christianize their movement. Both parties, however, are opposed to radical democratic socialism, and are, therefore, violently opposed by the Belgian socialists, who would away with pope and bishop, as well as capitalist and king.

In other European countries Christian Socialism has a less hold. In Geneva, in Switzerland, however, there are two societies of Christian Socialists, and these extend their influence very largely through all Switzerland. One of these, the Christian Swiss Society of Social Economics, is mainly an educational society,

Belgium.

French Protestant Christian Socialism.

working among the educated classes. Its president is M. Frédéric Necker, a descendant of Madame de Staël.

Other Countries.

It numbers among its members many of the prominent Swiss Protestant clergymen, but has also many professors, business men, and bankers. The venerable and well-known Professor Charles Secretan, of Lausanne, was among its directors and a firm Christian Socialist in the larger sense of the term. The other society, the Society for the Practical Study of Social Questions, works among the working classes, and attempts to come into contact with the non-Christian Swiss socialists. It is under the lead of the Geneva pastor, M. H. Koerich, and is mainly useful in publishing some admirable altho radical Christian Socialist literature. It publishes a monthly paper, *La Solidarité*, at Imprimerie Dubois, Quai des Moulons, Geneva; price, for foreign countries, 75 cents. Roman Catholic Christian Socialism in Switzerland has little development, altho not a few of the priests, notably one at Chur, speak openly on this question, following the recent lead of the Pope (see THE CHURCH AND SOCIAL REFORM; ROMAN CATHOLIC CHURCH). In Austria Christian Socialism was first advocated by a Protestant, Rudolph Meyer, but he was effectively seconded by Roman Catholics—Prince von Leichtenstein, Counts Blome and Kuefstein, and most of all by Baron von Vogelsang, the founder of the organized movement. Austrian Christian Socialism is, however, little more than patronage of working men in the interests of Rome. Other countries have done still less, altho Rev. M. Kaufmann (*q. v.*), in his *Christian Socialism*, says: "As the eye travels over the map, different countries at once call up before the mind figures of prominent Christian Socialists in every direction. The Scandinavian North suggests the venerable figure of the late Bishop of Zealand, and his work on *Socialism and Christianity as a Fragment of Christian Ethics*. Italy reminds us of the social studies of Rafeale Mariano in his work on *Christian Catholicism and Culture*. To this in Italy should be added the great name of Mazzini (*q. v.*), who, tho neither a Christian nor a socialist, as they were presented to him in his days, was one of the truest Christian Socialists of the century, as witnessed to by his *Duties of Man* and other writings. (See MAZZINI.)

THE UNITED STATES.

Christian Socialism in America has made a more recent appearance. This is due undoubtedly mainly to economic conditions in part to the American idea of the divorce of Church and State, which has meant too often the divorce of secular and religious life. There have long been those, however, in America who have individually looked this way. Many of the participants in the Brook Farm and the early Fourier experiments acted on motives largely those of Christian Socialism. As early as 1849 Henry James, Sr., in a lecture delivered in Boston, argued the identity of Christianity and Socialism. In 1872 a Christian Labor Union was organized in Boston under the lead of George E. McMill, Edward H. Rogers, Hon. T. Wharton Collins (of New Orleans), the Rev. Jesse H. Jones, Henry T. Delano, and others. The Rev. Jesse H. Jones from 1874-75 published a paper in Boston called the *Equity*, really a paper of Christian Socialism. The writings of the Rev. R. Heber Newton, D.D., of Drs. Lyman Abbott, Rylance, Washington Gladden, Professor R. T. Ely, are well known. Yet were there no Christian Socialists, so-called, in America till organization was effected in Boston, April 15, 1889, largely under the lead of the Rev. W. D. P. Bliss. It was called the Society of Christian Socialists, and adopted the following principles:

"To exalt the principle that all rights and powers are gifts of God, not for the receiver's use only, but for the benefit of all; to magnify the oneness of the human family, and to lift mankind to the highest plane of privilege, we band ourselves together under the name of Christian Socialists.

"I. We hold that God is the source and guide of all human progress, and we believe that all social, political, and industrial relations should be based on the fatherhood of God and the brotherhood of man, in the spirit and according to the teachings of Jesus Christ.

"II. We hold that the present commercial and industrial system is not thus based, but rests rather on economic individualism, the results of which are:

(1) That the natural resources of the earth and the mechanical inventions of man are made to accrue disproportionately to the advantage of the few instead of the many. (2) That production is without general plan, and commercial and industrial crises are thereby precipitated. (3) That the control of business is rapidly concentrating in the hands of a dangerous plutocracy, and the destinies of the masses of wage-earners are becoming increasingly dependent on the will and resources of a narrowing number of wage-payers. (4) That thus large occasion is given for the moral evils of mammonism, recklessness, overcrowding, intemperance, prostitution, crime.

"III. We hold that united Christianity must protest against a system so based and productive of such results, and must demand a reconstructed social order, which, adopting some method of production and distribution that starts from organized society as a body and seeks to benefit society equitably in every one of its members, shall be based on the Christian principle that 'We are members one of another.'

"IV. While recognizing the present dangerous tendency of business toward combinations and trusts, we yet believe that the economic circumstances which call them into being will necessarily result in the development of such a social order, which, with the equally necessary development of individual character, will be at once true socialism and true Christianity.

"V. Our objects, therefore, as Christian Socialists, are:

(1) To show that the aim of socialism is embraced in the aim of Christianity. (2) To awaken members of Christian churches to the fact that the teachings of Jesus Christ lead directly to some specific form or forms of socialism; that, therefore, the Church has a definite duty upon this matter, and must, in simple obedience to Christ, apply itself to the realization of the social principles of Christianity.

"VI. We invite all who can subscribe to this declaration to active cooperation with us, and we urge the formation of similar fellowships in other places throughout the land."

This society included members of all churches. Its president was a Baptist, the Rev. O. P. Gifford, and among its officers Rev. P. W. Sprague (Episcopalian) and Mrs. Mary A. Livermore (Universalist). Branch societies were also started in many cities. The society also established, in 1889, a monthly organ, *The Dawn*, for some years published in Boston by Mr. Bliss. The society, however, no longer exists. Mr. Bliss has established an Episcopal mission, the Church of the Carpenter, in Boston, which supports the name and principles of Christian socialism, but through the country the organization has not taken root. This is, perhaps, however, somewhat due to the fact that Christian Socialism has in one form or another very largely entered the churches themselves. *The Dawn* in January, 1893, published a list of some 700 clergymen more or less actually engaged in Christian Social reform. In the Episcopal Church, a Church Social Union (*q. v.*) has been established that has reached 1000 members. In the Baptist Church a Brotherhood of the Kingdom (*q. v.*) has been formed. Still larger and more influential is the American Institute of Christian Sociology (*q. v.*), which is not confined to any one denomination. In many colleges and divinity schools there are now either chairs or courses of lectures in Christian Sociology. Especially active in this work has been the Rev. G. D. Herron, D.D., Professor of Christian Sociology at Iowa College, Grinnell, Ia. Professor Herron is author of many small but brilliant books, and is constantly lecturing or holding institutes of Christian Sociology in all sections of the country. The Rev. Graham Taylor, Professor of Christian Sociology in Chicago Theological Seminary, is also working, tho more conservatively, on Christian social lines. *The Kingdom*, a monthly of applied Christianity, published in Minneapolis, has reached a circulation of some 20,000. Almost all Church papers in the United States, notably *The Outlook* (see ABBOTT) and *The*

Christian Statesman, published in Alleghany, Pa., are full of earnest articles on Christian social reform. Much of this movement, however, is not committed to the definite principles of Christian Socialism, nor to the radical measures (advocated in *The Dawn*) in this country and among most English Christian socialists.

Views of Dr. G. D. Herron.

The emphasis of Dr. Herron's teaching, e.g., is upon the coming of the kingdom of God and the enthronement of Christ as king over all social life. Says a reviewer of Dr. Herron's work: "His spirit is one of intense loyalty to Jesus Christ, demanding His immediate enthronement in those spheres of action in which most Christians and the world have denied Him sovereignty. There are no books that breathe a stronger personal attachment to a risen living Lord than his. His basal principle is the Cross—self-sacrifice as the law for Church and society, State, nation, and world, as well as for individual life. And this he iterates and reiterates with an intensity and passionate eagerness, a particularity and a wideness of scope that no man in history has attempted (so far as I know) this side of Paul. 'In the class room from day to day, as well as in the pulpit on Sundays, he seems determined to know nothing but Jesus Christ and Him crucified.'"

Dr. Herron steadily declines to go into detailed schemes for the reconstruction of society. He believes it to be the function of Christian sociology not to enter such details, but to present the general principles according to which a true society must be constructed. Without fear or favor, however, Dr. Herron condemns the present industrial, social, and ecclesiastical conditions, and demands their reformation in the name of Christ.

Radical Christian Socialism.

On the other hand, the Christian Socialism advocated by *The Dawn* and a few of the more radical Christian Socialists of the country does advocate the definite measures of the socialist program, yet ever in the name of and based upon the life and teachings of Jesus Christ. Says a tract by the Rev. W. D. P. Bliss:

"Christian Socialism is the application to society of the way of Christ. It believes that Christ has a social way, and that only in this way are there healing and wholeness for the nations. Christian Socialists do not deny the necessity of individual Christianity. The first thing to do is for the individual to accept Christ. Repentance, faith, baptism, the sacraments, the individual spiritual life—Christian Socialism is no substitute for these. It is no salvation by the wholesale, by machinery, by power of environment; it is no new gospel of modern thought. It is, rather, simply the carrying out of the full, old gospel, which is to all people. It holds that Christian Socialism follows from and is involved in personal obedience to Christ. It is first Christian. Its starting-point is the Incarnation.

"But this being so, it quickly adds, that while Christian Socialism follows from personal obedience to Christ, it is not enough to-day to say that all that is needed is for the individual to follow Christ. This, while true, is too indefinite. It begs the question. We need to be told what it means to follow Christ. Those sentimental Christians who will listen to naught else, and say that all that is necessary is for individuals to obey Christ, and to induce others to follow Him, are in danger of saying, 'Lord, Lord,' without showing what the Lord would have us do. Christian Socialism tries to voice the social law that it has learned from Christ.

"First, it declares that all men are the children of God's creation, and that in the Son, who is God's eternal purpose manifest in the flesh, their sonship is to be realized, they by Him being reunited to God. This is the starting-point of Christian Socialism. But from this much follows. It follows that men are not merely individuals; they are born united; they are born in one family. It is not necessary, therefore, to develop an organism. The world is one. We simply need to realize what we are. Society makes the individual, more than the individual makes society. Society begins in God. This being so, the first social necessity is to recognize this. We are not to attempt to develop a social system that starts from the individual, but simply to develop the social unity we derive from God.

"Second, the law for the social life Christian Socialism finds in the *Old Testament*. The Mosaic revelation gives the law for society. It founded a theocracy on earth. God was the Universal Father; every man of the theocracy a brother. Property in land was not absolute; the land was conceived as belonging to God. No individual could own it in fee simple. He could

only use it. In its use he was inalienably protected. It came to him through the family as an inalienable inheritance. If, through poverty or misfortune, he temporarily parted with it, it returned to him in the year of jubilee. No landless, homeless class could, therefore, be permanently developed among the Hebrews. (See JUDAISM.)

"The law went farther. It cared especially for the poor, the oppressed, the children, the fatherless, the widow. Usury (or interest: all scholars agree that the two words originally meant the same thing) was positively forbidden between members of His kingdom. The law provided for every one's independence. It not only provided land for the worker, but defended him in the ownership of clothes, tools, etc. (capital), which could not permanently be taken from him. If taken as a pledge, they must be returned before night. No permanent mortgage indebtedness was, therefore, possible on either land or capital; that is, the law was truly socialistic in providing in the name of organized society for both land and capital for every family. And this was not, be it remembered, a law of mere individual righteousness. In order to reap its benefits, the family had to belong to the theocracy. The Jew could take interest from a foreigner; the foreigner could be enslaved, even killed. The law was essentially national and institutional.

"Third, this law can only be fulfilled in *Jesus Christ*. The Hebrew law did not work; no law can work; it is not the function of law to work; man must work the law; hence the Christ, hence conversion, hence the sacraments, hence the means of grace. Jesus Christ came to enable us to fulfil the law. What the law could not do, in that it was weak through the flesh, that Jesus Christ came to fulfil; only the spiritual life must not replace the law, but fulfil it. This is the divine unity. Individualism forgets law; institutionalism forgets grace. A true socialism fulfils the social law through grace. The Old Testament gives the world its social track; Jesus Christ gives the locomotive power. To preach as Tolstolof and most Protestants do, the latter without social organization, is to try and run a locomotive without a track. No wonder that it lands them in the ditch of impossibilities and absurdities. Protestantism has run the world into a quagmire. Jesus Christ is the locomotive power drawing the world along the social track.

"And notice that tho the locomotive is above the track, the track must be laid down first and the locomotive stand upon it. Hence, the Old Testament before the New, the majesty of Sinai before the Sermon on the Mount, the law before the Gospel.

"Fourth, this law, fulfilled through grace, must be fulfilled socially. Protestantism has here made a grievous mistake. But to make a mistake here is to misconceive the whole Incarnation. In Christ, God became man on earth. He took all humanity into Himself. Christ was not only a man, but MAN—man in his entirety; man in all that is in man or possible to man—save sin; man in art, in science, in letters, in politics, in society, in commerce, in industry. In the Incarnation all life entered into God, and God into all life. God's laws are practical. What is impractical is not divine. Now, individualism has been found impractical. Under it men have tried to do good. They have tried to carry out the Golden Rule on individual lines, and they have failed. We do not say they have wholly failed. No earnest effort, even the mistaken, wholly fails. But, generally speaking, they have failed. Large numbers of business men say to-day that the Golden Rule cannot be applied to business. They are right, on the present system of business, because the system is wrong. You 'cannot serve God and Mammon.' You cannot apply God's laws to the devil's methods. The two do not mix. Pathetic, noble but impractical are the desperate efforts of Christian men and women to do good and be Christ-like in modern business. It is a hopeless task. God's way demands a social basis.

"Fifth, Christian Socialism would strive to fulfil the social law through grace, by striving to build up practically a Socialism based on Christ.

"It would aid the eight-hour movement. It would reduce the hours of labor in factory and in shop, that men may have longer hours of labor in the home, the library, and the church. Christian Socialism would favor direct legislation, through the initiative, the referendum, and proportional representation, purging our politics of corruption, breaking down the machine, and teaching the people self-government. It would emancipate woman as well as man. It does not believe in a democracy of half the people. It would develop a true municipalism, as is being done in Birmingham, Glasgow, London, Berlin, and other cities.

Glasgow, by spending \$7,000,000 in tearing down and rebuilding the worst tenements, and by municipally clearing courts and passages; by providing municipal baths, wash-houses, etc., has reduced her death-rate from 54 to 29 per 1000. This Christian Socialism considers practical Christianity. It would have the city employ the unemployed, in ways not to compete with present labor. Says Turgot, whom

A Christian Socialist Program.

Matthew Arnold calls 'the wisest statesman France ever had: 'God, when He made man with wants and rendered labor an indispensable resource, made the right of work the property of every individual; and this property is the first, the most sacred, and the most imprescriptible of all kinds of property.' It would have cities obtain the funds for doing this by conducting gas works, surface railroads, etc., for a profit for the city, instead of having them owned by rich capitalists favored by city franchises.

"Christian Socialists would have the nations own and manage railroads, the telegraph, expressage, etc. In every way it would replace competition by fraternal combination, and it would press toward reform in all these ways. It is not one reform. It is many reforms on one principle. Perhaps most important of all is land reform. Christian Socialism would revert to the Bible principle, that God is the owner of all the earth, and men only entitled to its use. It would, therefore, favor the reclaiming of the land for the use of all the people, by taxing land values on a graduated scale, and increasingly every few years, till finally the whole value of the natural resources of the earth be taken for the people, and not for the favored few. Christian Socialism would not go out of the world to save the world. It would be in it, tho not of it. Gradually it would influence cities, and States, and nations."

CHRISTIAN SOCIALIST LEAGUE, THE, is an English organization which has grown out of a society called the Ministers' Union, formed in London, March 2, 1893. This society adopted the name Christian Socialist League February 8, 1894, and framed a new constitution, of which the following are the clauses of general interest:

OBJECTS.

To assist in the reconstruction of society upon the principles of Jesus Christ, by means of (a) lectures and sermons; (b) publications; (c) civic, personal, and other efforts.

MEMBERSHIP.

1. Candidates shall be proposed and seconded by members from personal knowledge, and shall sign the following declaration: "This country

cannot accurately be called Christian so long as the people in their collective capacity, by their social, industrial, and commercial arrangements, practically deny the Fatherhood of God and the brotherhood of men. The members of the Christian Socialist League believe that the principles of Jesus Christ are directly applicable to all social and economic questions, and that such application to the conditions of our time demands the reconstruction of society upon a basis of association and fraternity."

2. Candidates shall be elected by a unanimous vote of the executive present and voting.

3. A minimum subscription of 1 shilling shall be paid upon election and at each annual meeting.

Branches of the League have been formed in Glasgow, Liverpool, Lymington, Walthamstow, Forest Gate, and Islington. Several lecture tours have been undertaken and considerable activity developed. The League is unsectarian, and uses the word Christian in the broadest sense. The membership is about 250. The President is the Rev. John Clifford, D.D. (q.v.); its Vice-President, J. Bruce Wallace (q.v.); its Secretary, John H. Belcher, 40 Alexander Road, Wimbledon.

CHRISTIAN SOCIALISTS, THE SOCIETY OF, a society organized in Boston, U. S. A., in 1889, but, altho not disbanded, not now in active existence. (See CHRISTIAN SOCIALISM.)

CHRISTIAN SOCIAL UNION, THE, was founded in England in 1889. The Rev. Wilfrid Richmond gave during Lent of that year four lectures on *Economic Morals* at Sion College in London. The four meetings were presided over by the Rev. Canon B. F. Westcott (now Bishop of Durham), the Rev. Canon C. W. Furse, the Rt. Rev. the Lord Bishop of Marlborough, and the Rev. Canon H. S. Holland. At the close of the lectures a provisional committee, with the Rev. Canon H. S. Holland as chairman, was appointed, which chose the name and formulated the objects of the society. The first regularly constituted branch was organized at Oxford, November 16, 1889. The London branch began in 1890. The Oxford branch has been mainly engaged in the systematic study of economic facts; the London branch has been more active in holding public meetings, organizing courses of sermons and issuing addresses on definite political, social, and industrial problems.

The principles of the Union declare that the Union consists of Churchmen who have the following objects at heart:

1. To claim for the Christian law the ultimate authority to rule social practice.
2. To study in common how to apply the moral truths and principles of Christianity to the social and economic difficulties of the present time.
3. To present Christ in practical life as the Living Master and King, the enemy of wrong and selfishness, the power of righteousness and love.

Members are expected to pray for the well-being of the union at Holy Communion, more particularly on or about the following days: The Feast of the Epiphany, the Feast of the Ascension, the Feast of St. Michael and all Angels.

The president of the Union is Dr. Brooke Foss Westcott, the Lord Bishop of Durham, its

secretary the Rev. J. Carter, of Pusey House, Oxford. The president of the Oxford branch is the Rev. Canon Gore. The chairman of the London branch is the Rev. Canon H. Scott Holland, and its secretary the Rev. Percy Dearmer. There are now (1895) 27 branches and about 2600 members. Of these, about one quarter are resident in London, one fifth in Oxford. The Union publishes the *Economic Review*, one of the foremost of the economic quarterlies in England, and the London and Oxford and other branches issue tracts and studies of special topics. The Union in all its branches holds frequent meetings for lectures, discussion, and study. The London branch has a loan library, and the whole Union lays great stress upon economic study. The action of the London branch has been mainly in holding conferences and issuing manifestoes, etc., on practical questions as they have come up in local elections and the development of city life. A recent feature has been the institution of courses of sermons on social subjects in various London churches, but especially at St. Edmund's, Lombard Street, during Lent, when crowded audiences, largely of business men, have listened to the foremost preachers of the English Church. The spirit of the Union may be seen in the following quotations from a tract, *The Ground of Our Appeal*, by Canon Scott Holland :

"1. We start from the conviction which has been for so long stamped on every heart that feels or brain that thinks that the time is come to vote urgency for the social question. We believe that political problems are rapidly giving place to the industrial problem, which is proving itself more and more to be the question of the hour. . . .

"2. We are of those who are convinced that the ultimate solution of this social question is bound to be discovered in the person and life of Christ. He is 'the Man,' and He must be the solution of all human problems. That is our primal creed. . . .

"It is true that this relationship of His to the social life of men is less obvious and direct than His relationship to their sorrows or their sins as the Redeemer. For the victory which gained Him this living lordship over all that man is was won by Him not in the social, or economic, or political, but in the *spiritual* sphere. He redeemed men's souls from sin. That was His primary task; . . . but its significance is bound to tell on every level of existence down to which the influence of the victorious Spirit reaches. The whole of human nature is to be brought within the sway of the 'New Man.' And human nature is corporate; 'man is a social animal.' The natural bonds which hold together men into societies and races must, of necessity, receive the new inflowing force which comes to them out of the supremacy of Him, who gathers all men into Himself.

"3. But this application of the redemptive force of Christ to actual society can be no very simple matter. The problems raised by human society are manifold, intricate, and immense; and however firm our conviction may be that Christ is Himself their one and only solution, yet the solution of a difficult problem must, of necessity, be itself difficult; and if the perplexities have been themselves a matter of long and gradual growth, then their undoing, also, will be slow and gradual.

"These are the questions; and they can only be answered by those who have got long past the merely sentimental assertion that Christ is 'all in all,' and have set themselves to the solid task of discovering what that solemn truth really and precisely means, and have worked it down into the concrete facts, and have surveyed and estimated the full need of the circumstances, and striven to make clear to themselves what is the first step, and what the second, and the third, if that great royalty of Christ is, in very deed, ever to be made good here on earth, amid men as they are, and after a history such as they have hitherto had.

"We cannot all of us undertake such a study as this involves; we have not the leisure or the brains. But

that is just why we should all take some direct measures for keeping in touch with those who have the faculties and the opportunities that we lack. Some servants of the Church there *must* be who will give themselves seriously to the training that such a task involves. . . . They will arrive at the discussion possessed by two deep convictions: First, that the present situation is intolerable; and, secondly, that its solution must be found in the unflinching assertion of *moral*, as supreme over *mechanical*, laws. . . . It is to collect together such men as this, it is to foster and to enlarge such a spirit, that the Christian Social Union exists."

It should be added that the Union is committed to no one school of economic thought, altho its tendencies are recognized in the fact that its teachings are often called in England the new Christian Socialism. For the difference, however, between its position and those of the early and other Christian Socialists see that article. There are affiliated societies in the United States, Canada, South Africa, and Australia, but the branch in the United States is now called the Church Social Union (*q.v.*).

CHURCH AND SOCIAL REFORM,

THE.—In another article we treat of *Christianity and Social Reform*; it seems necessary, however, to consider here the *Church and Social Reform* in an article by itself; first, because very many make a sharp distinction between the ideal relations of Christianity to reform and the actual relations of the Church to reform, and, secondly, because whatever be one's opinion concerning the Church, all are agreed upon the immense power wielded by the Church, be it for evil or for good, and also upon the intricate connection between the Church and the advancement or retardation of social reform. We consider the subject under the following heads:

1. The Apostolic Church.
2. The Primitive Church after the Apostolic Period.
3. The Medieval Church.
4. The Church from the Reformation to the Present Time.
5. The Modern Church.
6. The General Possible Relations of the Church to Social Reform.

I. THE APOSTOLIC CHURCH.

We here consider the Church as commencing with the apostles and their followers in the upper chamber at Jerusalem. (For the beginnings of the Church in the Hebrew theocracy, and the relations of that theocracy to social reform, see JUDAISM; for the teachings of Christ in regard to society, see CHRIST AND SOCIAL REFORM.) That the Church as organized in Jerusalem had vital relation to social life needs no reiteration. (See article COMMUNISM, etc.) The indisputable record is that the members had "all things in common," and that to each was given "according as any man had need." It is, however, perhaps necessary to point out that this was not an accident or mere passing incident in the history of the apostolic Church, born of the enthusiasm of its first love, but rather the necessary and logical result of the very character and nature of the Church. The first Christians of Jerusalem were drawn from among the Jews or from among the proselytes to the Jewish faith, the "strangers within the gates." They were

therefore familiar with the social teachings and requirements of the Jewish law and the Jewish Scriptures. Any one who knows what these were—their care for the

The Church of the Upper Chamber. afflicted, the oppressed, the fatherless and the widow, their minute directions as to the organization of

social life, their provisions for securing land *in perpetuo* to every individual for *use*, while in ownership it was held as belonging to God, their prohibition of usury and oppression in every form, and, *above all*, the recognition of all this as binding because it was *the law of God*, to be taught, upheld, and enforced by the institutes and officers of the national religion—any one, we say, who at all realizes this cannot wonder that the first act of the first Christian Church was to apply its pentecostal love to the conduct and the ordering of property and of the social life. Jesus Christ had enforced this spirit. He had taught both by word and deed that He had come as a King, with authority over all life, social as well as spiritual. He had fed the hungry, healed the sick, raised the dead. He had entered Jerusalem as a King. He had in every word taught of the kingdom of heaven as the great summation of His life and as near at hand, on earth as truly as in heaven. (See CHRIST AND SOCIAL REFORM.)

Yet it must be also noted that this so-called communism of the Church of Jerusalem was not one of law and of requirement. Love was the fulfilling of the law. The incident of Ananias and Sapphira (Acts v. 1-11) shows that there was no *requirement* to renounce private property in land or houses. Until the disciples had given property to the Church, their property remained their own. It was only out of their *love* that "as many as were possessors of lands or houses sold them and brought the prices of the things that were sold and laid them at the apostles' feet, and distribution was made unto each, according as any one had need." But with this *caveat* against the conception of the primitive communism of the Church as a formal, compulsory one, too much emphasis cannot be laid upon it as a fact, and as the necessary and logical outcome of their love and of their faith.

Nor are we to think of it as peculiar to the Church at Jerusalem. While it is true that we do not know so much of the communism of any other Church, and while but little has come down to us in any way of

the life of other Christian churches **Primitive Christianity.** of the first century, the indications nevertheless are very strongly against the communism of the Jerusalem church being exceptional. All that we know points to its *not* being exceptional. In the Book of the Acts and in the Epistles there are abundant references to the life of love as carried on in these other churches. We have Dorcas, or Tabitha, at Joppa (Acts ix. 36) "full of good works." Paul writes to the Corinthians (2 Cor. ix. 6) about giving to the poor. He praises the Christians of Macedonia (2 Cor. viii. 2) for giving almost beyond their power. He orders the churches both of Galatia and Corinth (1 Cor. xvi. 2) to lay by a store for charity "on the first day of the week," as each person was

pered. St. James declares that "pure religion and undefiled before our God and Father is this: to visit the fatherless and widows in affliction, and to keep himself unspotted from the world." We read of the churches at Troas (Acts xx. 6) and at Corinth holding *agape* or love feasts, where they came together to break bread. Jude 12 indicates that this was a common custom in all the churches. 1 Tim. v. 3 indicates the duty of the widow (or deaconess) to wash the saints' feet, entertain strangers, bring up children, relieve the afflicted. Hospitality is continually urged. The slave is to be treated as "a brother beloved" (Philemon xvi.). These are but few of the incidental references in the New Testament to the life of the apostolic Church, indicating that the life of the churches everywhere was like that of the Church at Jerusalem, a communism of love, though not of law and of requirement. If it be said that the fact that St. Paul took up a collection for the poor saints at Jerusalem is indicative of a peculiar condition in that Church, and that their communism and giving up of private property had brought them into special poverty, it may be said, on the other hand, that the Church at Jerusalem was under notorious and excessive persecution, as during the first century the churches throughout the rest of the Roman Empire were not, and this is sufficient to account for their especial need of help. From the days of Nehemiah, as has been well said, to those of Sir Moses Montefiore, it has been customary to send aid to Jerusalem. The argument, therefore, for holding that the communism at Jerusalem was peculiar is invalidated by the general probability and indication that it was not the case.

And this is rendered the more probable by one other strong circumstance. It appears (cf. Heinrich, *The Christian Church of Corinth* and the *Religious Communities of the Greeks in the Zeitschrift für wissenschaftliche Theologie*, 1876, iv.; Uhlhorn's *Christian Charity in the Ancient Church*, and the whole of C. Osborn Ward's *The Ancient Lowly*) that as soon as the Church emerges into recognized form, its legal position in the Roman Empire was as a *collegium*, very much resembling the *collegia tenuiorum*, or sodalities of the poor, organized to collect contributions for the poor or for special ends, such as burial, etc. For a full account of these, see GUILDS; but we must here note the similarity between these and the early churches in their social life.

Tertullian uses the same words, *steps* and *arca*, for the contribution and contribution chest of the Church as were technically employed in the *collegia* for their collections. These *collegia* had their presiding officers, or *magistri*, for their meeting places, more or less humble, according to their wealth. They had regular meeting times and dues for various purposes, mainly of benefit, but sometimes for carousals. They had banquets or meals together. Some of them had considerable wealth, lands, houses, etc., being donated to them by wealthy members or patrons. On appointed days there were *sportula*, or distributions of bread, wine, or money among the members. Members were called brothers and sisters, and their presiding officers fathers and mothers (for there were women among them as truly as men). It is evident how close these were in resemblance to the social organization of the Church at Jerusalem, with its contributions, its officers, its gifts of houses and land, its common meals, its organized distribution "in the daily ministrations" to the widows and those in need. Now if these *collegia*, so exactly in this respect like the Church in Jerusalem,

existed through all the empire, as seems proven, and that legally the churches all through the empire were regarded as *collegia*, and used the very technical terms of the *collegia*, does it not indicate almost beyond a doubt that the picture given in the acts of the Church at Jerusalem is a picture of every church in the apostolic days, with its life and feasts of Christian love, and deeds of charity, and voluntary and common renunciation of private property, and also with its spots on its feasts of charity, in the murmuring of the Grecians at Jerusalem because their widows were neglected in the ministration, and also in the excesses to which the love-feasts were carried in Corinth and in other places?

The Church, even in apostolic days, was by no means immaculate; it was *being* saved, not wholly sanctified; but its very essence and its inmost spirit was a life of brotherhood and of practical love upon this earth.

2. THE PRIMITIVE CHURCH AFTER APOSTOLIC DAYS.

We come here into fuller light, and may consider the subject in detail, dividing the subject into parts, considering, first, the spirit of *equality* and of *brotherhood* that prevailed in the primitive Church. The

Spirit of Equality. Roman Empire was full of poverty and distress. Slavery was universal. Uhlhorn estimates that at Rome under Augustus there were 580,000 proletarians needing support to 90,000 senators, knights, soldiers, and traders not needing support, and this does not include the slaves, who composed the large masses of the population. (See *CITIES*.) At Athens at one time, according to some historians, there were 400,000 slaves to 31,000 citizens; according to others, 200,000 to 100,000. In Italy, according to Blair, there were under Claudius nearly 30,000,000 slaves to 7,000,000 free men; and though these figures may be too high, according to all, the slave population was in an immense majority. This, of course, meant widespread suffering beneath a corrupt aristocracy of enormous wealth.

The working-class lived, and little more. Momsen reckons the Roman bushel of wheat at 1 denarius, and this was the usual day's wage. Meat was proportionally dear. Diocletian fixed the price of beef and mutton at about 30 cents the kilogram, and a fowl at the same price. A modest dwelling in the upper stories of one of the large lodging-houses at Rome came to about \$80. On the other hand, the wealth of the few was enormous. The augur, Cn. Lentulus, and Narcissus, Nero's freedman, were said to own \$22,000,000. *Latifundia* were growing. Cæcilius, a freedman of Augustus, left in his will, Pliny tells us, 116 slaves. It is true that this does not indicate either such wealth on the part of the rich, or such poverty on the part of the laborer as we have to-day; but the worst of the slave condition under the Roman Empire was the lack of civil or moral standing: he could be sold, killed, violated, thrown to the fishes at pleasure with impunity. Such was the society in which the Christian Church took root. In *CHRISTIANITY AND SOCIAL REFORM* we have traced the influence of Christianity upon the laws and organized society, and have shown how it gradually overthrew slavery. Here we are simply concerned with what the Church did directly as a church, and upon this point it was to introduce the feeling of equality and of brotherhood, in opposition to aristocracy and slavery. The Church spread at first, it is evident, mainly among the slaves and the oppressed. Hence it was powerless directly to affect the legislation of proud emperors and senators, but it did welcome the slave to its fold as an equal and it did practice brotherhood among men. It taught that being descended from one Father, all men were equal. "We are all born alike, both emperors and beggars," said an early Christian writer (*Breviarium in Psalt.*, in

opp. Hieron., vol. ii., p. 233). "Thou sayest that thy father is consul and thy mother holy and good," says Chrysostom; "what does it matter to me? Show me thy own life, for it is only by that I can be able to judge of thy nobility" (Or. in *terra motum et Lazarum*, § 6, vol. i., p. 782). Man is "the great work of God" (Ambrose, *Sermo* 10, in Ps. cxviii.). "The world is a vast republic, a great family of God's children," writes Tertullian (*Apol.* xxxviii.). The whole of Christianity the early Church found in charity rather than in hope or faith (*Zeno Veron.* Book I., tract 2, p. 111). Chrysostom puts it above fasts or solitary penances. Love, gentleness, almsgiving, are greater, according to him, than celibacy (*Hom.* 1., in Matt., § 7). "Love on earth must be without thought of earthly profit or heavenly recompense" (Orig., *Contra Cels.*, 1., 67, vol. i., p. 382). Gregory Nazianzen says: "Rich and poor, strong and weak, servant and freeman, have one only Head, from whom everything comes, Christ Jesus. What the members of the body are for each other, each among us is for his brothers, and all for each" (Greg. Naz., Or. 16, vol. i., p. 243). Of this unity the *agape*, or love-feasts, were symbols. "Here they brought the poor and the needy" (*Constit. Apost.*, II., 28, p. 243). The Church, Augustine calls "a spiritual republic in the midst of a pagan society" (*De opere Monach.* chap. xv., vol. vi., p. 363). At first at least the Christian Church did not favor monasticism. Their communism

Spirit of Brotherhood. "Christians," says one, "are not distinguished from other nations either by language, dress, or habits. They do not shut themselves up in particular towns, but live where they were born, in the midst of Greeks or barbarians. They are different from pagans in conduct, and their life is altogether distinct" (*Ep. ad Diogn.*, chap. iii., p. 237). They honored the magistrates and prayed for them, and for the emperor, who was their earthly head, as Jesus Christ was head in the kingdom of God (*Polyc. Ep.*, chap. xii., p. 191; Just., M., l. c.; Athenag., *Leg. chap.* xxxvii., p. 313). The Christians obeyed all laws save those which compromised their faith, such as giving divine honors to the emperors, bowing before idols, swearing by their genii. Here they were inflexible. The aged Polycarp, summoned by the proconsul to swear by the genius of Cæsar, refused to do so, but was willing to obey in all else. Ambrose reckons it among the duties of an ecclesiastic to take an interest in the oppressed and suffering. "Your office will shine gloriously," he writes, "if the oppression of widows and orphans attempted by the powerful should be hindered by the servants of the Church; if you show that the commandment of the Lord is more to you than the favor of the rich" (*De Offic.*, II., 22). Athanasius excommunicated the viceroy of Lydia, notorious for his cruelty and excesses, and Basil declared that the Church agreed with him (*Bas. Ep.*, 16). Synesius of Ptolemais excluded from the Church the Prefect Andronicus for the same reason, having first in vain warned him (*Synesii Epp.*, 57, 58, 72). When the inhabitants of Antioch were trembling before the wrath of the emperor, because they had overthrown his statues, Bishop Flavian went to Constantinople to intercede, while Chrysostom preached his famous "statue sermons," and when prosecutions began, a monk, seizing the bridle of the judges as they were riding, cried: "Tell the emperor you are not only an emperor, but a man, and those you reign over are your fellowmen. Human nature was made in the image of God; do not then so mercilessly and cruelly destroy the image of God." The story of Ambrose himself expelling Theodosius the Great from both Church and sacrament till he did public penance, for having allowed his soldiers a massacre at Thessalonica, is well known. The Church became the sanctuary of the oppressed. When a debtor, sued for 17 solidi (about \$15), fled to the Church, Augustine paid the debt. He who violated the right of sanctuary was excommunicated.

Relation to the State. Next to the spirit of the equality and brotherhood and protection to the oppressed, we notice what the primitive Church did for the *family* and for *woman*. Under Rome woman was either the slave, the toy, or the property of man. The Church recognized her equality.

"I do not know anything more unjust," said Augustine of the Roman laws which kept women in an infe-

rior position (*De Civit. Dei* iii, chap. xxi., vol. vii., p. 63); and all the Fathers teach the equality of man and woman (Clem. Alex., *Pædag.*, I., 4, vol. i., p. 103; Greg. Naz., *Or.*, 33, 4, vol. i., p. 322; Greg. Nys., *Or.*, 1, in *Verba Jac. Hom.*, vol. i., p. 151). Marriage was

The Church and Woman.

regarded in its spiritual aspect as for eternity an association of souls rather than of bodies (Athenag., *Leg.*, chap. xxxiii., p. 311). It was a type of the union of Christ with His Church (Chrysost., *Hom.*, 12 in col., § 5, vol. xi., p. 419). Some of the Fathers, such as Ambrose and Augustine, began to exalt celibacy and virginity above marriage, but in the beginning it was not so; and was never so with all the Fathers. With Chrysostom a true man and wife joined in sacred union show a holier life than the inhabitants of many a monastery (*Hom.*, I., in *Rom.* xvi. 3, vol. iii., p. 175). In marriage, the woman, according to the Fathers, was wedded to the husband as the Church to its Head. Chrysostom says: "Woman can neither carry arms nor vote in the assemblies, nor manage the commune, but she can weave thread, give better advice than her husband about domestic matters, rule and keep order in her household, superintend the servants, and bring up the children. Each sex has its special vocation. God has not given all to one. He has wisely divided it" (Chrysost., *Quales Duceude sint Uxores*, vol. iii., p. 127). "Nothing," he says further, "can better mold man than a pious and wise woman" (Chrysost. I. c.; *Sermo*, 4, in *Gen.*, § 1, vol. iv., p. 659). Mixed marriages between pagans and Christians were frowned upon. Second marriages were discouraged. Tertullian said that "he who marries again commits a decent kind of adultery" (Athenag., *Leg.*, 33, p. 311). Montanists absolutely forbade second marriages, but after the time of Augustine it was a heresy to condemn second marriages. Adultery was the only admitted cause of divorce, and then separation was usually recommended. Purity was required of both sexes equally. "The laws of the Cæsars are different from the laws of Christ," says Jerome. "With us, on the contrary, what is not permitted for women is also forbidden for men" (*Ep.* 77, Ann. 399, vol. I., p. 459). Nevertheless, condemning strictly their vice, the Church welcomed the Magdalenes, and many of them became noble martyrs. Pelagia, a celebrated courtesan of Antioch, was converted and retired to a convent, and spent the rest of her life in humble piety. Afra died for her Saviour in Augsburg with three servants, who, having followed her in vice, followed also in conversion. Similarly high was the position of the Church in regard to children. At a time when abortion and exposure were frequent, the Fathers declared that to cause a child to perish by abortion is to destroy the work of God. God is the father of all life, however incomplete it be. Those guilty of it were excluded from the Church for 10 years (*Const. Apost.*, vii., 3, p. 266). Exposure was still more condemned. The Church welcomed the children. "If old sinners," says Cyprian, "are received in the Christian community, how much with greater reason shall the new-born child be received, who has not yet committed sin?" (*Ep.* 59, p. 99). This was true even of natural children. They were still under God's paternal care, and to be welcomed by the Church (Methodius, *Conviv.* x. *Virginum*, or. 2, in *Combellis*). According to Chrysostom, what has upset the whole world is that man has not cared more for his own children (*Hom. de Viduis*, vol. iii., p. 317). Chrysostom and Jerome especially urge upon mothers to rightly influence the children. Thus we have in the early Church Monica, the mother of Augustine; Nonna, the mother of Gregory of Nazianzus; Anthusa, the mother of Chrysostom. The first schools that may be called primary were kept in the fourth century by Christian priests (Palladius, *Vita Chrys.*; in *Opp.*, vol. xiii., p. 77). Basil during his rule made it an special duty (*Regula Fustus. Tract.*, *interrog.*, 15 et 23, vol. ii., p. 355).

We come next to the relation of the primitive Church to the laboring classes. These, according to all classic antiquity, were despised. Artisans, according to

The Church and the Working Classes.

Aristotle, were not worthy of the name of citizens (*O.*, chap. ii., 1). Almost all manual and most mental work was done by slaves. By the Christian Church work was honored. They neither felt themselves to be miserable nor disgraced because they

had to work with their hands (*Ep. ad. Zenam et Serenum*, chap. xvii., in *Opp. Just. Mart.*, p. 416). They remembered Christ the carpenter and Paul the tent-maker. The *Apostolic Constitutions* forbid a man to mix with the idle crowd, and advise him to engage in useful work, having his soul turned toward God (Book I., chap. iv.). The necessity of teaching youthful arts to children was dwelt upon (*Const. Apost.*, Book IV., chap. xi., p. 301). They taught that if a man did not work, "neither should he eat."

The relation of the Church to slavery has been much discussed. The primitive Church did not immediately seek to overthrow slavery, but did undermine it. Before the Reformation slavery had wholly disappeared from Christian lands, and long before that it had almost disappeared. The Church started among the poor, and despised by the powerful, had not the power to abolish the institution in any legal way. But while the Church long allowed slavery, it did much to alleviate it, and welcomed the slave as an equal; only in later years did the Church ever practise slavery.

"No one is a slave by nature," say Clement of Alexandria and Basil (Clem. Alex., *Pædag.*, III., chap. xii., vol. 1, p. 207; Basil, *De Spir.*, s., I., chap. xxi., vol. iii., p. 42). Chrysostom says God, who created the two first beings free and equal, never created slaves to serve them (*Hom. 22 in Eph.*, § 2, vol. xi., p. 167). Some of the Fathers held that slavery was punishment, but they held so of all work, and yet that work was honorable. "I call noble and lord," says Chrysostom, "the slave who is covered with chains, if it accords with his life; I call him low and ignoble who in the midst of dignities retains an enslaved soul" (Or. in *Terræ Motum et Laz.*, § 7, vol. i., p. 782). In the Church slavery was only an accidental external condition which did not affect the moral worth. Again and again, the Church taught that Christianity was service. Christians called themselves, like St. Paul, servants or bondservants (*δουλο*) of Christ. Ignatius wrote of the slaves: "Let them continue to serve without murmuring, and God will give them a better than earthly liberty" (*Ad. Polyx.*, chap. iv., p. 41). Slaves were recommended to bear servitude in the passing world of exile, where none is free, and beyond which the Christian expects deliverance and glory (August., *De Agone Christiana*, chap. vii., vol. vi., p. 181). In 451, the Council of Chalcedon forbade the convents to receive slaves without the consent of their masters, "in order that the name of God be not dishonored" (Canon IV.). Many slaves bore noble testimony to their master, Christ, such as Potamizena, Eutyches, Victorinus, Maro, Nereus, Vitalis, and others. But while bidding the slave be patient, the Church spoke plainly to the Master. Said Chrysostom: "Do not imagine that an injury to a slave will be regarded as indifferent, because it is only to a slave. The laws of the world see a difference between the two races; but the laws of the commonwealth of God ignore it" (Chrysost. *Hom. 22, in Eph.*, § 2, vol. xi., p. 167).

We observe the difference between the recognition of slavery by the primitive Church and its recognition too frequently by the Church in modern times. The primitive Church recognized it as a human institution, which they were to submit to. The modern Church too often tried to prove slavery a Divine institution. Masters were told by the primitive Church to love their slaves as sons and as equals (*Const. Apost.*, Book IV., chap. xii., p. 302). The Church refused to receive the gifts of the master who ill treated his slaves (*Const. Apost.*, Book IV., chap. vi., p. 197). There were in the early Church families where master and servants formed one family.

When Thecla was cited to appear before the tribunal,

50 of her slaves, urged by gratitude, appeared in her favor (*Acta ss.*, January, vol. i., p. 601). Paula, a descendant of Paulus, Æmilius, Leo, and Fabiola are spoken of as the servants rather than the mistresses of their women. But the Fathers went farther than to counsel gentleness. They urged masters to free their slaves. Gregory Nazianzen and Chrysostom are prominent in such exhortations, and many masters did the same. The earliest instance that has come down to us is that of Hermes, Prefect of Rome under Trajan, who embraced Christianity with his wife, children, and 1250 slaves, whom he freed on the day of their baptism, Easter day, with ample assistance to enable them to gain a livelihood. He himself afterward suffered martyrdom with Bishop Alexander, who had been the means of his conversion. Another prefect of Rome, Chromatius, under Diocletian, freed his 1400 slaves, saying that those who had God for their father ought not to be the servants of man. Melania, with the consent of her husband, Pinitus, freed 8000 slaves; Onovius, a French martyr, 5000.

The Church especially did her utmost to end the horrors of the *gladiatorial* combats and the degradation of the *theatrical* exhibitions. The

Church refused baptism to gladiators unless they gave up their profession. Lactantius said: "Instead of buying and feeding wild beasts, ransom prisoners and feed the poor; instead of bringing together men to

kill each other, go and bury the innocent dead" (*Div. Instit.*, Book VI., chap. xii., vol. i., p. 470). From the theaters, at this time grossly immoral, Christians were warned to absent themselves. Those who, in spite of warnings, still attended, were declared unworthy of Christian communion.

Christians were urged to find their exhibitions in nature. "What theater," says one writer, "constructed by the hand of man can equal these wonders of creation" (*Traet. de Spect.*, in *Opp. Cyr.*, p. 322)! Actors who became Christians and had no other means of earning a livelihood, such as Euchratius, were provided for by the Church through the efforts of Cyprian.

We come now to consider the relation of the primitive Church to the *poor*, and in its property relations in general. This may be said to be a more or less faithful carrying out of the voluntary communal life of Jerusalem. There seems to be no evidence that there was anywhere established by the primitive Church a mechanical communism. Voluntary communism seems to have been the ideal to which they always tended, though sometimes very vaguely and remotely. The emphasis was on love. "It is not the census," said Ambrose, "but the qualities of the soul, that show the rich man" (*Ep.*, chap. lxiii., § 89, vol. ii., p. 1044). Barnabas, in warmly commending charity, argues that "we ought not to consider anything as belonging to ourselves alone, but to share everything with our neighbor; for if there is communion in spiritual and everlasting things, with how much greater right ought it to exist in these material things" (chap. xix., p. 52). Ambrose of Milan wrote, "Nature created everything for common use. If, then, there are men who are excluded from the enjoyment of the products of the earth, it is contrary to nature. The unequal division of this wealth is the result of egoism and violence. Nature is the mother of common right, usurpation is the mother of private right" (*De Off. Ministr.*, Book I., chap. xxviii., § 132, vol. ii., p. 35).

The early Church opposed riches as hindering salvation, but Augustine, Ambrose, Jerome, and others

teach that riches are not to be condemned in themselves. "Neither is every poor man a saint, . . . nor is every rich man condemned," wrote one (Asterius, *De Divite et Lazaro*, p. 13). "The hand of the Christian," said the same writer, Asterius, "ought only to be held out to give alms, never to seize what does not belong to him" (*Hom. de Economo, Iniquo*, p. 23). The giving of charity the primitive Church exalted. "It is better to do the works of charity than to ornament churches, or to enrich them with precious vases" (Hieron., *Ep.* 130, vol. i., p. 907). The priests were to lead in this, especially the bishops. The *Apostolic Constitutions* lay down their duties in these words: "To orphans take the place of a father; to widows give the protection that they would have from their husbands; help young people who desire to marry with your counsels; find work for the artisans; have pity on the infirm; receive strangers beneath your roof; give food and drink to those who are hungry and thirsty and clothes to the naked; visit the sick and help the prisoners" (Book IV., 2, p. 295). Charity was to cost sacrifice. We read of the early Christians fasting that they might give to the poor (*Constit. Apost.*, V. xx., p. 331). Deaconesses were appointed to aid poor women. Under Bishop Cornelius, toward the close of the third century, the Church of Rome supported more than 1500 poor people. The Church of Antioch, in the time of Chrysostom, maintained more than 3000. The Church of Rome, under Bishop Sotir, in the second half of the second century, and 100 years later, under Bishop Stephen, sent money collected in distant provinces, sometimes to help populations wasted in famine, sometimes to lighten the burdens of the persecuted. Prelates sold the vases and ornaments of their churches to aid the poor. This was done by Cyril, by Acacius, Bishop of Amida, who sold 420 vases and sent back to freedom 7000 imprisoned Persians, and by Deogratias, of Carthage. Augustine and Ambrose did it to ransom captives. Paulinus of Nola and Hilary of Arles sold their large estates for the poor. Martin of Tours sacrificed his sacerdotal robes. The Bishop of Escupère, of Toulouse, went hungry and used only basket and glass for the bread and wine of the Eucharist, in order to help the poor. When the martyr Lawrence was asked by the pagan governor for the treasures of the Church, he showed him the poor. Peter, the tax-gatherer, in the time of Justinian, on being converted, expiated his harshness by selling himself to a slave merchant for the benefit of the poor. Clement of Rome writes to the Church in Corinth: "We have among us many who have given themselves to servitude in order that others might be free." It is told of Bishop Eleusis, of Cyzicus, that he took the pagan temples and made them into hospitals for the old and widowed. The first orphan-houses are of this period, and were cared for by priests. Special collections were made for prisoners. The poor denied themselves a day's food to give to these. The funds of the Church were used to ransom brothers sentenced to public works or the arena. The Church was the asylum. Even Alaric, on taking Rome, is reported to have spared those who took refuge in the churches. The innocent went to the bishops for redress. In the midst of universal anarchy, the bishops raised their voices in behalf of outraged humanity. It was one of their special duties to save defenseless men from the hands of powerful oppressors and to intercede with the emperors and magistrates in their behalf; to undertake long journeys and brave all wrath, provided the cause of those in whom they were interested was just. Most frequently we find bishops giving assistance to country people, who suffered from the rapacity of the fiscal agents, the avarice of the usurers, the oppression of great proprietors. For the sick, the primitive Church did much, even for the lepers. Basil advises that lepers be not deserted, but be loved the more for the miseries of their desolation. During the plague of Carthage, about 250 A.D., and during that of Alexandria, the Christians showed great bravery and love. The first hospitals are due to the Church, the first being established in the early part of the fourth century. From the latter half of this century they multiplied greatly. The most important of these was founded by Basil in Cæsarea. It rose, says Gregory Nazianzen, like a new town, providing lodgings for travelers, rooms for invalids, workshops for the poor, provision for lepers. It bore the name of Basiliæ. Chrysostom founded several hospitals. By the time of Theodosius most of the large towns had hospitals. The hermit Thalassius founded one for the blind.

Ransoming Captives.

The early Church was especially remarkable for its sacrifices in behalf of its *enemies*. Ter-

tullian could truly say that "if all men loved their friends, the Christians alone knew how to love their enemies" (*Ad Scap.*, i., p. 69). The Fathers, too, with their profound respect for human life, unanimously condemned capital punishment. The Council of Elvira (A.D. 305) excludes the magistrates whose duties as decemvirs caused them to judge cases involving capital punishment from joining in worship during the year. The emphasis the early Church put upon *hospitality* is well known, as is also its universal opposition to *war*.

It is well to notice the organization of the Church for practical charities. At first there was little or none.

"We give to all and communicate to every one who is in need," says Justin (*Apolog.*, i., 14). The shepherd of Hermas says: "Give simply to all, without asking doubtfully to whom thou givest, but give to all" (*Pastor Hermas*, Mand., II.). Clement of Alexandria warns against trying to judge who is deserving and who undeserving (*Quis dicitur salvus*, chap. xiii.).

Charities.

Concerning the giving up of property, Hermas says to Christians: "You are dwelling here in a foreign city. Would any one dwelling in a foreign city provide himself with fields and expensive accommodations?" (*Similit.*, I). The Church was in the world, but not of it. "We are no Brahmans nor Indian gymnosophists; no wild men of the woods and separatists from life. We are mindful of the gratitude which we owe to the Lord our God, and do not despise the enjoyment of His works," wrote Tertullian (*Apolog.*, 42). But the Fathers everywhere counseled simplicity of life. "On the road to heaven," says Clement, "the best provision is frugality, moderation is the shoe, and beneficence the staff" (*Pædagog.*, III., 7). Clement pities the insatiable who collect their dainties from all parts of the world, with whom "the basting ladies and the kitchen form the central point of existence" (*Pædagog.*, I., 1). In an old catalogue of the apostles, Peter, Andrew, and the sons of Zebedee are fishermen; Philip, an ass driver; Bartholomew, a vegetable gardener; James, the son of Alphæus, a mason. Later, when the Church became corrupt, men like Chrysostom vehemently attacked the luxury of the day. Said Chrysostom of the luxuriously dressed woman: "Of how many poor, O woman, dost thou bear upon thine arms the spoils!" Yet, even when the Church was at her simplest, there was some organization for charity. Deacons, deaconesses, and widows, who were considered officers in the Church, had special charge of the charities, but always under the direct guidance of the bishops. Alms were collected and distributed largely at the *agapæ*, which were first suppers in common for all church-members, later suppers for the poor, and finally occasions of drunkenness and excesses. Montanism tried to react from these excesses and any compromise with the world by strict discipline and limiting church-membership to the select few, but this was to make the Church separatist and sectarian and sacrifice her power as a Church for the world. It taught the Church to distinguish between the "religious" and the "secular," sending the "religious" into monasticism and asceticism, and the "secular" into worldliness.

Gradually we find as a result of this the alliance of the Church with the State, still more developing its worldliness, till it came to palliate, allow and endorse and even own slaves (so that even so pure a spirit as Gregory the Great makes no apology for having a fugitive slave brought back "by any means" from Otranto, though he was also torn from wife and children, to serve as a baker in Rome). The Church gradually thus became full of all such worldliness as called forth the burning protests of Chrysostom. On the other hand, we have the development of monasticism, for the social results of which see MONASTICISM. Still through all the earlier centuries the Church was not only the friend but the leader of social reform. If she did not abolish slavery or advocate all the social reforms

that are suggested to-day, it was because they were not proposed. She was at least on the side of the most radical reform there was, or, rather, the mother and the life of all reform. On the whole, well could Tertullian point to the life and love of the Church, which to the jealous hatred of its enemies was a reproach. "See how they love one another," mocked these enemies; "as if they were ready to die, the one for the other." "Yes," said Tertullian, "we love one another; we are brothers, for we have a common Father, and the same Spirit has led us from darkness to light. We are also your brothers, because, although you are our persecutors, you are men like us. We support one another; we have everything in common except our wives; each one freely brings his offering to relieve the poor, the sick, orphans, widows, travelers, and prisoners. We are not incapable of the business of life, for do we not live with you, sharing your habits and necessities? We do not retire into forests; we do not flee from life; we use everything with thanksgiving; we sail with you; we mix with you in the Forum, in camp, in commerce; we refrain only from your spectacles, sacrifices, disorders, and crimes" (*Apologeticus*, about 198 A.D.).

3. THE MEDIEVAL CHURCH.

In this section we shall not enter so much into detail, because the details are given in other articles: that on the CANON LAW, which belongs almost exclusively to the medieval Church, and the general article on CHRISTIANITY AND SOCIAL REFORM, Christian influence, in the Middle Ages at least, being admittedly almost identical with Church influence. Yet a few general characterizations may here be made, and one or two points elucidated.

We notice, first, that the medieval Church was always the great leveler; that the clerical order was the one profession in which it was possible for a man of the humblest birth to attain to the highest position. This was less by virtue of express enactment than in consequence of the facts (a) that the Church remained free from the distinctions of classes that grew up in the civil State, and (b) that the churchman, as the rule of celibacy became universally accepted in Latin Christendom, could be raised to any rank without the drawback of his founding a family of nobles. Many a peasant heard doubtless of the learned Grosstê, the son of a serf, the most distinguished scholar of thirteenth century Oxford, of the Oxford which existed long before a college was founded—the friend of the reforming friars, the enemy of the Roman court, the advocate of England for the English; and was eager, out of his scanty means, to buy the license that his son might go to the schools and take orders. The possibility of rising was, it is true, not confined to churchmen; but that which was the exception among the laity was common among the clergy; and in one important point, with respect to slavery, the exemption of the clerical status from the classes of civil society produced a remarkable relaxation of class conditions.

It was not, however, for many centuries that it became the accepted doctrine that an ordained person was *ipso facto* a free man.

If, however, in the fifth century it could be conceived as possible that a man might be a clergyman and yet a slave, this idea early gave way before another, which presumed that if a slave were ordained with the knowledge of his lord, and without any objection raised by him, he was a free man, tho not formally manumitted.

For the effect, however, of the medieval Church upon slavery, see CHRISTIANITY AND SOCIAL REFORM. It must not be forgotten that before the time of the Reformation slavery, and, in some countries like England, even serfdom, had disappeared from Christendom. The medieval Church had put it down.

We notice next as characteristic of the medieval Church its monasteries and nunneries and Church brotherhoods of various kinds, not only as centers of Christian equality, but as asylums for the oppressed and as centers of brotherhood life and work. Says Thorold Rogers upon this point:

"The relief of destitution was the fundamental religious duty of medieval Christianity, I might have said of Christianity itself. In ancient politics it might be the duty of the State to relieve distress; it was always its prudence, if it cared for security. To get abundant supplies of food for the poorer citizens in one way or the other was the constant anxiety of democratic Athens and of imperial Rome. But from the very first Christianity transferred this duty from the State to the individual, and to the voluntary corporation. The early Church undoubtedly preached patience, but it much more emphatically inculcated the duty of almsgiving. The contribution of the tithe was enforced in order that a third part, at least, of the proceeds should go

Monasteries.

to the relief of the deserving poor. In the fifteenth century nothing moves the righteous wrath of Gascoigne more than the teaching of Peacock to the effect that ecclesiastical revenues enjoyed by churchmen can be disposed of according to the discretion of the recipient as freely as the proceeds of private property. After heresy, simony, and sorcery, the heaviest charge which could be leveled against a churchman was that of avarice, and a covetous priest who hoarded his revenues was lucky if the charge of avarice was not coupled with those graver vices to which I have referred. We may be certain, too, that the duty which was so generally imposed on them by public opinion—the force of which is not yet extinct—was inculcated by them on others. In times of plenty, too, food was often given with wages. A wealthy monastery or college would find a place at the servants' table for the artisans whom they employed without much grudging, and still more would the poor at the gate not be sent away empty-handed. Where mendicancy was no disgrace, almsgiving was like to be considered the most necessary and the most ordinary of the virtues.

"It has been often said and often denied that the monasteries supplied the want which the poor law, two generations after the dissolution of these bodies, enforced. That the monasteries were renowned for their almsgiving is certain. The duty of aiding the needy was universal. Themselves the creatures of charity, they could not deny to others that on which they subsisted. But some orders were under special duties. The Hospitalers were bound to relieve casual destitution. Hence, when Waynflete procured the surrender of the house of the Oxford Hospitalers, he bound his college to the duties which the surrendered house had performed, duties which, it is almost superfluous to say, were speedily evaded. So again the preaching and begging friars were the nurses of the sick, especially of those who labored under infectious diseases. There were houses where doles of bread and beer were given to all wayfarers, houses where the sick were tended, clothed, and fed, particularly the lepers. There were nunneries, where the nuns were nurses and midwives; and even now the ruins of these houses contain living record of the ancient practices of their inmates in the rare medicinal herbs which are still found within their precincts. In the universal destruction of these establishments, the hardest instruments of Henry's purposes interceded for the retention of

some among the most meritorious, useful, and unblemished of them. It is possible that these institutions created the mendicancy which they relieved, but it cannot be doubted that they assisted much which needed their help" (*Work and Wages*, p. 416).

What an enormous part in the polity of the Middle Ages was played by these monasteries is well known. The estates of the monasteries are said over and over again to have comprised a third of the knight's fees in England. Most of these religious houses were founded before the close of the thirteenth century, many of them in the early ages of the Saxon polity. Only a few were founded in later times. Besides these monastic estates, the bishops and the chapters held large possessions.

Many of the English towns grew up round monasteries. The piety of the converted Saxons led them to spend lavishly in the foundation of these institutions, and the principal part of the documents which have been preserved from a period antecedent to the Conquest refer to these early monasteries. Thus the town of Oxford grew up under the shadow of the great monasteries of St. Frideswide and Osney. Such was the origin of Abingdon, of Reading, of St. Albans, of Coventry, of Durham.

That these centers of religious life were centers also of humble brotherly work is also well known. Says Palgrave's *Dictionary of Political Economy*:

"The lands held by a religious house, at least those in its immediate vicinity, were, as a rule, cultivated by the brotherhood itself, and the personal interest thus devoted to the work produced better results than the enforced labor of bondmen. The evidence of the Domesday survey goes to show that the Church lands were in a higher state of cultivation than other property. The monks also employed themselves in clearing forests, draining marshes, and making roads and bridges (cf. Lingard, i., 267 seq.; Cunningham, *Growth of English Industry and Commerce in the Early and Middle Ages*, p. 64 seq., 1890); and the Cistercian order, through the activity which it displayed in sheep-farming, promoted in a singular degree the production of the staple commodity of England. Through the immense extent of their property, variously estimated in the thirteenth and fourteenth centuries from a quarter to a half of the total landed property of England (Wycliffe, *de Eccl.*, xv., p. 338; cf. Pearson, *History of England*, ii., 497, 1867), the churches and religious houses came to take an important share in the industrial development of the country; and it is acknowledged that the clergy were mild landlords (see generally Stubbs, *Constitutional History*, iii., 562). The attacks of the Lollards upon the landed property of the Church were inspired rather by *a priori* objections to the system itself than by any actual abuses to which it led; and the considerations which Bishop Peacock, writing in the middle of the fifteenth century, alleged on the opposite side are probably in the main just. 'The treuthe is,' he says, 'that the tenementis and alle the possessiouns with her purtenauncis, which the clergie (religiouse or not religiouse) holden and hanen, is better meinteined and susteyned, and into wildirnesse, than kept for falling into nouzt and into wildirnesse, than if the same tenementis and possessiouns with her purtenauncis weren in the handis of grete lordis, or of knyztis, or of squyeres.'

The tenants, occupying the tenementis and possessiouns with purtenauncis and the clergie, ben esilier tretid, lasse discedid, and not greued bi extorcioun, as thei schoulden be, if thei holden the same tenementis and possessiouns of temporal lordis or of knyztis and squyeres.' Among other points in favor of those who held of the Church, Peacock notices that their tenure was less liable to be disturbed than that of those who held under lay lords (*Repressor of Overmuch Blaming of the Clergy*, vol. ii., p. 370 seq., ed. Babington, 1866). It has been noticed by critics least friendly to the medieval Church that it was such causes—the known advantage to the tenant—that did much to reconcile public opinion to the enormous estates held by the Church (Pearson, *History of England*, vol. ii., p. 502; Rogers, vol. i., p. 166). That at the close of the Middle Ages the state of things was somewhat altered, and the abuses which had arisen with respect to the management of Church property called forth well-founded complaints (cf. *Dyalogue betwene a Gentillman and a Husbandman*, 1530, ed. Arber, 1871, p. 134 seq.; *Ballads from Manuscripts*, ed. Furnivall, 1869, vol. i.), need not be denied."

But it was not only manual work that was

performed by the monks and clergy. Says Rogers:

"The clergy, in the widest sense of the term, contained nearly the whole of what we should call the professional classes. The architects, the physicians, the lawyers, the scribes, the teachers of the Middle Ages, were almost always clergymen, and when employed in these callings were rewarded for their services with benefices. We know but few of the men who designed the great cathedrals, churches, and castles of the Middle Ages—those buildings which are the wonder of our age for their vastness, their exquisite proportions, and their equally exquisite detail. But when we do know, as it were by accident, who the builder was, he is almost always a clergyman. It seems as if the skill in architecture, and intimate acquaintance with all which was necessary not only for the design of the structure, but for good workmanship and endurance, were so common an accomplishment, that no one was at the pains to proclaim

The Clergy of the Middle Ages.

his own reputation or to record the reputation of another. It is known that we owe the designs of Rochester Castle and the Tower to one ecclesiastic. It is recorded that William of Wykeham was Edward III.'s architect at Windsor, as well as his own at Winchester and Oxford, and of various handsome churches which were built during his long episcopate. It is probable that Waynflete designed the beautiful buildings at Magdalen College; and it is alleged that Wolsey, in his youth, planned the matchless tower, which has charmed every spectator for nearly four centuries. But no one knows who designed and carried out a thousand of those poems in stone which were the glory of the Middle Ages, and have been made the subjects of servile and stupid imitations in our own.

"The monks were the men of letters in the Middle Ages, the historians, the jurists, the philosophers, the physicians, the students of nature. It is owing to their labors that we know anything of our annals, of the events by which the political history of England is interpreted. They were often frivolous, frequently credulous, but they collected the facts to the best of their ability. It is true that the material which they put into shape is far less in quantity than those voluminous archives are which are preserved in our national collection. But these, tho' of great collateral value, would have but little constructive importance in the absence of the chronicles which the monks compiled. This is abundantly illustrated by the history of the fifteenth century and part of the sixteenth.

"I am convinced that schools were attached to every monastery, and that the extraordinary number of foundation schools established just after the Reformation of 1547 was not a new zeal for a new learning, but the fresh and very inadequate supply of that which had been so suddenly and disastrously extinguished." (*Work and Wages*, p. 162).

And it must be remembered that they were not monks of the lower ranks who did manual and literary work, but ecclesiastics of the highest rank. We find such men as Hilary of Arles one of the leading prelates in the French Church, working in the field. Becket, the Archbishop of Canterbury, when he visited a monastery in harvest did not hesitate to labor in the fields. St. Dunstan is reported to have been an excellent blacksmith.

For what the medieval Church did to put down feuds, to bring in "the peace of God," etc., see CHRISTIANITY AND SOCIAL REFORM. We notice here the influence of the Church upon the State. The political influence of the medieval Church was enormously great. Undoubtedly much of it was due to ambition for temporal power, especially with the Roman see, and wherever her spirit went; but equally undoubtedly, apart from all question of ambition, the medieval Church often used her enormous power, and especially did many of her leading prelates use their commanding influence, to protect the rights of the common people against the aggression both of the barons and of the king. We can cite only a few examples, but they are strewn on every page of medieval history. In

England, Stephen Langton, Archbishop of Canterbury, was the leader and the prime mover in wresting from King Richard the Magna Charta, which has now become the birthright of every Englishman and American. In France, the life of Bernard of Clairvaux is filled with records of masterly and effectual resistance against the wrongs and violence of the barons. In Italy, the political influence of Savonarola, the Dominican monk, can hardly be overestimated, and these are shining illustrations of what was done in a humbler way and on a lesser scale by thousands of brave medieval churchmen. The influence of Wycliffe's poor priests, and above all of John Ball (*q. v.*), must not be forgotten. Says Thorold Rogers:

"The poor priests alone could traverse the country by right, and, without suspicion, advise their followers. They were precisely the persons who could organize resistance among the serfs, could win and keep their confidence, and could be trusted with their subscriptions, their plans, and their communications.

The Poor Priests.

Wycliffe's poor priests had honeycombed the minds of the upland folk with what may be called religious socialism. By Wycliffe's labors the Bible men had been introduced to the new world of the Old Testament, to the history of the human race, to the primeval garden and the young world, where the first parents of all mankind lived by simple toil, and were the ancestors of the proud noble and knight, as well as of the down-trodden serf and despised burgher. They read of the brave times when there was no king in Israel, when every man did that which was right in his own eyes, and sat under his own vine and his own fig-tree, none daring to make him afraid. They read how God, through His prophet, had warned Israel of the evils which would come to them when a king should rule over them, and how speedily this was verified in the conduct of the young Rehoboam, with his depraved and foolish counselors, of how he had been predicted to the people over whom a child should rule. The God of Israel had bade His people be husbandmen, and not mounted knights and men-at-arms. But, most of all, the preacher would dwell on his own prototype, on the man of God, the wise prophet who denounced kings and princes and high priests, and, by God's commission, made them like a potter's vessel in the day of His wrath, or on those bold judges, who were zealous even to slaying. For with this book, so old, yet so new, the peasant preacher—we are told that many learned to read when they were old that they might tell the Bible story—could stir up the souls of these clowns with the true narrative of another people, and would be sure that his way to their hearts and their confidence would be, as it always has been with the leaders of a religious revival, by entirely sympathizing with their wrongs, their sufferings, and their hopes. And when they told them that the lords had determined to drag them back to their old serfdom, the preacher could discourse to them of the natural equality of man, of the fact that all, kings, lords, and priests, live by the fruits of the earth and the labor of the husbandman, and that it would be better for them to die with arms in their hands than to be thrust back, without an effort on their part, into the shameful slavery from which they had been delivered. And as their eyes kindled, and they grasped their staves, he could tell them to keep their ears open for the news of their deliverance, that on the password being given, they were at once to hie to the appointed place, where a great work could be done for God's people by His appointed servant" (*Work and Wages*, p. 254). It is true that the correctness of this view has been questioned, but that it is largely true is perhaps fixed. Green says that in the preaching of John Ball, "the mad priest of Kent," England "first listened to the knell of feudalism and the declaration of the rights of man." For an account of somewhat similar movements on the continent, see BRETHREN OF THE COMMON LIFE; COMMUNISM; MIDDLE AGES, etc. But already in noticing these movements that were reformatory of the Church, as well as of society, we are in the dark days when Rome, led by her earthly ambition and desire for temporal power, had forgotten the life of the spirit; and, first, the papacy itself had grown utterly and scandalously corrupt, and was

completely dominated by worldly policy, and then gradually the poison spread from the head to feet and members till the whole medieval Church, save for reforming movements like those led by Wycliffe, Huss, and Savonarola, became dead in trespasses and sins—the higher clergy profligate mammon-servers, the lower clergy profligate servers of the senses; the monasteries (tho' not always even then) too common centers of vice, the nunneries homes of license for the monks. But on this we need not dwell, tho' it must be remembered in obtaining a true picture of the effect of the medieval Church upon social reform; yet there is little danger in Protestant lands of its being forgotten. We are more apt to forget that the poison of corruption came from the worldliness of Rome, and that for long centuries, even after Rome was herself corrupt, the Catholic Church (in England especially, never wholly subject to Rome) was the great purifying, liberating, civilizing, Christianizing factor of medieval life. For the close relation between many of the medieval trade guilds and the Church, see GUILDS. Almost all guilds had their patron saint and their church, where they went for solemn worship, and whose clergy took an active interest in their life, religion and business being continually interblended in medieval life.

4. FROM THE REFORMATION TO THE PRESENT TIME.

With the Reformation, or at least soon after, when the principles of the Reformation had become well established in reformed countries, we have a great change in the history of the *Church* and social reform. That Protestantism, by reaching the *individual*, has along certain lines done much for social reform, no thoughtful man can deny. But the Protestant churches as a whole accomplished but little. Rome, too, since the Reformation has done until recently even less. The Reformation, in its appeal to personal faith, to the right of private judgment, to the letter of the Scriptures, had largely the effect, *both on Roman and Protestant churches*, of exalting belief, creeds, dogma, and discussion above life. It divided Protestantism into so many sects, each discussing and battling to sustain its own peculiar belief and separate church machinery, as to cause the reform of the social life to be until recently almost forgotten. This, too, has been intensified by two other elements in Protestant faith. First, its exaltation of what it calls "the spiritual life," largely meaning by this a life that finds its chief interest in the life hereafter, leading to what has been well called "*other worldliness*;" and secondly, the tendency to *individualism*. This combination of tendencies in Protestant thought has at times almost wholly divorced Church life from the life of this world; and it is therefore no wonder that in the history of THE CHURCH AND SOCIAL REFORM we have after the Reformation nearly a blank. There are, however, exceptions to be noted. First, the early Protestants—for example, the Anabaptists of Germany—referring directly to the New Testament, learned there of its communism, and not a few attempts were made to reproduce it. It has led to a long series of Protestant attempts at communism (see article COMMUNISM), some of them very successful—for example, the Shakers (*q.v.*). But, in the first place, these attempts were made by sects, and therefore were so limited by various narrow and peculiar doctrinal requirements as to very materially limit their influence; while *secondly*, they were based on the belief that

Christians must go out from the world and be *separate*, rather than on the Catholic doctrine that the whole world is God's, and the duty of Christians is to remain *in* the world, tho' not of it, and to bring it wholly into subjection to its King. The second exception to the divorce between the Protestant churches and the social life was in the attempt of many of the first Protestant leaders, such as Calvin, Cromwell, and the Pilgrim Fathers in America, to set up a theocracy on earth, with their particular church organization as the interpreter of the Divine will. These efforts have passed into history, and are now as much marked by their complete failure and their renunciation by all Protestant sects as they were once marked by intense faith in their efficacy. The attempts belong to the first years of Protestantism, when its principles were held in the glow of enthusiasm, fanned by persecution and martyrdom. Protestantism, as soon as it reached its logical outcome, conceived this world for the most part to be "a dreary wilderness," from which the individual is saved by the efficacy of his personal faith in the atoning blood of Christ; Christianity to be the salvation of the individual soul, and the Church to be but the coming together of the individuals who are being saved. While later Protestant thought in Unitarianism and even in orthodox circles has given up much of this soteriology, still the divorce of the Church from practical social matters, has until recently remained. The individualism of Protestantism is admitted by friend and declared by foe. As applied to economics, it had its good and its bad effect. Undoubtedly it has produced a period through which both the world and the Church had to pass. Economic and religious individualism are largely identical. Says Palgrave's *Dictionary of Political Economy*:

"Guizot, Seebohm, K. Marx, and E. de Laveleye declare alike that the 'history of capital and the supremacy of private interest,' *i.e.*, commerce in its modern aspect, commenced contemporaneously with the period of the Reformation, accompanied, as that movement was, by many discoveries and inventions, and the recovered sense of personal freedom and responsibility. In *Protestantism and Catholicism in their Bearing upon the Liberty and Prosperity of Nations*, by Emile de Laveleye (1875), the progress of economic enterprise is attributed to the superior education and enlightenment fostered by Protestantism. De Tocqueville ascribes to the Puritan discipline of the first settlers the same result in the commercial expansion of the United States. From Luther to Protestant divines of the present day the moral force of the dignity of labor and the duty of cheerful exertion in the subduing the earth by economic effort have been held up to admiration, and have given an impulse to the economic life of Protestant countries. The *Wealth of Nations* appeared in 1775-76, and marks a revolution of thought as truly as in the world of industry. 'The machine is somewhat in the nature of Protestantism,' says Dean Uhlhorn in his brochure on *Katholicismus und Protestantismus gegenüber der sozialen Frage* (1887). Private property is encouraged by Protestantism. Luther, in his *Sermon on Usury* (1570), speaks of three grades 'of dealing well and worthily with temporal goods.' The highest is to allow ourselves to be despoiled of it without offering opposition; the lowest is to take neither profit nor interest, tho' he sees objections to this ideal being realized. While Erasmus complained of the 'rage of ownership,' Protestantism endeavored to make a compromise, maintaining the ideal in theory and encouraging what Fr. A. Lange calls a 'moderate egoism,' or 'ethical materialism,' in practice (see *Geschichte des Materialismus*, i., 254, 294. Cf. J. E. Thor-

Reformation.

old Rogers on *The Economic Interpretation of History*, 1888, p. 83). Liberation of industry follows logically from that of liberty of thought, developing the five points of industrial independence—freedom of labor, free trade in land, free movement of capital, freedom of industrial enterprise, and a free market regulated by demand and supply; it further implies the removal of all governmental and trade restrictions—in a word, *Laissez-faire*. Individualism in religion and in industry go together."

It is not therefore strange that slavery, suppressed in Europe by the medieval Church, reappeared in the slave trade after the Reformation, practised by both Protestant and Roman peoples. It is not strange that all the evils which are laid at the door of individualism and competition should be largely condoned, sometimes defended, and at least allowed and not seldom practised by individualistic and competing churches. Individual Protestants like Wilberforce, and Howard, and Chalmers, and Shaftesbury, and Garrison (for at least in Garrison's early reform days he was a believer in the Church), and Gough, and a long list of noble Protestants may have done much for social reform, and no one can challenge the effect upon the daily moral life of Protestantism among the Scotch Covenanters, the English and American Puritans, or the more ordinary life of many a parish in Scotland or town in New England (such as Northampton, Mass., under Edwards, when nearly the entire population were in church every Sabbath, and 600 out of a population of 1100 were members of the Church); yet the point is only too well sustained that the Protestant churches as organizations have had little to do with social reforms.

5. THE MODERN CHURCH.

With the modern Church we reach a new era. The Church of to-day can by no means be fairly accused of doing nothing for humanity. Those who accuse it, as many do in unsparring terms, of being separated from the masses and not battling for social reform, mean that it does not battle for certain ideas of reform. For

Activity of the Church.

charity and in certain lines of reform the Church, in all its history, never accomplished more than to-day. If charity (in the modern sense) be the fulfilling of the law, no one acquainted with the facts can condemn the Church. And

this should not be forgotten even by those who do not believe that such charity is the fulfilling of the law. Those who would put justice before charity must themselves be just enough to give the Church credit for what she is doing. The real state of the case seems to be not that the Church is inactive, for she is immensely active, but that she is not active along the lines most needed in the opinion of most progressive thinkers. We shall therefore point out here the lines upon which the modern Church is active, and in the next section point out the position she might take.

We cannot here enter into details concerning separate churches and church organizations. For these see ANGLICAN POSITION, BAPTIST, CONGREGATIONALIST, METHODIST, PRESBYTERIAN, PROTESTANT EPISCOPAL, ROMAN CATHOLIC, UNITARIAN, and UNIVERSALIST CHURCHES in their relation to social reform. We consider here only those activities which hold more or less true of all churches.

The first of these is the marked activity of the churches in sustaining our great charitable institutions. Especially in our larger cities, like New York, our great hospitals, for example, are almost solely due to the churches. Many of our best educational institutions, too, are the direct offspring of our churches (see CHARITY ORGANIZATION SOCIETIES; HOSPITALS; EDUCATION, etc.). The immense activity of the Church in these respects can hardly be realized, save

by a detailed study, and if one adds to this the enormous benefactions given, the sums contributed, and the charities and institutions founded by individual members of the Church, and largely as the result of the constant, quiet teaching and incitation of Christian pulpits, the influence of the Church for the social uplift of humanity can scarcely be exaggerated.

Second, in spite of severe criticism from those who believe that our churches, or at least church-members, are guilty in supporting political parties wedded to the saloon interest, it cannot be denied that in other ways at least our churches are exerting a vast influence for *temperance* (see TEMPERANCE; PROHIBITION; WOMAN'S CHRISTIAN TEMPERANCE UNION; CHURCH TEMPERANCE SOCIETY, etc.).

Thirdly, the churches are exerting a growing social influence through the development of numerous so-called "institutional churches," where charities and classes and clubs and benefit societies are developed and maintained of the most various kinds, and largely on the lines of social reform. These will be noticed in more detail in the articles on the several churches. We here refer only to such churches and institutions as the East Side House of St. Bartholomew's Church, New York City; the work at St. George's, in the same city; at Berkeley Temple, Boston; the People's Palace, Jersey City; the Temple College, connected with Grace Church, Philadelphia; the Church of the Paulist Fathers, in New York City; in London, the Oxford House, Mansfield House, Newman House, and numberless others in all the important cities and towns of Europe or America. For Germany and France, see article CHRISTIAN SOCIALISM.

Fourthly, many general movements for social reform, like the social work of the Salvation Army, the immensely important educational work of the Chautauqua movement, of the University Extension, the battle for Social Purity, the Social Settlement Idea—these and a hundred others are, first, the indirect result of Church teaching and, secondly, very largely supported by Church people, and not seldom directly in connection with the Church.

Fifthly, the main influence of the modern Church on Social Reform we have yet to notice in its deep, vital influence through the development of individual character. That the *whole* present influence of the Church upon character is good many may doubt; that the total effect of its influence is good a few radicals may question; but that the Church helps to develop purity, kindness, filial and marital love, general honesty, patriotism, temperance, the sacredness of life, the supremacy of duty, and that these are immensely important social forces, no man can deny. It is frequently said that the main work of the Church is not to teach social reform, but to prepare and move individuals to develop social reform. Into this private fundamental work, however, in an encyclopædia of Social Reform we cannot largely enter; yet must it never be forgotten by those who would ask what the Church is doing.

Often those who condemn the Church know her only as she was twenty or more years ago, and know not that a wholly new life and spirit have entered into her to-day. And yet no fair reviewer of the question can deny that along certain lines the Church is far from being or doing what she should. Almost all social thinkers are now agreed that the social evils of the day arise in large part from social wrongs, in monopolies of land, of money, of machinery, of railroads, and of capital of other kinds. They are also all agreed that whatever be their especial economic views, in some way society has a large part to play in righting these wrongs, and that such reforms are therefore at present needed as much as the personal charities and activities of the Church. Now it is in this large field that the Church does so little. Many earnest churchmen claim that this is a field which the Church should not enter. But this is exactly the difficulty urged by social reformers. They claim that the Church has no adequate conception of what she could and should do. If Jesus Christ be the King of all life (see

Failure of the Church.

CHRISTIANITY AND SOCIAL REFORM), surely the Church, as working for Him, should demand that all life obey Christ, and surely the political, social, and industrial spheres are a part of human life. It is more than hinted that while the churches do much for charity (often, however, in their wealth giving of that which costs them little), they fear to take up these fundamental social questions because they have become identified with and dependent upon wealthy donors interested in sustaining these private and class monopolies. City clergymen, with their (often) large salaries and luxurious homes, are especially scorned, hated, and denounced by working men, who claim that these men are not true followers of the Nazarene Carpenter. "We denounce and leave the Church," say these labor leaders, "not because it is Christian, but precisely because it is *not* Christian." In these lines it is easy to see how, in spite of their growing activities, the churches are still denounced as false to their pretended creed and duty. Nevertheless even on this line there is a great change. Under articles CHRISTIAN SOCIALISM and the respective articles on the various Christian churches will be found much evidence of this. Clergymen of all denominations are coming to see that Christ really meant His kingdom to come on earth and all kingdoms of this earth, including the kingdoms of politics, trade, industry, etc., to become a portion of His kingdom. It is significant that a new policy is proposed for foreign and home missions, whereby the Church should organize its converts into Christian, industrial and social communities, as indeed the Moravian missionaries have long done. Certainly a new life is in the Church, altho when one realizes the social need and the power that is in the Christ the Church professes to serve, the little done seems lost in the undone vast. (See also CHURCH AND THE WORKING MEN.)

6. THE GENERAL POSSIBLE RELATIONS OF THE CHURCH TO SOCIAL REFORM.

The Church either has taken or may take at least six possible positions in relation to social reform.

1. It is claimed that the Church has no relation to social reform; that the only mission of the Church is to rescue individual souls from a perishing world, and save them for a spirit life to come. This, tho not often nakedly admitted in words, is a position, as we have seen, that has often been taken in the past and is still not unfrequently practically taken by many Protestant churches and sects to-day. It is, however, now given up, in words at least, by almost all educated and thoughtful Christians, and needs small consideration. The Christ who fed the hungry, healed the sick, and prayed that His kingdom might come on earth, surely never meant His Church to neglect the bodies and earthly relationship of men.

"Think of that long series of works of Christ which are generally now called 'miracles,' but which St. John, at any rate, used to call 'signs,' significant acts showing what kind of a person Christ was, and what He wished His followers to be; and you will find—

without troubling for the moment how they were done, but merely considering what all those who believe they happened are bound to learn from them—that they were all distinctly secular, socialistic works: works for health against disease, works restoring beauty and harmony and pleasure where there had been ugliness and discord and misery, works taking care to see that the people were properly fed, works subduing nature to the human good, works showing that mirth and joy have a true place in our life here, works also showing that premature death has no right here."

2. It is claimed that while a new social era shall come on earth, it will only come with the personal advent of Christ, or can only be realized by prayer and spiritual development, so that practically the Church to-day has nothing to do for distinctively social reform. This position in effect and sometimes in words is taken by many Adventists and so-called Holiness people, and by not a few in churches nominally not holding to these views. It is almost as demoralizing a position as the first. As the first position de-thrones God in *this* world, so this position cuts the nerve of Christian activity and makes the Christian not a worker for the coming of the kingdom, but a parasite without healthy life. Christ said to His disciples, "Go ye into all the world." He bade them heal the sick, feed the hungry, clothe the naked. Undoubtedly the true Christian will depend on Christ for his power, but this is no excuse for the lack of action and obedience to Christ's command. Christ did the wonderful secular works we have noticed above, and then said to His disciples, "He that believeth on Me, works that I do shall he do also, and greater works than these shall he do."

3. The Church may claim that while it should work, its work is to be confined to the individual; that only by saving individuals and building them up into a true character can it finally save society, so that for a society as a whole the Church has no message or duty. This position is not unfrequently asserted, and is continually acted upon. It is the distinctively Protestant conception. Undoubtedly the Church's first message and first work is for the individual; but if society be a portion of human life, and Jesus Christ be the rightful King of all life, He has a law and ideal for society which the Church must declare and strive to realize. Perfecting only individuals is to attempt to build up a temple by polishing the bricks, but forgetting the mortar which binds them together. Humanity *is* an organism. It has one father. We *are* brothers, and our brothers' keepers. No one can live alone. We *are* affected by environment. When open sewers are running through the streets it is folly merely to tell the individual to live a healthy life. The community has a duty to perform—to close the sewer—and *as a community* to obey the laws of health. So there is a social morality and a social Christianity which the Church must teach, and to which it must lead. Too often the position that the Church has only a duty to the individual is a mere excuse for not performing unpleasant social duties. On the other hand, it is not to be forgotten that because the Church has a social duty this must not be made the occa-

**To Reach
the World
through the
Individual
Alone.**

sion, as it sometimes is, of neglecting personal spirituality.

4. The position may be taken that the Church has a social duty to perform, and that since there is no true life apart from religion, the Church should build up an ecclesiastical social life, and have naught to do with the so-called secular institutions of society or State. This is a position that has led to notable movements in history—the various efforts at organizing church communisms and church theocracies.

**To Develop
Church
Social
Institutions.**

It is involved in the position of the temporal power of the Church of Rome. It is the tendency to-day which is developing so much institutional Christianity, and which, *if rightly balanced by other conceptions, is wholly good.* Christ undoubtedly bids His disciples to feed the hungry and clothe the naked and develop true social (including industrial) life. But it must be remembered that if Christ is the King of all life, and if the State is to be, the State must be Christianized, and therefore the Church has a mission to the State as well as practical work to do by herself. "Much can be done by churchmen who remember that the State is a sacred organization as well as the Church. They can unite with socialists of every sort in their endeavor to seize the State and to use it for the well-being of the masses instead of the classes."

5. Men can go to the contrary extreme and say that since the State should be Christian, the Church is not so much to build up Christian institutions herself as to be the spiritual inner life in the State, that shall induce the State to develop such institutions. This is to an extent the medieval and Catholic conception of the Church. According to

**To Work
through
the State.**

this conception, the Church is to be the witness, the voice, the conscience, the soul, of which the State is the body, and the State (municipal or national) is therefore rather than the Church the hand which is to build the true social structure. This may be perhaps the highest ideal of the Church of the future, when the State shall be truly Christianized; but till the State be truly Christian—and the best States are far from this now—the Church certainly has not only a social message to deliver, but a social work to do. This position also is in especial danger of degenerating into the mere preaching of platitudes and glittering generalities. If the Church is to be the conscience and soul of the nation, it must not only bid the nation be good, but declare in definite cases what is the path of right.

6. The truest position is probably one which finds some truth in all the above views, even in the crudest, and works in every way to build up the kingdom of heaven.

In an address upon *The Needs of the City*, before the Evangelical Alliance, convened in Boston, December 4, 1889, Professor Ely suggested the following needs, which in themselves show what the Church could do on especial municipal problems. Professor Ely mentioned the need

1. Of a profound revival of religion, not in any narrow or technical sense, but in the broadest, largest, fullest sense, a great religious awakening which shall

shake things, going down into the depths of men's lives and modifying their character. The city needs religion, and without religion the salvation of the city is impossible.
